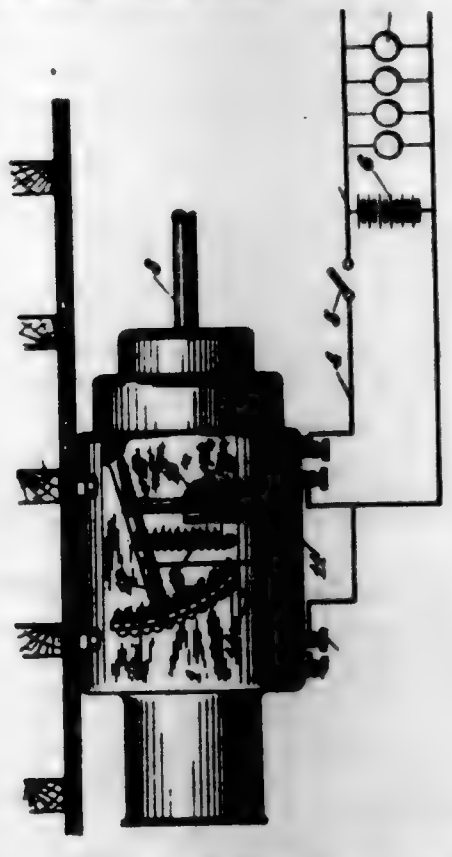
4. In a car-lighting system, the combination of a series of cars, gas-lighting systems carried by the respective cars, an electrical system of distribution carried by the respective cars, a dynamo, and a gas-engine fed by train-pipes in communication with the gas systems of the respective cars.

5. A series of train-lighting units, each comprising a mutually-independent gas and electric lighting system, and a gas-engine and dynamo forming a connection between the gas-lighting and electric-lighting systems whereby the same are rendered interdependent.

6. A train-lighting system, comprising a series of units in detachable connection with each other, each unit being provided with a gas-lighting system and a system of electrical distribution, mutually independent of each other, a generator for the systems of electrical distribution and a gas-motor for driving the generator, fed from gas-lighting systems of the respective units.

704,696. MEANS FOR REGULATING THE OUTPUT OF DYNAMO-ELECTRIC MACHINES. John L. Creveling, New York, N. Y. Filed June 12, 1901. Serial No. 64,300. (No model.)



Claim.—1. A dynamo-electric machine combined with means for regulating its output comprised in part by a heat-influenced element in heat-receiving relation with the machine.

2. An electric generator combined with regulating means therefor, comprised in part by a movable element and means for moving said element under the influence of heat developed in operating the machine.

3. A dynamo-electric machine combined with a regulating device therefor, comprised in part by means for regulating the degree of field excitation by the degree of heat developed by the machine.

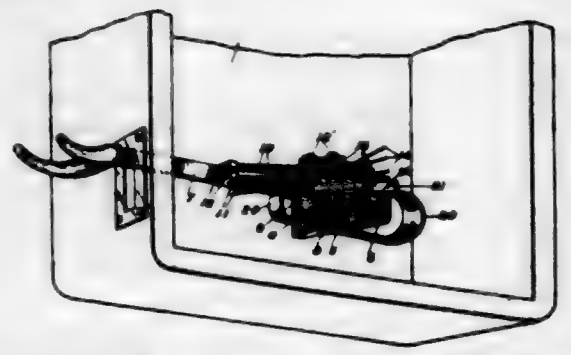
4. A shunt-wound dynamo combined with means for regulating the shunt-field by heat developed in the machine.

5. A generator provided with a heat-operated regulator in heat-conducting communication with the machine.

6. A generator combined with a heat-operated regulating-switch whose extent of operation is a function of the heat developed in the operation of the machine.

7. A dynamo-electric-machine regulator comprising a variable resistance in circuit with the machine and means for varying the resistance by the degree of heat developed in the operation of the machine.

704,697. TELEPHONE HOOK-SWITCH. William W. Dean, Chicago, Ill., assignor to Kellogg Switchboard and Supply Company, Chicago, Ill., a Corporation of Illinois. Filed May 9, 1901. Serial No. 59,474. (No model.)



Claim.—1. In a telephone hook-switch, the combination with a single integral metallic support, of a hook-lever pivoted upon said support, a group of circuit-changing contact-springs and alternately-disposed insulating material directly mounted upon said support, and means for changing said springs from signaling position to talking position, and vice versa by the hook, substantially as described.

2. In a telephone hook-switch, the combination with a metallic supporting-standard, of a hook-lever pivoted upon said standard, a group of circuit-changing contact-springs and alternately-disposed insulating material, means for securing said group of springs together, said means also serving to clamp said group of springs to the support, one of said springs projecting beyond the others, and a lug upon the switch-hook to engage said projecting spring to change the set from signaling to talking position, and vice versa, in the operation of the hook, substantially as described.

3. In a telephone hook-switch, the combination with a metallic support, of a hook-lever pivoted upon said support, a group of circuit-changing contact-springs and alternately-disposed insulating material, screws for securing said springs and strips together and to said support, said springs adapted to be operated by said hook-lever, and a lifting-spring for said hook-lever, the electric circuits being completed through said contact-springs independently of the lever and lifting-spring, substantially as described.

4. In a telephone hook-switch, the combination with a metallic support, provided with pivot-ears and a ledge at one side of said ears, of a hook-lever pivoted in said ears and carrying a slotted lug, switch-springs mounted upon said ledge parallel with said hook and having their free ends adjacent said lug, one of said springs being longer than the others and extending into the slot of said lug, whereby the springs are changed from signaling to talking positions, and vice versa, by the operation of the hook, substantially as described.

5. In a telephone hook-switch, the combination with a metallic support, of a hook-lever pivoted upon said support, a ledge on said support, a plurality of superimposed switch-contact springs, with insulating-strips therebetween mounted upon said ledge, a readily-removable means to clamp and bind said springs and strips in place whereby their number may be readily varied, one of said springs being extended to engage the telephone-hook to change them from signaling to talking position and vice versa in the operation of the hook, substantially as described.

6. In a telephone hook-switch, the combination with a metallic support, of a hook-lever pivoted upon said support, a group of circuit-changing contact-springs and alternately-disposed insulating material directly mounted upon said support, and adapted to be operated by the hook, and a lifting-spring secured to said support and adapted to lift the said hook-lever, substantially as described.

7. In a telephone hook-switch, the combination with a metallic support provided with ledges, of a hook-lever pivoted upon said support, a set of switch-springs mounted upon one of said ledges and adapted to lie alongside the hook-lever and to be operated thereby to change the circuits from talking to signaling positions, and vice versa, and a leaf-spring secured at one end to the other ledge and engaging the hook-lever with its free end to lift the same, substantially as described.

8. In a telephone hook-switch, the combination with a single integral metallic support, of a hook-lever mounted upon said support, a group of circuit-changing contact-springs also mounted upon said support, said lever being arranged to operate said springs from a point between the pivot and free end of the lever, substantially as described.

9. In a telephone hook-switch, the combination with a single integral support, of a hook-lever pivoted upon said support, a group of cir-

cuit-changing contact-springs and alternately-disposed insulating material directly mounted upon said support, said lever being arranged to operate said springs from a point between the pivot and free end of the lever, substantially as described.

10. In a telephone hook-switch, the combination with a single integral support, of a hook-lever pivoted upon said support, a group of circuit-changing contact-springs and alternately-disposed insulating material directly mounted upon said support and out of the plane of vibration of the hook-lever, and means for operating said springs by said hook-lever, substantially as described.

11. In a telephone hook-switch, the combination with a single integral metallic support, of a hook-lever pivoted thereto, a group of circuit-changing contact-springs also mounted upon said support and out of the plane of vibration of the hook-lever, and means for changing said springs from one position to another by the hook, substantially as described.

12. In a telephone hook-switch, the combination with a support, of a hook-lever pivoted thereto, a group of circuit-changing contact-springs mounted upon said support out of the plane of vibration of said lever, and means connected with the lever between its pivot and free end for operating said springs, substantially as described.

13. In a telephone hook-switch, the combination with a support, of a hook-lever pivoted thereto, a group of circuit-changing contact-springs mounted upon said support at the side of said lever and extending substantially parallel thereto, and means connected with the lever between its pivot and free end for operating said springs, substantially as described.

14. In a telephone hook-switch, the combination with a metallic support, of a hook-lever pivoted upon said support, a group of circuit-changing contact-springs and alternately-disposed insulating material directly mounted upon said support, and means for positively operating said springs in both directions by the hook, substantially as described.

15. In a telephone hook-switch, the combination with a metallic supporting-standard, of a hook-lever pivoted upon said standard, a group of circuit-changing contact-springs and alternately-disposed insulating material, means for securing said group of springs together, said means also serving to clamp said group of springs to the support, one of said springs projecting beyond the others and adapted to engage the switch-hook whereby the springs are positively moved from talking to signaling position, and vice versa, by the hook, substantially as described.

16. In a telephone hook-switch, the combination with a metallic supporting-standard, of a hook-lever pivoted upon said standard, a group of circuit-changing contact-springs and alternately-disposed insulating material, means for securing said group of springs together, said means also serving to clamp said group of springs to the support, one of said springs projecting beyond the others, said hook being adapted to transversely engage said projecting spring to change the group from one position to another in the operation of the hook, substantially as described.

17. In a telephone hook-switch, the combination with a single integral metallic support, of a hook-lever pivoted upon said support, a group of circuit-changing contact-springs and alternately-disposed insulating material directly mounted upon said support, and means for changing said springs from signaling position to talking position, and vice versa, controlled by the hook, substantially as described.

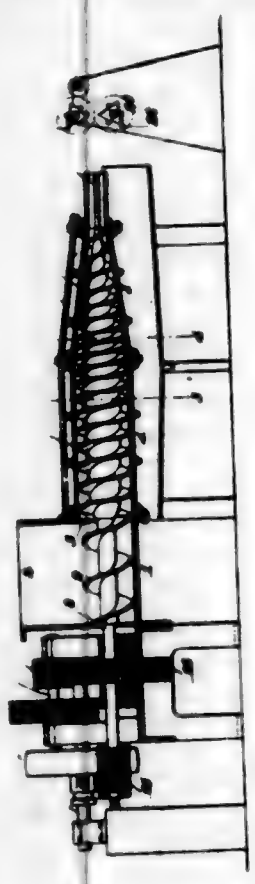
18. In a telephone hook-switch, the combination with a single integral metallic support, of a hook-lever pivoted upon said support, a group of circuit-changing contact-springs and alternately-disposed insulating material directly mounted upon said support, and means tending to cause said lever to rise, said springs being controlled by the hook, substantially as described.

19. In a telephone hook-switch, the combination with a metallic supporting-standard, of a hook-lever pivoted upon said standard, a group of circuit-changing contact-springs and alternately-disposed insulating material, means for securing said group of springs together, said means also serving to clamp said group of springs to the support, one of said springs projecting beyond the others, a projection upon the hook to engage said projecting spring to control the set in changing from signaling to talking position, and vice versa, and means to exert an upward spring-pressure upon the hook, substantially as described.

20. In a telephone hook-switch, the combination with a support, of a hook-lever pivoted upon said support, a group of circuit-changing contact-springs and alternately-disposed insulating material directly mounted upon said support and extending substantially parallel with the switch-hook lever, said group of springs being out of the plane of vibration of the hook-lever, and means for operating said springs by the hook-lever, substantially as described.

21. In a telephone hook-switch, the combination with a metallic support, of a hook-lever pivoted upon said support, a group of circuit-changing contact-springs and alternately-disposed insulating material directly mounted upon said support, and independent means tending to cause said lever to rise, said springs being controlled by the hook, substantially as described.

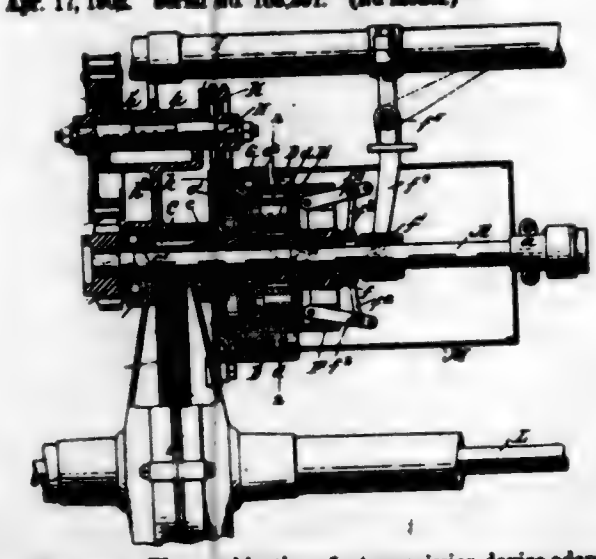
704,698. PROCESS OF TREATING FIBERS OF ANNUAL GROWTH FOR INDUSTRIAL PURPOSES. SIMEON O. EDISON, East Orange, N. J. Filed June 19, 1900. Serial No. 20,813. (No specimens.)



Claim.—1. The process of treating straw and other annual vegetable fibers for converting them into combustible briquets, consisting in cooking the fibers by subjecting them to the effect of a moist heat until the fibers are softened but have not entirely lost their identity, and finally in simultaneously expressing water from the mass and compressing the mass into combustible blocks, substantially as and for the purposes set forth.

2. The process of treating straw and other annual vegetable fibers for converting them into combustible briquets, consisting in cooking the fibers by subjecting them to the effect of a moist heat until the fibers are softened but have not entirely lost their identity, in simultaneously expressing water from the mass so treated and forming the mass into a continuous longitudinally-moving body, and in finally cutting such body by cross-cuts into blocks of the desired length, substantially as set forth.

704,699. TRANSMISSION-GEAR. DAVID FERGUSON, Buffalo, N. Y., assignor to the George N. Pierce Company, Buffalo, N. Y. Filed Apr. 17, 1902. Serial No. 103,201. (No model.)



Claim.—1. The combination of a transmission device adapted to be rotated at a constant speed in one direction, a driven element, gearing between said transmission device and driven element and operated by the former for rotating said driven element in one direction at different speeds, a counter-shaft movable toward and from said transmission device and driven by the latter, and gearing between said counter-shaft and said driven element for rotating the latter in the opposite direction, substantially as set forth.

2. The combination of a transmission device adapted to be rotated at a constant speed in one direction, a driven element, gearing between said transmission device and driven element and operated by the former for causing said driven element to rotate in the same direction as said transmission device and at different speeds, a counter-shaft movable toward and from said transmission device and driven by the latter, and gearing between said counter-shaft and said driven element for rotating the latter in a direction opposite to the direction of rotation of said transmission device, substantially as set forth.

3. The combination of a transmission-shaft, a driven element, means operated by said shaft for causing the rotation of said driven element in one direction at different speeds, a counter-shaft movable toward and from said transmission-shaft and driven by the latter, and friction-gearing between said counter-shaft and said driven element for rotating the latter in the opposite direction, substantially as set forth.

4. The combination of a transmission-shaft, a driven pinion rotatable about the axis of said shaft, means for locking said pinion to said shaft and for rotating said pinion independently of said shaft, a counter-shaft, a bearing for said counter-shaft mounted eccentrically to the axis of said counter-shaft and adapted to be moved to move said counter-shaft toward and from said transmission-shaft, means for driving said counter-shaft from said transmission-shaft, and means for transmitting motion from said counter-shaft to said driven pinion, substantially as set forth.

5. The combination of a transmission-shaft, a driven pinion journaled to rotate about the axis of said shaft, means for locking said pinion to said shaft, means for driving said pinion independently of said shaft, a counter-shaft, a bearing for said counter-shaft arranged eccentrically to the axis thereof and adapted to be moved to move said counter-shaft toward and from said transmission-shaft, a sprocket-wheel fixed to said transmission-shaft, a sprocket-wheel fixed to said counter-shaft, a chain connecting said sprocket-wheels, a friction-wheel secured to said counter-shaft, and a friction-wheel fixed to said driven pinion and adapted to be engaged by said friction-wheel secured to said counter-shaft, substantially as set forth.

6. The combination of a transmission-shaft, a hollow shaft rotatable about the axis of said transmission-shaft, means operated by said transmission-shaft for rotating said hollow shaft at different speeds, a counter-shaft driven by said transmission-shaft, a gear-wheel carried by said hollow shaft, a gear-wheel connected to said counter-shaft, and means for moving one of said gear-wheels into operative relation with the other, substantially as set forth.

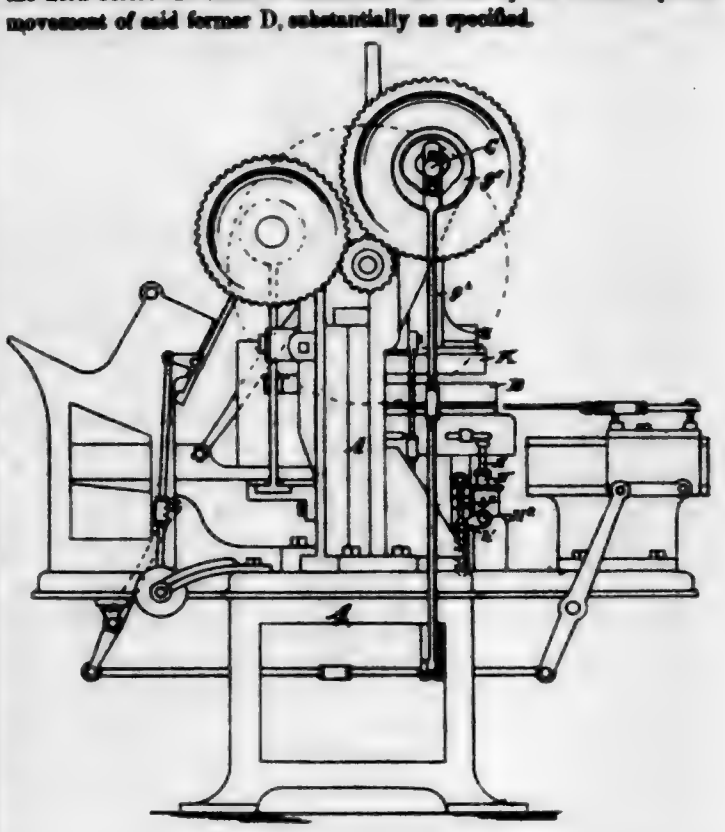
7. The combination of a transmission-shaft, a driving-pinion fixed on said shaft, a driven pinion journaled to rotate about the axis of said transmission-shaft, an internal gear surrounding said driving-pinion, planet-pinions journaled on a part fixed to said driven pinion and meshing with said driving-pinion and with said internal gear, means for locking said internal gear to said transmission-shaft, means for holding said internal gear from rotation, a reversing-shaft journaled parallel to said transmission-shaft and driven by the latter, means for moving the same toward and from the transmission-shaft, a friction-wheel secured to said driven pinion, and a friction-wheel secured to said reversing-shaft and adapted to be moved into frictional contact with said friction-wheel secured to said driven pinion, substantially as set forth.

704,700. CAN-BODY-FORMING MACHINE. JOHN G. ROGERS, Maywood, Ill., assignor, by mesne assignments, to American Can Company, Jersey City, N. J., a Corporation of New Jersey. Filed Oct. 28, 1900. Serial No. 33,906. (No model.)

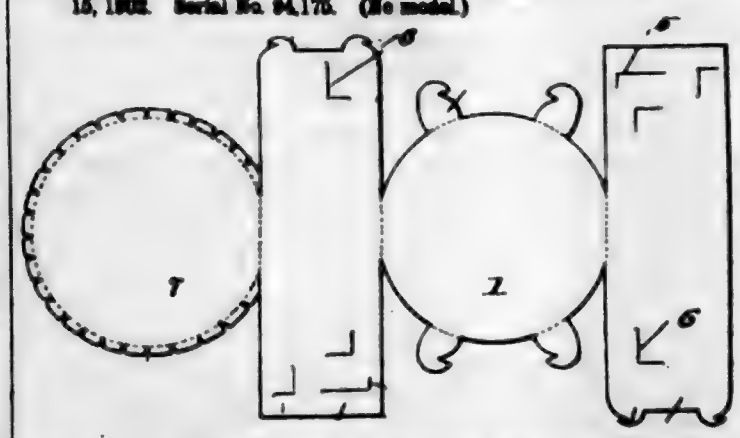
Claim.—1. In a can-body-forming machine, the combination with the horn, of a reciprocating can-body former D below the horn and provided with a central groove *d* therein, guides for supporting the blank below the horn and above said former, and a positively-operated independently-reciprocating clamp F within said groove in the former D for firmly and positively clamping the blank against the horn, the upper edges of said former D supporting the blank as it is lifted thereby against the horn, and said clamp F operating to clamp the blank against the horn before the blank is bent about the horn by the further upward movement of said former D, substantially as specified.

2. In a can-body-forming machine, the combination with the horn, of a reciprocating former D below the horn and provided with a central groove *d* therein, guides for supporting the blank below the horn and above the former, and an independently-reciprocating clamp F fitting within said groove in the former, and mechanism for positively operating the clamp to hold the blank rigidly and firmly against the horn, the upper edges of said former D supporting the blank as it is lifted thereby against the horn, and said clamp F operating to clamp the blank against the horn before the blank is bent about the horn by the further upward movement of said former D, substantially as specified.

3. In a can-body-forming machine, the combination with the horn, of a reciprocating body-former D below the horn provided with a central groove *d* therein, guides for supporting the blank below the horn and above the former, a cam and connecting mechanism for positively reciprocating the former, an independently-reciprocating clamp fitting within said groove in the former D for clamping the blank against the horn, and a cam and connecting mechanism for positively operating said clamp, the upper edges of said former D supporting the blank as it is lifted thereby against the horn, and said clamp F operating to clamp the blank against the horn before the blank is bent about the horn by the further upward movement of said former D, substantially as specified.



704,701. BOX. RAPHAEL JANSSEN, Allegheny, Pa. Filed Feb. 15, 1902. Serial No. 94,175. (No model.)

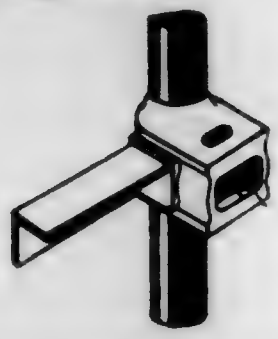


Claim.—In a device of the type set forth, the combination of a base carrying interlocking projections arranged in pairs upon its periphery diametrically opposite one another, sides formed integral with the base diametrically opposite one another, interlocking projections carried by one end of one of the sides and the opposite end of the other of the sides, with an angular slit 6 formed in the said ends of the sides and a series of angular slits 5 formed in the ends of the sides opposite to the ends carrying said projections, and an integral lid having scalloped edges formed integral with one of the sides at a point opposite to its connection with the base, substantially as described.

704,702. BEDSTEAD-FASTENING. BENJAMIN H. JOHNS, St. Louis, Mo., assignor of one-half to Smith & Davis Manufacturing Company, St. Louis, Mo., a Corporation of Missouri. Filed Jan. 20, 1902. Serial No. 90,255. (No model.)

Claim.—1. A bedstead-fastening or the like comprising a socket member having a socket and an opening through one of its plates and opening into said socket, a bracket member having a part adapted to enter said socket, said part having an opening which, when the said members are assembled, lies in substantial alinement with said opening in said socket member, a key movable in said openings and adapted to secure said fastening members together, and a lateral projection upon said key, the opening in said bracket-member part and the portion of said socket-

member opening adjacent said socket being sufficiently large to permit passage of said key and said projection, and the said opening in the said socket member having a contracted portion to prevent passage of said key and projection substantially as described.



2. In a bedstead-fastening or the like, a socket member having a plate provided with an opening having walls upon all of its sides, a bracket member extending into said socket member, and a wedge-key fitting in said opening and engaging said socket member and said bracket member; substantially as described.

704,703. SCENERY-BRACE. FRANK T. LIPPINCOTT, Howard, Ohio. Filed Mar. 24, 1902. Serial No. 99,691. (No model.)

Claim.—1. In a scenery-brace, the combination with a brace-body, a pin 3 connected with said body and a scenery-frame-engaging hook with which said pin is pivotally connected, of a binding-disk 8 carried eccentrically on said pin and adapted to be projected within said hook-body and means for detachably connecting the lower end of said brace-body with a stage-floor.

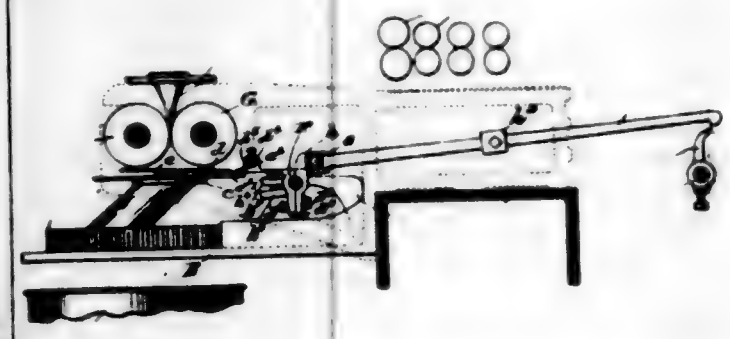
2. In a scenery-brace, the combination of a brace-body, a spring-pressed pin 3 having a hinge connection with the upper portion of said body, a scenery-frame-engaging hook with which said pin is pivotally connected, a binding-disk 8 carried on said pin and adapted to be projected within said hook and means connected with the lower end of the brace-body for detachably engaging the same with a stage-floor, substantially as specified.

3. In a scenery-brace, the combination with a brace-body and a scenery-frame-engaging hook at its upper end, of an angular extension at the base of said brace, a fixed floor-engaging pointed projection 12 on said extension, a pivoted bar 14 having a floor-engaging point and a cam-lever pivoted in connection with said brace extension and adapted by depression to drive the point 14ª of said bar into engagement with a floor, substantially as specified.

4. In a scenery-brace, the combination with a brace-body comprising adjustably-connected upper and lower sections, a scenery-frame-engaging hook having a hinge connection with the upper end of the upper section and an eccentrically-mounted clamping-disk carried by one arm of said hook and adapted to be projected through an opening in said arm, of an angular extension 11 at the base of the lower brace-section, a fixed floor-engaging point and a pivoted point-carrying bar connected with said extension and a pivoted lever adapted to press the point of said pivoted bar into engagement with a floor, substantially as specified.

704,704. STOP-MOTION FOR DRAWING-MACHINES. JOHN T. HEATH and CHARLES R. McELWAIN, Taunton, Mass., assignors to Mason Machine Works, Taunton, Mass., a Corporation of Massachusetts. Filed Mar. 28, 1901. Serial No. 53,513. (No model.)

Claim.—1. In a drawing-frame, a stop-motion therefor, calender-rolls, the coiler, and controlling means for the stop-motion operative by downward pressure upon accumulation of sliver below the calender-rolls and upon said controlling means, and by upward pressure when the can is full.



2. The combination, with the vibrator of a drawing-frame stop-motion, the calender-rolls and the coiler, of a pivoted stop-lever adapted to be rocked by or through the coiler when the can is full, to arrest the motion of the said vibrator, and an auxiliary lever having its free end interposed between the said rolls and the coiler and operative by downward pressure due to accumulation of sliver upon its free end to rock said stop-lever and effect its coöperation with the vibrator.

3. The combination, with the vibrator of a drawing-frame stop-motion, the calender-rolls and the coiler, of means interposed between the said rolls and the coiler, and operative by downward pressure, due to accumulation of sliver directly above said means, and by upward pressure from the coiler when the can is full, to arrest the motion of the vibrator.

4. In a drawing-frame, a stop-motion therefor, the coiler, calender-rolls, a pivotally-mounted full-can stop-lever movable by elevation of the coiler to effect the operation of the stop-motion, and an auxiliary lever connected with the stop-lever between its fulcrum and the coiler, and having its free end extended below the calender-rolls, accumulation of sliver upon the free end of said auxiliary lever acting to depress it and thereby to rock the stop-lever into position to effect the operation of the stop-motion.

5. In a drawing-frame, a stop-motion therefor, the coiler, calender-rolls, a stop-lever having a fixed fulcrum and having its outer end projecting in the upward path of movement of the coiler, and an auxiliary lever fulcrumed between its ends and pivotally connected at one end with the stop-lever near the fulcrum thereof, the outer end of the auxiliary lever extending beneath the calender-rolls, between the latter and the coiler, whereby upward movement of the coiler, or depression of the outer end of the auxiliary lever, by accumulation of sliver thereupon will operate to elevate the outer end of the stop-lever and thereby effect its coöperation with the stop-motion.

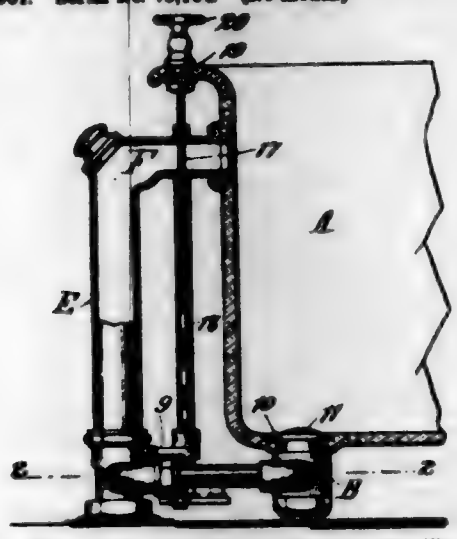
6. In a drawing-frame, the coiler, a stop-motion for the frame, and controlling means for the stop-motion, said means including two independently-fulcrumed levers pivotally connected between their fulcra, direct rocking of one of said levers, upon elevation of the coiler, or indirect rocking of such lever, due to rocking of the other lever by an accumulation of sliver above and upon the same, operating to effect the operation of the stop-motion.

7. In a drawing-frame, a stop-motion therefor, the coiler, and coiler-cover, a stop-lever adapted to be rocked to coöperate with said stop-motion, the outer end of the lever normally resting on the coiler-cover in the vertical path of the coiler, and an auxiliary lever fulcrumed on said coiler-cover and at one end pivotally connected with the stop-lever, the other end of the auxiliary lever being depressed by accumulation of sliver, to rock the stop-lever.

8. In a drawing-frame, the combination with the vibrator of a stop-motion, and a series of coilers, of a rock-shaft having a series of lever-arms each adapted to coöperate with and be lifted by upward movement of a coiler, a lever pivotally connected with each lever-arm and adapted when depressed at its free end to raise the outer end thereof, and rock said shaft upon accumulation of sliver above the coiler and upon the free end of the lever, and a hooked lever-arm mounted on said rock-shaft and brought into engagement with the vibrator to arrest the same when the rock-shaft is rocked.

9. The combination, with the front shaft and the vibrator of a drawing-frame stop-motion, and the coiler, of a hooked lever-arm loosely fulcrumed on the shaft and having a forwardly-extended toe, a finger fast on the shaft, an adjustable stop carried by the finger and engaging the toe, to regulate the setting of said lever-arm, and means to rock the shaft by upward pressure of the coiler, or by downward pressure due to sliver accumulation above the coiler, to effect coöperation of the lever-arm and the vibrator.

704,705. **WASTE-FIXTURE FOR BATH-TUBS OR THE LIKE.** FRANCIS T. MEYER, Montclair, N. J., assignor to The Meyer-Sniffen Company, Limited, New York, N. Y., a Corporation of New York. Filed Aug. 24, 1901. Serial No. 73,164. (No model.)



Claim.—1. The combination with a bath-tub or the like, of a waste connection including two horizontal waste-pipes connecting with the waste-outlet of the tub with a space between them, and waste-operating mechanism located between said pipes, substantially as described.

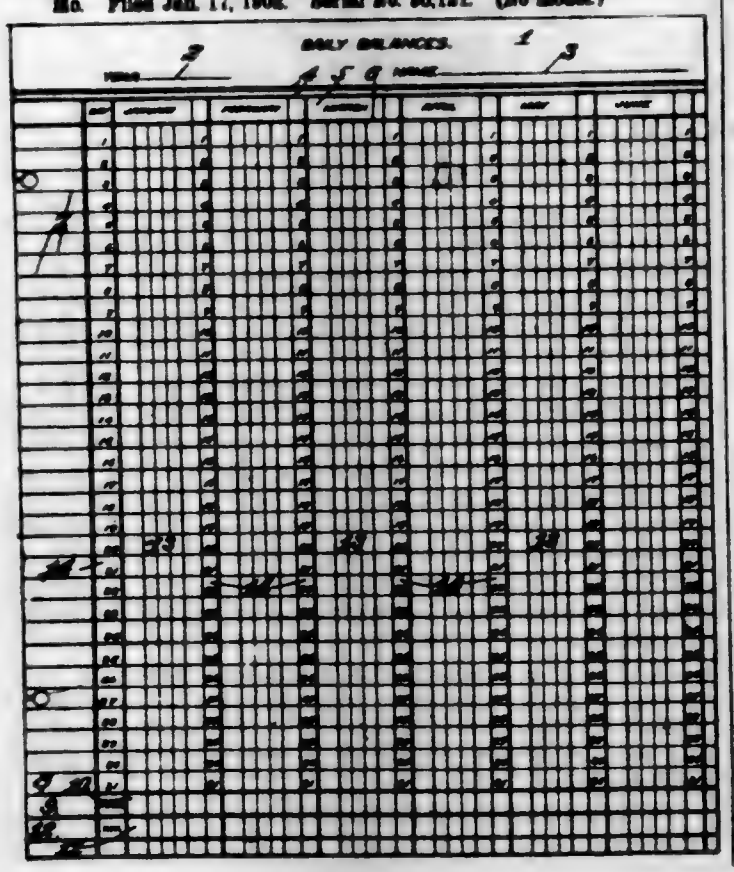
2. The combination with a bath-tub or the like, of a waste connection including two horizontal waste-pipes connecting with the waste-outlet of the tub with a space between them, waste-operating mechanism located between said pipes, and a vertical rod for operating the waste mechanism from above the waste-pipes, substantially as described.

3. The combination with a bath-tub or the like, of a waste connection including two horizontal waste-pipes connecting with the waste-outlet of the tub with a space between them, waste-operating mechanism located between said pipes, a horizontal overflow-pipe, and an operating-rod for the waste mechanism passing through the overflow-pipe, substantially as described.

4. The combination with the bath-tub A having the waste chamber or plug B, horizontal overflow-pipe F, stand-pipe E and waste D, of a plurality of horizontal waste-pipes C connecting the waste chamber or plug B with the waste D, and waste-operating mechanism between said pipes C, substantially as described.

5. The combination with a bath-tub or the like and its waste chamber or plug and the waste D, of waste-operating mechanism located between the waste-plug and waste, and a waste connection between said plug and waste offset from the waste-plug and waste to pass the waste connection, substantially as described.

704,706. **BALANCE-BOOK.** JAMES R. McCORD, Jr., St. Louis, Mo. Filed Jan. 17, 1902. Serial No. 90,121. (No model.)



Claim.—1. A page of the character indicated having a single main line in combination with a plurality of vertical daily-balance columns arranged in proximity to each other, each of said daily-balance columns having a heading indicating a period of time, and each of said columns being provided with a vertical series of appropriately-designated daily-entry spaces; substantially as described.

2. A page of the character indicated having a single name-line in combination with a plurality of vertical daily-balance columns arranged in proximity to each other, each of said daily-balance columns having a heading indicating a period of time, and each of said columns being provided with a vertical series of appropriately-designated daily-entry spaces, each of said columns being also provided with an interest-space; substantially as described.

3. A page of the character indicated having a single name-line in combination with a plurality of vertical daily-balance columns arranged in proximity to each other, each of said daily-balance columns having a heading indicating a period of time, and a vertical index-column in series with said daily-balance columns, a series of horizontal daily-entry spaces extending across said columns and having in said index-column designations for the several days included in the period of time indicated by the headings of the respective daily-balance columns, and horizontal total and interest spaces extending across said daily-balance columns; substantially as described.

704,707. **LEATHER.** MENDEL PIANKO, Woodhaven, N. Y., assignor to North American Leather Company, a Corporation of New York. Filed Apr. 21, 1902. Serial No. 103,863. (No model.)

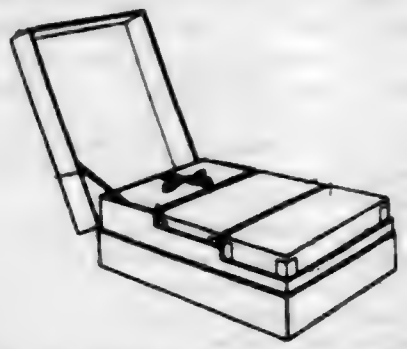
Claim.—1. As a new article of manufacture, a "pebbled" leather comprising a base or bottom layer or fabric, an intermediate layer consisting of leather pebbles of fanciful configuration, and a finishing or top layer, the whole being united by cement and "boarded."

2. As a new article of manufacture a "pebbled" leather comprising a base or bottom split of leather, leather pebbles of fanciful configuration secured upon the surface thereof, and a surface layer or fabric secured upon the base inclosing the pebbles, the whole being cemented and "boarded."

3. As a new article of manufacture, a "pebbled" leather consisting of pebbles secured between two layers of leather.

4. As a new article of manufacture, a "pebbled" leather consisting of pebbles secured between two splits of leather.

704,708. **PACKING AND DISPLAY BOX FOR STATIONERY.** WILLIAM A. PIKE, Pittsfield, Mass., assignor to Eaton-Hurlbut Paper Company, Portland, Me., and Pittsfield, Mass., a Corporation of Maine. Filed May 23, 1901. Serial No. 61,587. (No model.)

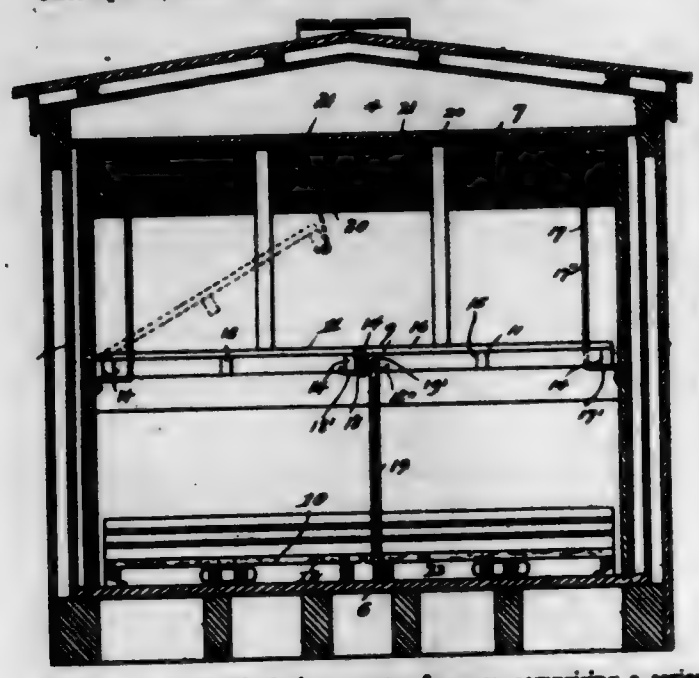


Claim.—1. As an improved article of manufacture a display-box for stationery divided into a plural number of compartments, each compartment being less in height, measuring from the bottom, than the one back of it, filling-pieces forming the bottom of certain of the compartments and filling-pieces for the tops of certain of the compartments arranged, when in place, with their tops in the same plane as the plane of the upper boundary of the highest compartment.

2. As an improved article of manufacture, a display-box for stationery divided into a plural number of compartments, each compartment be-

ing less in height, measuring from the bottom, than the one back of it, filling-pieces forming the bottom of the compartment, and filling-pieces for the tops of the compartments of lesser height.

704,709. DOUBLE-DECK CAR. WILLIAM R. SHARP, Chicago, Ill., assignor to Armour & Company, Chicago, Ill., a Corporation of Illinois. Filed Apr. 14, 1901. Serial No. 55,966. (No model.)



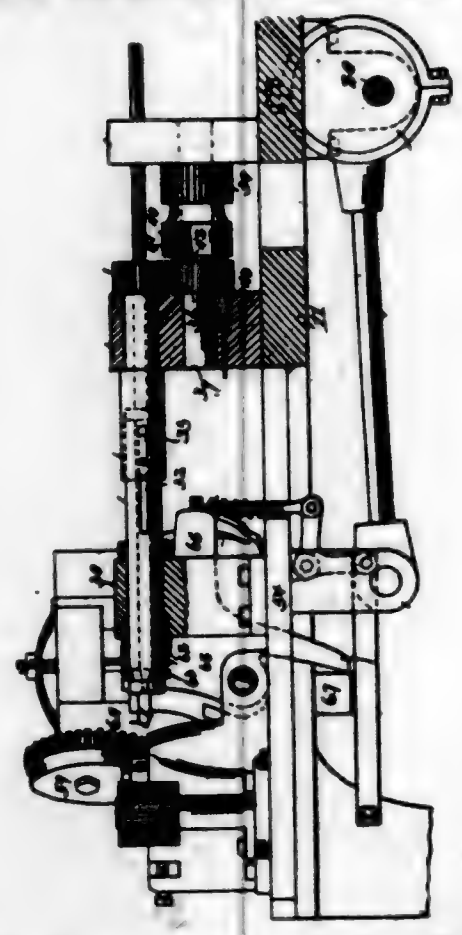
Claim.—1. A double-deck apparatus for cars, comprising a series of vertically-disposed guide-rods arranged adjacent to, but separated from, the side wall of the car, rack-sections at the lower ends of said guide-rods, a series of rack-sections of less width than the transverse width of the car, severally provided along their longitudinal edges next the wall of the car with longitudinally-extending supporting joint members adapted to rest upon said rack-supports between the said guide-rods and the wall of the car, the construction and relative arrangement of said joint and guide-rods being such as to permit the rack-sections to be swung into vertical position and shifted upwardly with their longitudinally-supporting joints between the guide-rods and wall of the car, means for supporting said rack-sections in said vertical and uplifted positions at a height above the floor of the car sufficient to accommodate a similar rack-section arranged in vertical position beneath the same and means for supporting the outer edges of the rack-sections to hold the same in horizontal position.

2. A double-deck apparatus, comprising a series of vertically-disposed guide-rods arranged adjacent to, but separated from, the side wall of the car, rack-sections at the lower ends of said guide-rods, a series of rack-sections of less width than the transverse width of the car, severally provided along their longitudinal edges next the wall of the car with longitudinally-extending supporting joint members adapted to rest upon said rack-supports between the said guide-rods and the wall of the car, the construction and relative arrangement of said joint and guide-rods being such as to permit the rack-sections to be swung into vertical position and shifted upwardly with their longitudinally-supporting joints between the guide-rods and wall of the car, means for supporting said rack-sections in said vertical and uplifted positions at a height above the floor of the car sufficient to accommodate a similar rack-section arranged in vertical position beneath the same and means for supporting the outer edges of the rack-sections to hold the same in horizontal position, and suspension-hooks secured to the ceiling of the car at points respectively above the several rack-sections and adapted to temporarily support the swinging end of the several rack-sections at a height intermediate their normal horizontal position and the ceiling of the car.

3. A double-deck apparatus for cars, comprising a series of vertically-disposed guide-rods arranged adjacent to, but at an interval from the side wall of the car, each guide-rod having at its lower end a horizontal extension extending outwardly to and connected with the side wall and forming a rack-support, a series of rack-sections of less width than the transverse width of the car, each comprising a longitudinally-disposed joint member adjacent to each side margin and a series of transverse slats secured to said joint members, the joint member at the outer edges of said rack-sections being arranged to extend between said guide-rods and the adjacent side wall of the car and adapted to rest upon the rack-supporting portions of said rods, and means for supporting the opposite edges of said rack-sections comprising one or more legs pivotally connected with one member of each pair of laterally opposite sections and respectively adapted to be folded upon the rack-sections when out of use, and projections upon the leg-supported sections adapted to engage and support the opposite meeting sections, substantially as described.

4. A double-deck apparatus for cars, comprising two series of vertically-disposed guide-rods arranged adjacent to, but at an interval from the respective side walls of the car, each guide-rod having at its lower end a horizontal extension extending outwardly to and connected with the side wall and forming a rack-support, two series of rack-sections connected with the respective series of supports, each rack-section of a width approximately equal to one-half the width of the car, and each comprising a longitudinally-disposed joint member adjacent to each side margin and a series of transverse slats secured to said joint members, the joint member at the outer edge of each rack-section being arranged to extend between a pair of said guide-rods and the adjacent side wall of the car and adapted to rest upon the rack-supporting portions of said rods, means for supporting the meeting edges of the said rack-sections comprising plate-like extensions secured to the under side of the joint at the meeting margins of one section and underlying the joint of the laterally opposite section and means for supporting said sections at their meeting margins comprising legs pivotally connected with said plate-like extensions, and adapted to be folded upon the racks when out of use, substantially as described.

704,710. BARBED-WIRE MACHINE. EDW. F. SHELLABERGER, DeKalb, Ill. Filed Mar. 27, 1902. Serial No. 100,322. (No model.)



Claim.—1. In a barbed-wire machine the combination with a stationary frame, a table mounted to slide upon said frame, bearings on the frame and the table respectively, and a two-part spindle, one part of which is mounted in the bearing on the frame and the other in the bearing on the table, a driving-gear fixed on the non-sliding member of the spindle, means for sliding the table and gearing for imparting an intermittent rotary motion to the two-part spindle, substantially as described.

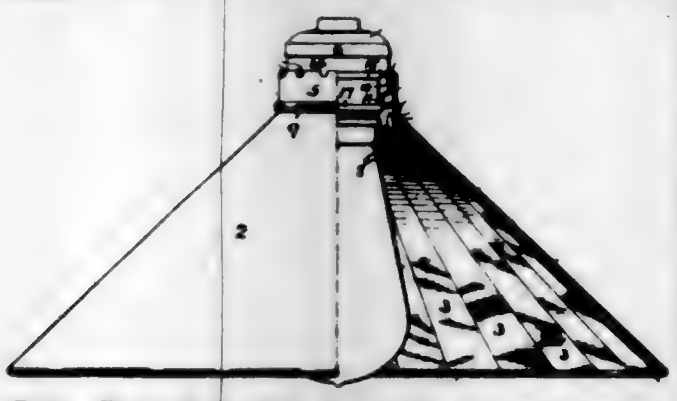
2. In a barbed-wire machine the combination with a two-part spindle the parts of which are connected for rotary movement but adapted to telescope or slide with reference to each other, a gear fixed upon one member of the spindle, a loose gear engaged therewith, a clutch for holding said loose gear against movement in one direction, and a rack and pinion whereby operative rotary movement is imparted to the spindle through the clutch in one direction of movement of the rack, and the loose gear is held against retrograde movement during the opposite movement of the rack.

3. In a barbed-wire machine the combination with an intermittently-rotating spindle, of a clutch-gear for driving said spindle, comprising a constantly-rotating clutch member having a spring-pin, and a cam on the loose gear, and adapted for automatic engagement and release, substantially as described.

4. In a barbed-wire machine the combination with an intermittently-driven spindle, of a loose driving-gear carrying a clutch member, a rec-

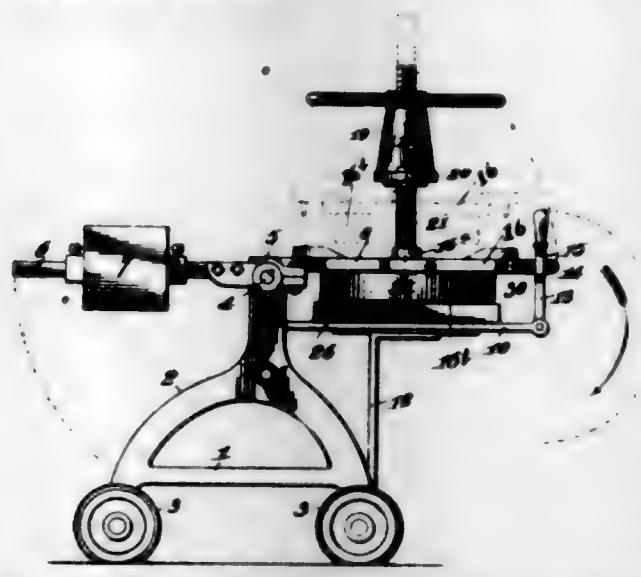
cent clutch member constantly driven, and a spring-actuated locking-pin for holding the loose gear against retrograde movement, substantially as described.

704,711. COMBINED REFLECTOR OR LAMP-SHADE AND COLLAR. JOHN A. CARLSHOT, Brooklyn, N. Y., assignor to George Frink Spencer, Newark, N. J. Filed July 28, 1900. Serial No. 25,073. (No model.)



Claim.—The herein-described socket-receiving collar and lamp-shade support, consisting, essentially, of a cylindrical portion having inwardly and downwardly extending tongues 10, an upper and lower bearing portion on each tongue, the said collar being formed with an annular and outwardly-projecting head, and a means of ventilation between the said tongues, and clamping-tongues 8 on said collar, all arranged, substantially as and for the purposes set forth.

704,712. MOLDING-MACHINE. WILLIAM M. DUNCAN, Alton, Ill., assignor of one-half to James Duncan, Alton, Ill. Filed July 3, 1901. Serial No. 66,945. (No model.)

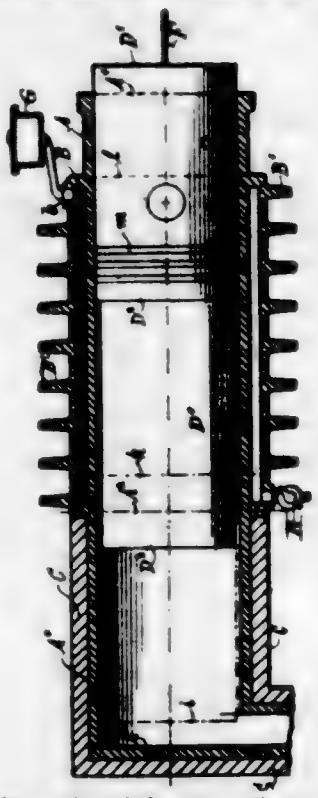


Claim.—1. In a molding-machine, the combination of a support, a counterbalanced shaft journaled in said support, a frame keyed at one side to said shaft, a hub having horizontally-extending arms, standards connecting the arms of the hub to the frame, a pattern-supporting plate carrying a pattern movable in the frame, and provided with perforations that receive the standards, a threaded rod extending from the frame, a sleeve held against movement by the hub, surrounding the threaded rod, a hand-wheel secured to the sleeve, a clamping-plate having a right-angled extension which is loosely pivoted to the counterbalanced shaft, and a bracket secured to the support at one side of the counterbalanced shaft and adapted to support the mold.

2. In a molding-machine the combination with a counterbalanced shaft, a frame keyed to said shaft, a locking projection on said frame and a pattern-supporting plate carrying a pattern adapted to fit in said frame, of a clamping-plate pivotally connected to said shaft, and a locking-handle pivoted to the outer end of the clamping-plate and provided with a slot which is adapted to engage the said projection on the frame; said clamping-plate being adapted to be reversed with the pattern and frame.

704,718. EXPLOSIVE-ENGINE. MATHIAS J. KLEIN, Baltimore, Md. Filed Jan. 17, 1901. Serial No. 43,650. (No model.)

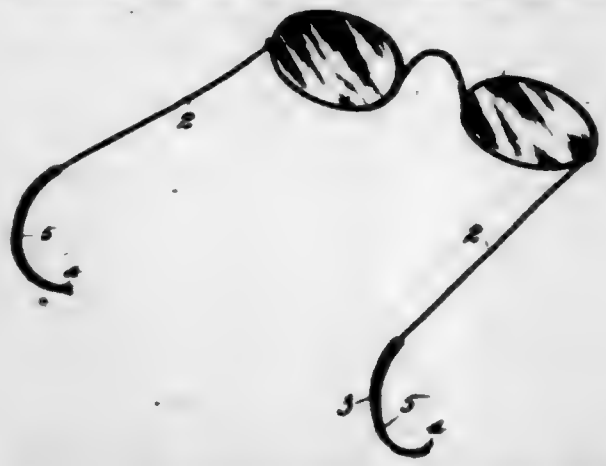
Claim.—1. In an explosive-engine of the four-cycle type, the combination, of a single-acting cylinder, having on the compression side of the same an insulated cylinder extension, and on the other side of the cylinder a water-jacket, the highest point of the latter having communication with the atmosphere as described, said water-jacket being surrounded by air-ribs for cooling the water in the jacket, of a piston, having a hollow piston extension slightly smaller in diameter than the piston, in length equal to the piston-stroke or longer, and extending into the cylinder extension, the hollow space of the piston extension being closed to the atmosphere, for the purpose and substantially as shown and described.



2. In an explosive-engine of the four-cycle type, the combination, of the single-acting cylinder A, having the cylinder extension A^6, the latter being surrounded by the removable insulation C, the other side of the cylinder having the water-jacket B, the latter, by means of opening *b*, being in communication with the atmosphere as described, and having the air-ribs B' for cooling the water in the jacket, of a piston D, having the hollow piston extension D^6, slightly smaller in diameter than piston D, its length D^3 D^5 being equal to the piston-stroke or longer and extending into the cylinder extension, the hollow space E of the piston extension being closed by the removable plate D^4, the whole constructed, to be operated and to work in the manner and for the purpose, substantially as described.

3. In an explosive-engine of the four-cycle type, the combination, of a single-acting cylinder, having on the compression side of the same a cylinder extension, and on the other side of the cylinder a water-jacket, the highest point of the latter having communication with the atmosphere as described, said water-jacket being surrounded by air-ribs for cooling the water in the jacket, of a piston, having a hollow piston extension slightly smaller in diameter than the piston, in length equal to the piston-stroke or longer, and extending into the cylinder extension, the hollow space of the piston extension being open to the atmosphere, for the purpose and substantially as shown and described.

704,714. ATTACHMENT FOR SPECTACLES. AUBIN A. LAPORTE, St. Louis, Mo. Filed Oct. 11, 1901. Serial No. 78,208. (No model.)



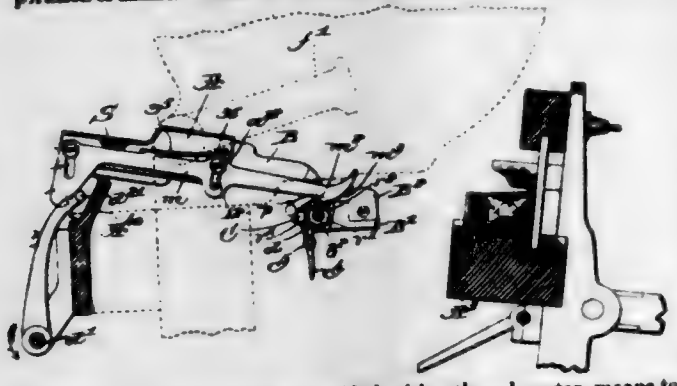
Claim.—1. The combination with a pair of spectacles having a temple provided with a hook, of an attachment comprising a flexible plate loosely threaded at both ends onto the hook of said temple and lying on the inside of the curve thereof, and free from engagement with said hook.

intermediate the ends of the plate, substantially as and for the purpose set forth.

2. The combination with a pair of spectacles having a temple provided with a hook, of an attachment comprising a channeled plate loosely threaded at both ends onto the hook of said temple and lying on the inside of the curve thereof, substantially as and for the purpose set forth.

3. The combination with a pair of spectacles having temples provided with hooks, of an attachment comprising a spring-strip threaded onto said temple-hooks at the insides thereof and so laterally connected to the hooks that lateral movement of the strips is provided with respect to said hooks, substantially as described.

704,715. THREAD-PARTER FOR LOOMS. EDWARD S. STIMPSON, Hopedale, Mass., assignor to Draper Company, Hopedale, Mass., a Corporation of Maine. Filed Jan. 16, 1902. Serial No. 90,014. (No model.)



Claim.—1. A loom-temple provided with a thread-parter, means to actuate it and means to operatively position it, a detent to normally engage the latter means and maintain the thread-parter inoperative, a device to release such means, and means governed by a plurality of successive operations of the thread-parter to effect reëngagement of the positioning means and the detent.

2. A loom-temple provided with a thread-parter, means to actuate it and means to operatively position it, a rotatable detent to normally engage the latter means and maintain said thread-parter inoperative, a device to rotate the detent and release such means, and means governed by a plurality of successive actuations of the thread-parter to effect movement of the detent into reëngagement with the positioning means.

3. A loom-temple provided with a thread-parter, means to actuate it and a spring to operatively position it, a detent to normally engage the spring and maintain the thread-parter inoperative, a device to disengage the spring from the detent, and means actuated by a plurality of successive operations of the thread-parter to restore the spring to the control of the detent.

4. A loom-temple provided with a thread-parter, means to project it into operative position and means to retract and operate it, a detent to normally engage the projecting means and maintain the thread-parter retracted and inoperative, a device to disengage said means and the detent, and means governed by a plurality of successive retractive movements of the thread-parter to restore the projecting means to the control of the detent.

5. A reciprocating temple provided with a relatively movable thread-parter, actuating means therefor to part the filling end in advance of the outward stroke of the temple, a detent to normally maintain the thread-parter inoperative, a device operated by or through the inward stroke of the temple to release the thread-parter from the control of the detent, and means governed by a plurality of successive operations of the thread-parter to restore the same to the control of the detent.

6. A reciprocating temple provided with a relatively movable thread-parter, a spring to move it into operative position, a detent to engage the spring and maintain the thread-parter retracted, means to actuate the latter, a device fixed relatively to the temple, to effect disengagement of the detent and spring on the inward stroke of the temple, and means actuated by a plurality of successive operations of the thread-parter to effect reëngagement of the spring and detent.

7. A loom-temple provided with a relatively movable thread-parter, means to operatively position it, and means to actuate it, a rotatable ratchet mounted on the temple and having a detent to engage and maintain the positioning means inoperative, an actuating-pawl for the ratchet, moved at each operation of the thread-parter to rotate the ratchet step by step, and a device to effect initial relative movement of the ratchet to release the positioning means from the control of the detent, whereby the thread-parter is permitted to be moved into operative position, successive operations of the thread-parter thereafter by its actuating means effecting the rotation of the ratchet to again bring the detent into operative engagement with the positioning means to retain the thread-parter inoperative.

8. A loom-temple provided with a relatively movable thread-parter, a spring to operatively position it, a rotatable ratchet on the temple, an actuating-pawl therefor movable with the thread-parter, means governed by the ratchet to engage the spring and retain the thread-parter inoperative, means to actuate the latter when operatively positioned, a predetermined number of successive operations rotating the ratchet to effect engagement of the spring and the retaining means, to hold the thread-parter inoperative, and a device to engage and rotate the ratchet from normal position, to thereby release the spring and permit it to operatively position the thread-parter.

9. In a loom provided with filling-replenishing mechanism, a controller therefor, a thread-parter, a spring to operatively position it, means to normally engage the spring and maintain the thread-parter inoperative, a device rendered operative by or through the action of the controller, to disengage the spring and said means, and means to effect reëngagement of the spring, with the thread-parter inoperative, after a predetermined number of successive operations of the latter.

10. In a loom provided with filling-replenishing mechanism, a controller therefor, the lay, a thread-parter having a heel adapted when operatively positioned to be engaged by the lay, to operate the parter, means to operatively position the thread-parter, a detent to engage said means and normally maintain the parter inoperative, a device rendered operative by the controller upon filling replenishment to effect movement of the detent to release the positioning means, and means to restore the latter to the control of the detent after a predetermined number of operations of the thread-parter by the lay.

11. In a loom provided with filling-replenishing mechanism, a controller therefor, a reciprocating temple, its fixed stand, a thread-parter movable on the temple, to be engaged and actuated by a moving part of the loom, means to operatively position the thread-parter, a detent mounted on the temple to normally engage said means and retain the parter inoperative, a releasing device carried by the temple-stand and rendered operative by the controller upon filling replenishment, to effect disengagement of the positioning means and the detent by or through the inward stroke of the temple, and means to restore the positioning means to the control of the detent by or through a predetermined number of operations of the thread-parter.

12. In a loom provided with filling-replenishing mechanism, a reciprocating temple provided with a relatively movable thread-parter, a spring to move it into operative position, a temple-stand, a ratchet rotatably mounted on the temple and having an attached detent to engage the spring and lock the parter in inoperative position, an actuating-pawl for the ratchet, to rotate the same step by step when the thread-parter is operated, a predetermined number of successive operations by a moving part of the loom causing engagement of the spring by the detent, a lug on the ratchet, and a normally inoperative hooked arm on the temple-stand, rendered operative upon filling replenishment to engage the lug on the outward stroke of the temple, the return stroke of the latter causing rotation of the ratchet, through engagement of the arm and lug, to release the spring from the control of the detent.

13. In a loom provided with automatic filling-replenishing mechanism, a reciprocating temple provided with a slidably-mounted thread-parter having a heel adapted to be engaged and actuated by a moving part of the loom, a spring to operatively position the thread-parter, a detent movably mounted on the temple and normally engaging the spring, to retain the parter inoperative, means operated conjointly by the reciprocation of the temple and filling replenishment, to move the detent out of engagement with and release the spring, and means actuated by a plurality of successive operations of the thread-parter, to move the detent into reëngagement with the spring and retain the parter inoperative.

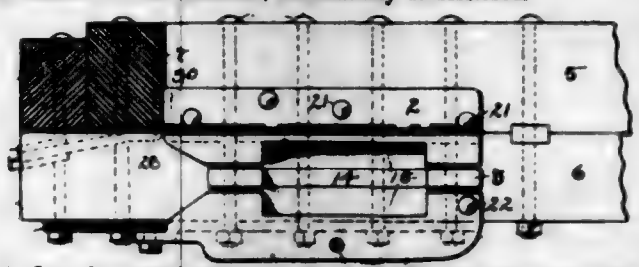
14. In a loom provided with automatic filling-replenishing mechanism, a reciprocating temple provided with a slidably-mounted spring-controlled thread-parter adapted, when operatively positioned, to be actuated by a moving part of the loom, a detent rotatably mounted on the temple and normally locking the parter from operation, a ratchet rotatable with the detent, an actuating-pawl operated by a plurality of successive operations of the parter to rotate the ratchet and effect the locking of the thread-parter by the detent, and means operated conjointly by filling replenishment and the reciprocation of the temple, to move the detent and unlock the thread-parter.

704,716. DRAFT-RIGGING FOR CARS. WILLIAM G. SWAN, Detroit, Mich. Filed Dec. 12, 1901. Serial No. 85,646. (No model.)

Claim.—1. A draft-rigging comprising the draw-bar and followers, in combination with a pair of draft-sills having separate independent follower confining and supporting members mounted opposite each other upon said sills, and a pair of draft-arms secured to the bottom of said sills having further separate and independent follower confining and supporting members secured oppositely thereto, substantially as described.

2. The draft-sill and draft-arm, in combination with an upper draw-

bar-follower-engaging member having lateral flanges adapted to rest between said sill and arm, a lower follower-engaging member bolted to said draft-arm, and an intermediate follower-engaged member embedded within and secured to said draft-arm, substantially as described.



3. In a draft-rigging for cars, the draft-sills and draft-arms secured thereto, a draw-bar and followers and a support therefor comprising upper members having lateral flanges adapted to rest between each sill and arm, lower members mounted on said draft-arms, and a separate intermediate member embedded within each draft-arm, all of said members having follower and engaging and confining portions, substantially as described.

4. The draft-sills having draft-arms secured at their ends and bottom, an end sill connecting said sills and arms, a draft-rigging frame mounted on said draft sills and arms, and a tie-bolt mounted at the end of said draft-arms and having a vertical portion adapted to engage between the end sill and the end of the draft-sill, substantially as described.

5. The draft-sill, and the upper follower-engaging member mounted thereon having a vertical rib at its front end to engage the end of said sill, in combination with a separate lower follower-supporting member mounted beneath said sill and upper member, and a single cross-bolt 22 to pivotally support said lower member in relation to said upper member, substantially as described.

704,717. ARTIFICIAL FUEL AND METHOD OF PREPARING SAME. BERTRAND M. THOMAS, San Francisco, Cal. Filed Nov. 20, 1901. Serial No. 83,035. (No specimens.)

Claim.—1. An artificial fuel composed of tule peat and crude petroleum mixed with an alkali earth, substantially as set forth.

2. The method of preparing artificial fuel from tule peat which consists in first drying the peat, then saturating it with crude petroleum, then mixing it with alkali earth, and afterward pressing it into forms, substantially as set forth.

704,718. BALING-PRESS. LUTHER TRABUE, Girard, Ill., assignor to the Ohio Hay Press Company, Bellevue, Ohio, a Corporation. Filed Apr. 7, 1902. Serial No. 101,851. (No model.)

Claim.—1. In a baling-press, the combination of a plunger, a sectional pitman, an arm having a fixed pivot and which is connected to the pitman by means of links, a pivoted lever extending between said links and a cross-head adapted to engage said lever and said arm, substantially as set forth.

2. In a baling-press, the combination of a plunger, a sectional pitman, an arm having a fixed pivot and connected to said pitman by means of links, a pivoted lever extending between said links and having a shoulder adapted to engage a friction-roller on said pitman, and a cross-head adapted to engage said lever and said arm, substantially as set forth.

3. In a baling-press, the combination of a plunger, a sectional pitman, a pivoted arm, links connecting said arm to said pitman, a lever extending between said links and a cross-head having projections adapted to engage a projection on said arm and having cam-shoulders adapted to engage a projection on said lever, substantially as set forth.

4. In a baling-press, the combination of a plunger, a jointed pitman, a pivoted arm having a link connection with said pitman and which said arm has a slot-and-bolt connection, a pivoted lever fitting between said links, and a cross-head adapted to engage said lever and said arm, substantially as set forth.

5. In a baling-press, the combination of a plunger, a jointed pitman, a reach having strips to guide said pitman and a pivoted arm, a link connection between said arm and pitman, a pivoted lever and a cross-head having projections for engaging said arm and having cam-shoulders for engaging said lever, substantially as set forth.

6. In a baling-press, the combination of a plunger, a jointed pitman, a pivoted arm connected to said pitman, a pivoted lever engaging the connection between said arm and pitman, and a cross-head adapted to engage said lever and arm, substantially as and for the purpose set forth.

704,719. RAKE. CHARLES H. TRUMPLER, Brooklyn, N. Y. Filed Oct. 15, 1901. Serial No. 78,679. (No model.)

Claim.—1. A rake comprising a bar having depending teeth; and diverging sets of teeth removably secured to said bar.

2. A rake comprising a bar, having a set of depending rigid teeth; a set of laterally-diverging rigid teeth; and means for securing said diverging teeth in position.

3. A rake having depending and diverging teeth, one set thereof detachable; and means for attaching the detachable part of said teeth.

4. In an attachment for a rake, a set of divergent teeth, having means whereby they may be attached to an end of the tooth-bar of a hand-rake.

5. A hand-rake, comprising a single set of separated rigid teeth whose points lie in a long row; at one end of said set a small set of separated rigid teeth whose points lie in a short row which extends crosswise of said long row; so that the long row may be employed in ordinary use, and so that the short row may be brought into action by tilting the rake.

6. A hand-rake comprising a single set of separated rigid teeth, whose points lie in a long row; and at each end of said set a small set of separated rigid teeth, the points of each of said small sets lying in short rows which extend crosswise of said long row, so that the long row may be employed in ordinary use, and so that either of said short rows may be brought into action by tilting the rake one way or the other.

7. A hand-rake comprising a single set of separated teeth whose points lie in a long row; at one end of said set a small set of separated teeth whose points lie in a short row which extends crosswise of said long row; so that the long row may be employed in ordinary use, and so that the short row may be brought into action by tilting the rake; all of said teeth lying substantially in the same plane, thereby forming a substantially continuous set of teeth, and the teeth in the short row diverging from one another and from the teeth lying in the long row.

8. A hand-rake comprising a single set of separated teeth, whose points lie in a long row; and at each end of said set a small set of separated teeth; the points of each of said small sets lying in short rows which extend crosswise of said long row, so that the long row may be employed in ordinary use, and so that either of said short rows may be brought into action by tilting the rake one way or the other, all of said teeth lying in substantially the same plane, thereby forming a substantially continuous set of teeth, and the teeth of each of the short rows diverging from one another and from the teeth in the long row.

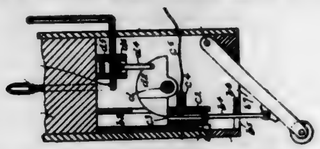
9. A hand-rake comprising, in combination, a bar, and a plurality of teeth extending therefrom at various angles; and said teeth terminating in a row which extends substantially at right angles to the several teeth.

10. A hand-rake comprising, in combination, a handle; a bar sub-

stantially at right angles thereto; a row of substantially parallel teeth depending from said bar and having an angular relation to said handle; and diverging teeth at one end of said row and lying in substantially the same plane as said row; said diverging teeth terminating at successively higher points than the teeth in said row.

11. A hand-rake comprising, in combination, a handle; a bar substantially at right angles thereto; a row of substantially parallel rigid teeth depending from said bar and having an angular relation to said handle; and a plurality of rigid teeth extending from an end of said bar at various angles with said bar and terminating at successively higher points than the teeth in said row.

704,720. RAILWAY-SIGNAL. WILLIS C. VAN DERLIP, Sr., Corning, N. Y. Filed Apr. 15, 1902. Serial No. 102,974. (No model.)

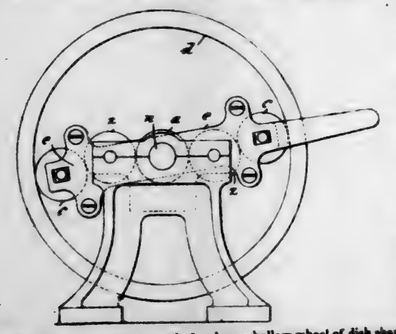


Claim.—1. A signal apparatus for railways comprising a casing secured to the engine and provided with a vertically-arranged piston-cylinder which opens downwardly, a piston mounted in said cylinder, a lever pivoted in the bottom of said casing and in operative connection with said piston, a steam-pipe passing through said casing and in connection with the boiler and devices for opening and closing said pipe, said devices being adapted to be operated by said piston, substantially as shown and described.

2. A signal apparatus for railways comprising a casing secured to the engine and provided with a vertically-arranged piston-cylinder which opens downwardly, a piston mounted in said cylinder, a lever pivoted in the bottom of said casing and in operative connection with said piston, a steam-pipe passing through said casing and in connection with the boiler and devices for opening and closing said pipe, said devices being adapted to be operated by said piston, and means adjacent to the track for operating said lever, substantially as shown and described.

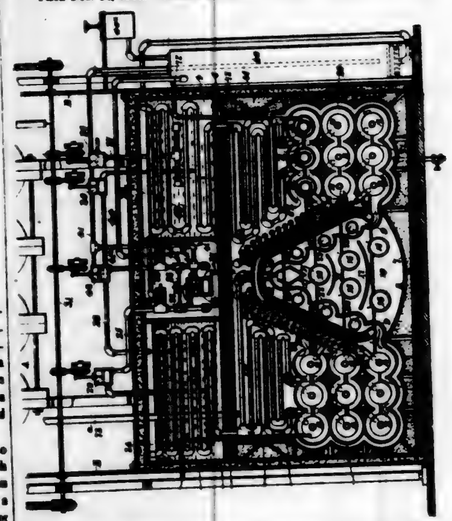
3. A signal apparatus for railways comprising a casing secured to the engine and provided with a vertically-arranged piston-cylinder which opens downwardly, a piston mounted in said cylinder, a lever pivoted in the bottom of said casing and in operative connection with said piston, a steam-pipe passing through said casing and in connection with the boiler and devices for opening and closing said pipe, said devices being adapted to be operated by said piston, and means adjacent to the track for operating said lever, consisting of a box or casing, a lever pivoted therein, two pulleys mounted in said box or casing and geared in connection and one of which is in operative connection with said lever and adapted to raise it above said box or casing; and means for operating the other pulley, substantially as shown and described.

704,721. FRICTION-WHEEL GEARING. GUSTAV VOIGT, Berlin, Germany. Filed Dec. 13, 1901. Serial No. 85,907. (No model.)



Claim.—In combination, a shaft, a larger hollow wheel of dish shape mounted on the end thereof, a second shaft axially in line therewith, a smaller wheel carried by said second shaft within the larger wheel, a pair of smaller wheels journaled in stationary bearings and having their peripheries in contact with said smaller wheel, and a reversing-frame and a pair of small rollers journaled thereon having their peripheries in contact with the inner circumference of the large wheel and designed to contact with said pair of smaller wheels, substantially as described.

704,722. STEAM-GENERATOR. JAMES C. WALKER, Waco, Tex. Filed Feb. 14, 1901. Serial No. 47,321. (No model.)



Claim.—1. In a generator of the instantaneous type, the combination with a generating-chamber and heating means therefor, of a source of water-supply removed from said chamber and in communication therewith, controlling means intermediate of the chamber and said source of supply and operated by the pressure of steam within the steam-space of the generator to effect the automatic control of the water-supply.

2. In a generator of the instantaneous type, the combination with a generating-chamber, heating means and a source of water-supply in communication with the chamber, of a controlling device disposed to control the flow of water from the source of supply to the generating-chamber, a regulating device operated by the steam-pressure within the steam-space of the generator and operatively related to the controlling means, whereby the steam-pressure within the generator is automatically regulated.

3. In a generator of the instantaneous type, the combination with a generating-chamber, heating means therefor and a source of water-supply in communication therewith, of a water-supply pipe leading from the source of supply to the generating-chamber, a regulating device controlled by the steam-pressure within the steam-space of the generator for regulating flow of water through said supply-pipe, and means for automatically returning the water from the supply-pipe to the source of supply when the regulator is operated to reduce or discontinue the supply of water to the generating-chamber.

4. In a generator of the instantaneous type, the combination with a generating-chamber, heating means therefor and a source of water-supply, of a supply-pipe leading from the source of supply to the chamber, a controlling-valve and a relief-valve in said pipe, a regulator operated by the steam-pressure within the steam-space of the generator to close the controlling-valve, and means for pumping water through the supply-pipe to the generating-chamber.

5. In a generator of the instantaneous type, the combination with a generating-chamber, heating means therefor and a water-tank removed from the generating-chamber, of means for heating the water in said tank, and means for leading the heated water from the tank and for delivering it in the form of saturated steam to the generating-chamber.

6. In a generator of the instantaneous type, the combination with a generating-chamber and burners therefor, of a water-supply tank removed from the generating-chamber, means for leading products of combustion from said burners through the water-supply tank to heat the water therein, and means for leading the water from said supply-tank to the generating-chamber.

7. In a generator of the instantaneous type, the combination with a generating-chamber, flashing-tubes therein and a heater disposed to heat the walls against which the saturated steam is projected from the flashing-tubes, of a source of supply removed from the generating-chamber and in

communication with the flashing-tubes, and means controlled by the steam-pressure within the generator for automatically regulating the supply of fluid to the flashing-tubes.

8. In a generator of the instantaneous type, the combination with a generating-chamber, flashing-tubes therein and heating means, of a water-supply tank removed from the generating-chamber and in communication with the flashing-tubes, means for heating the water in said tank, and a regulating device intermediate of the tank and tubes, said device being operated by the pressure of steam within the generator to control the supply of fluid to the tubes.

9. In a generator of the instantaneous type, the combination with a generating-chamber, flashing-tubes therein and burners disposed to heat the wall of said chamber against which the saturated steam is projected, a water-supply tank removed from the generator, a heating device arranged within the tank, means for leading the products of combustion from the generator-burners to said heater, a supply-pipe leading from the tank to the flashing-tubes, a controlling-valve in said pipe, and a regulating device disposed to operate said valve and operated by the steam-pressure within the generator.

10. In a generator of the instantaneous type, the combination with a generating-chamber, a burner disposed to heat the walls thereof, means for supplying water to the generating-chamber, means for supplying fuel to the burner, and means for automatically controlling the supply of both water and fuel.

11. In a generator of the instantaneous type, the combination with a generating-chamber, a burner, means for supplying water to the generating-chamber and means for supplying fuel to the burner, of means operated by the steam-pressure within the generator for controlling both the water and the fuel supply.

12. In a generator of the instantaneous type, the combination with a generating-chamber, a burner therefor, a source of water-supply in communication with the generating-chamber, a source of fuel-supply in communication with the burner, a controlling-valve intermediate of the generating-chamber and source of water-supply, a controlling-valve intermediate of the fuel-supply and burner, and a regulating device common to both of the controlling-valves and designed to be operated by excessive pressure of steam within the generator.

13. In a generator of the instantaneous type, the combination with a generating-chamber and burner therefor, of a source of water-supply, a source of fuel-supply, a water-pipe leading from the source of water-supply to the generator, a fuel-supply pipe leading from the source of fuel-supply to the burner, automatically-operated controlling-valves located in said pipes, means for forcing the water and fuel through said pipes, and automatically-operated relief devices disposed to effect the return of the water or fuel from the supply-pipes to the sources of supply when the controlling-valves are closed.

14. In a generator of the instantaneous type, the combination with a generating-chamber and burner, of flashing-tubes within the generating-chamber, a water-supply tank in communication with the flashing-tubes, a source of fuel-supply in communication with the burner, means for automatically regulating the supply of water and fuel to the tubes and burner, respectively, and means for heating the water within the supply-tank.

15. In a generator of the instantaneous type, the combination with a generating-chamber and burner, of means for supplying fuel to the burner, and a regulating device controlling the supply of fuel to the burner and operated by the pressure of steam within the generator.

16. In a generator of the instantaneous type, the combination with a generating-chamber and heating means therefor, of a source of water-supply in communication with the generating-chamber, a superheating-chamber in communication with the generating-chamber, and means for heating the superheating-chamber.

17. In a generator of the instantaneous type, the combination with a generating-chamber, heating means therefor and a source of water-supply in communication with the generating-chamber, of a superheating-chamber in communication with the generating-chamber and disposed to receive the steam therefrom, of a plurality of heating devices within the superheating-chamber, and means for leading the steam around said heating devices prior to its delivery to the motor.

18. In a generator of the instantaneous type, the combination with a generating-chamber, burners therefor and flashing-tubes within said chamber, of a source of water-supply in communication with said tubes, a superheating and drying chamber removed from but in communication with the generating-chamber, and separate means for heating the superheating-chamber.

19. In a generator of the instantaneous type, the combination with a generating-chamber, a series of burners disposed to heat the walls thereof, a series of flashing-tubes within the chamber, and a source of water-supply in communication with said tubes, of a circuitous superheating-chamber removed from but in communication with the generating-chamber, separate burners located within the superheating-chamber, and means for supplying fuel to the burners of the generator and superheater respectively.

20. In a generator of the instantaneous type, the combination with a generating-chamber and burners therefor, of a superheating-chamber, a plurality of burners therein, said superheating-chamber being in communication with the generating-chamber but removed therefrom, a water-supply tank in communication with the generating-chamber, and means for leading the products of combustion from both the generator and superheater burners through said tank.

21. In a generator of the instantaneous type, the combination with a generating-chamber and burners, of a superheating-chamber in communication with the generating-chamber, separate burners for the superheating-chamber, means for supplying water to the generating-chamber, means common to all of the burners for supplying fuel thereto, and means for automatically regulating the supply of water and fuel.

22. In a generator of the instantaneous type, the combination with a generating-chamber and heating means, of a plurality of water-heating chambers removed from the generating-chamber, means for heating said chambers, means for leading water to said chambers successively, and means for leading water from one of said chambers to the generating-chamber.

23. In a generator of the instantaneous type, the combination with a generating-chamber and heating means, of an initial water-heating chamber, a low-pressure chamber, means for heating said chambers in different degrees, means for leading water to said chambers successively, and means for leading water from the low-pressure chamber to the generating-chamber.

24. The combination with a generating-chamber, of an initial water-heating chamber, a low-pressure chamber, means for heating said chambers, means for leading water through said chambers successively and from the low-pressure chamber to the generating-chamber, automatically-operated controlling means for regulating the communication between the low-pressure chamber and generating-chamber, and means for directing the flow of water from the low-pressure back to the initial water-heating chamber.

25. In a generator of the instantaneous type, the combination with a generating-chamber, heating means therefor, a pair of superheating-chambers removed from but in communication with the generating-chamber, burners located within each of said superheating-chambers, a pair of water-heating chambers, means for leading water through said chambers successively and from one of said chambers to the generating-chamber, and heating devices for each of the water-heating chambers, said devices being provided with a heating agent by the burners of the superheating-chambers.

26. In a generator of the instantaneous type, the combination with a generating-chamber and heating means therefor, of a pair of superheating-chambers removed from but in communication with the generating-chamber, burners within each of the superheating-chambers, an initial water-heating chamber and low-pressure chamber in communication with the initial water-heating chamber, heaters within the initial water-heating chamber and low-pressure chamber, respectively, means for supplying a heating agent to said heaters from the burners of the superheating-chambers, and means for supplying the heater within the low-pressure chamber with the products of combustion from the heating devices of the generator.

27. In a generator of the instantaneous type, the combination with a generating-chamber, burners therefor and a jacket surrounding said chamber, of means for effecting the escape of the products of combustion from the burners through said jacket.

28. In a generator of the instantaneous type, the combination with a generating-chamber having its outer wall defined by a jacket, a partition within said jacket, ingress and egress openings in the wall of said jacket at opposite sides of the partition, and burners disposed to heat the inner walls of the generating-chamber and to supply heated products of combustion for circulation within the jacket and around the partition thereof.

29. In a generator of the instantaneous type, the combination with a generating-chamber having its outer wall defined by a jacket, flashing-tubes located within the generating-chamber, a source of water-supply in communication with said tubes, and burners disposed to heat the inner walls of the generating-chamber and to effect the circulation of the products of combustion within the jacket.

30. In a generator of the instantaneous type, the combination with a generating-chamber, burners therefor, superheating-chambers in communication with the generating-chamber, burners for the superheating-chambers, and heating-coils seated upon the generating-chamber and disposed to receive the products of combustion from the burners of the superheating-chambers.

31. In a generator of the instantaneous type, the combination with a generating-chamber provided with a hollow jacket and burners disposed

to heat the inner walls of the generating-chamber and to supply products of combustion for circulation through the jacket, superheating-chambers removed from or in communication with the generating-chamber, burners located within said superheating-chambers, heating-coils nested upon the jacket of the generating-chamber and disposed to receive products of combustion from certain of the burners of the superheating-chambers, heating-coils located within the steam-space of the generator and in communication with certain of the superheater-burners, a plurality of water-heating chambers, means for supplying a heating agent thereto from the heating-coils, means for leading water through said heating-chambers successively, and means for supplying water from one of said chambers to the generating-chamber.

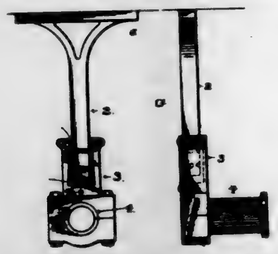
32. In a generator of the instantaneous type, the combination with a generating-chamber and heating means, of a pair of water-heating chambers, means for pumping water or steam into one of said chambers, means for pumping water from one chamber into the other, a supply-pipe communicating with the last-named chamber and with the generator, means for pumping water through said pipe, a valve-controlled relief-pipe leading from the water-supply pipe back to the first chamber, a source of fuel-supply, a fuel-supply pipe leading therefrom to the burners, means for pumping the fuel through said supply-pipe, and a valve-controlled relief-pipe leading from the fuel-supply pipe back to the source of fuel-supply, whereby the several pumping means may be operated continuously without interfering with the automatic operation of the generator.

33. In a generator of the instantaneous type, the combination with a generating-chamber and burners, of a water-supply tank, means for leading water from said tank to the generating-chamber, a casing surmounting the generator, a motor mounted within the casing and exhausting therein, and means for leading the exhaust-steam or water of condensation from the interior of said casing to the water-supply tank.

34. In a generator of the instantaneous type, the combination with a generating-chamber and heating means, of a superheater communicating with the generating-chamber, a series of burner-casings disposed within the superheater, a burner within each of said burner-casings, and means for compelling the steam as it passes through the superheater to circulate around each of the burner-casings.

35. In a generator of the instantaneous type, the combination with the generating-chamber provided with a hollow jacket, and burners disposed to heat the inner walls of the generating-chamber and to supply products of combustion for circulation through the jacket, superheating-chambers removed from, but in combination with, the generating-chamber, burners located within the superheating-chambers, heating-coils nested upon the jacket of the generating-chamber and disposed to receive products of combustion from certain of the burners of the superheating-chambers, heating-coils located within the steam-space of the generator and in communication with certain of the superheating-burners, a plurality of water-heating chambers disposed to be heated by extensions of the heating-coils, and by a heating agent supplied to one of the water-chambers from the hollow jacket of the generating-chamber, means for leading water through the water-heating chambers successively and from one of the heating-chambers to the generating-chamber, flashing-tubes within the generating-chamber for effecting the instantaneous generation of steam, and means for regulating the supply of water to the generating-chamber, said regulating means being controlled by the pressure of steam within the steam-space of the generator.

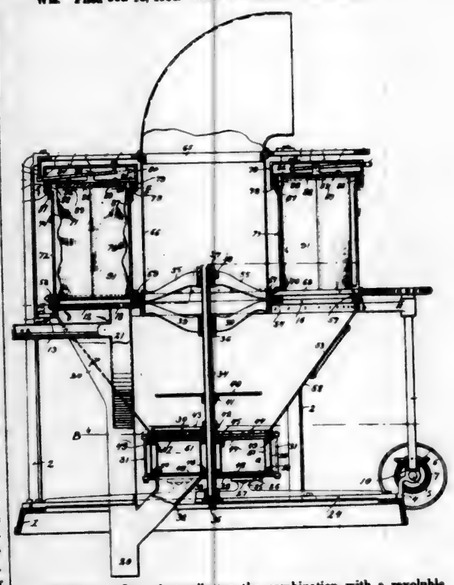
704,723. BELT-CARRIER. JOHN WEIGHART, San Francisco, Cal. Filed Apr. 4, 1901. Serial No. 54,241. (No model.)



Claim.—1. A belt-carrier for a driving-pulley comprising a hanger composed of a fixed member having a top flange, a separable member having a box with an open top end to receive the end of the fixed member, in which said member is secured after adjustment by pouring molten metal into the box around the end of the fixed member, a two-part sleeve on the separable member divided longitudinally, means for securing the movable part of the sleeve to the box, and a belt-carrying pulley loosely mounted on the sleeve.

2. In a pulley-hanger the combination, of a fixed member having a top flange and provided with recesses in the surface at the lower end, a separable member having an open-end box, the opening in which is adapted to permit lateral as well as vertical adjustment of the end of the fixed member before it is secured thereon, said parts being united after adjustment by pouring molten metal into the space around the lower end of the fixed member and allowing it to set.

704,724. DUST-COLLECTOR. LEMUEL B. WHITNEY, Milwaukee, Wis. Filed Oct. 16, 1901. Serial No. 78,771. (No model.)



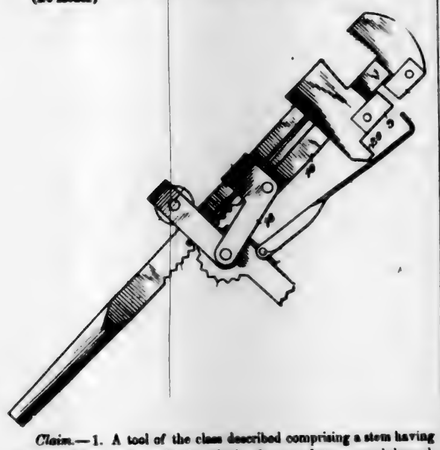
Claim.—1. In a dust-collector, the combination with a revoluble support, of a series of yielding screens supported thereby, and having pivotally-attached levers at their upper ends, and a suitable frame provided with a ring formed with a downward-depending flange having oblique-walled notches in its under side, in engagement with said levers, for depressing and collapsing said screens as they reach given points, and for restoring them to their normal positions after passing such points.

2. In a dust-collector, the combination with a suitable frame, of a revoluble plate supported thereby, and formed with an annular series of openings; an annular series of outer and inner supports rising from said plate, having offset slotted upper continuations; spring-actuated cross-bars movable in said slots; a flange having oblique-walled notches in its under side secured to said frame; levers pivotally attached to said movable cross-bars for engagement with said notched flange; and yielding bag-screens secured to said movable cross-bars, and to the revolving plate at the lines of the openings therein.

3. In a dust-collector, the combination with a suitable frame, of a revoluble plate supported thereby, and formed with a series of openings; a series of dust-collecting screens carried by said revoluble plate and communicating with said openings; a stationary drum or casing below said revolving plate having openings in its upper and lower plates; a vertical revoluble spindle extending through said drum or casing and secured to said revolving plate; a revoluble drum secured to said spindle within said stationary drum or casing, and formed with an annular series of open-ended buckets; an air-tight wall forming a closed chamber around the vertical spindle, between the revoluble plate and the stationary drum or casing; a brush secured to said spindle and in sweeping engagement with the upper plate of the stationary drum or casing; and a dust-discharge pipe leading from the opening in the lower plate of said drum or casing.

4. In a dust-collector, the combination with a suitable frame, of an annular stationary plate supported thereby said plate having a solid portion with a dust-discharge opening and a series of small openings therethrough, and the balance of said plate having a series of large air-inlet openings therethrough; a dust-discharge pipe leading from the dust-discharge opening in the solid portion of said plate, and a closed chamber beneath the small openings therein, adjacent to the dust-discharge pipe and having a swing-valve communication therewith; a suction-pipe leading from said closed chamber; an upper annular plate resting and revoluble on said stationary plate, and formed with an annular series of openings; an annular series of yielding bag-screens, supported on said annular revoluble plate and communicating with the openings therein; a closed chamber beneath the air-inlet openings in said stationary plate; an inlet for dust-laden air leading to said last-named closed chamber; and means for depressing and collapsing said screens as they reach given points, and for restoring them to their normal positions after passing such points.

704,725. COMBINED WRENCH AND TIRE-SETTER. MADISON WHITMIRE, Carrier, Okla. Filed Apr. 21, 1902. Serial No. 103,966. (No model.)



Claim.—1. A tool of the class described comprising a stem having a perforated head and a rack below the head, a second stem passed through the perforation and having a head for coöperation with the head of the first stem, a strap attached to the second stem and passed around the first stem and provided with spaced arms, a lever pivoted between the spaced arms and having a segmental gear movable into and out of engagement with the rack when the lever is rocked, a second strap connected to the arms at opposite sides of the segmental gear and passed around the first stem, and a bearing-roller mounted between the sides of the second strap and adapted for contact with the opposite face of the first stem from the lever.

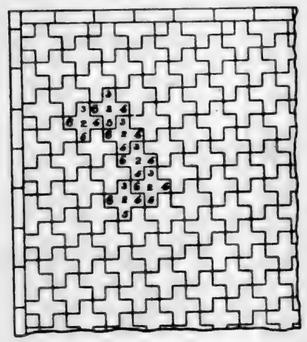
2. A tool comprising a stem having a perforated head and a rack below the head a second stem passed through the perforation of the head, a lever pivotally connected with the second stem and having a gear engaged with the rack to reciprocate the second stem when the lever is rocked, a stop upon the second stem for contact with the head of the first stem to limit the movement of the lever in one direction, a lug upon the head of the first stem, and a plate pivoted to the lever and having a terminal jaw, said plate being adapted to lie with its jaw beyond the lug for movement of the jaw toward and away from the lug when the lever is rocked.

704,726. SPINDLE ATTACHMENT FOR LATHES OR OTHER TOOLS. ANDREW C. WITZEL, New York, N. Y. Filed Feb. 24, 1902. Serial No. 96,163. (No model.)

Claim.—1. An attachment for a revolving spindle provided with a screw-thread, said attachment consisting of a central longitudinal core-piece, a sleeve movable longitudinally thereon and levers connected with said core-piece and operated by said sleeve and provided with segmental nuts adapted to engage the thread of said spindle, substantially as shown and described.

2. An attachment for a rotatable spindle provided with a screw-thread at its outer end, comprising a central core-piece through which the spindle passes and provided with longitudinal grooves in the opposite sides thereof, pawl-levers pivoted in said grooves and provided at their outer ends with segmental nuts adapted to engage the thread of the spindle and a sleeve mounted on said core-piece and longitudinally movable thereon and adapted to engage said levers, substantially as shown and described.

704,727. TILE. CHARLES WORTH, Newark, N. J. Filed Apr. 3, 1902. Serial No. 101,173. (No model.)



Claim.—1. A tile, comprising, a central and main body portion, and a set of members radiating in different directions from said main body, the surface area of each individual radiating member being equal to the surface area of said main body portion, the tile being of an approximately cross-shaped configuration, providing open spaces between each pair of adjacent radiating members, for the reception of a radiating member of another tile when laid in the cement of a flooring, substantially as and for the purpose set forth.

2. A tile, comprising, a central and main body portion, and a set of members radiating in different directions from said main body, the tile being of an approximately cross-shaped configuration, providing open spaces between each pair of adjacent radiating members, for the reception of a radiating member of another tile when laid in the cement of a flooring, each radiating member being provided in its rear surface with a cement-receiving depression or recess, substantially as and for the purpose set forth.

3. A tile, comprising, a central and main body portion and a set of members radiating in different directions from said main body, the tile being of an approximately cross-shaped configuration, providing open spaces between each pair of adjacent radiating members, for the reception of a radiating member of another tile when laid in the cement of a flooring, each radiating member being provided in its rear surface with a cement-receiving depression or recess, and the surface area of each individual radiating member being equal to the surface area of said main body portion, substantially as and for the purpose set forth.

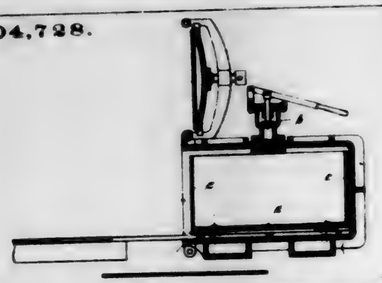
4. A tile, comprising, a central and main body portion, and a set of members radiating in different directions from said main body, a reinforcing rib or projection connecting the rear of the said main body with the said radiating members, and each radiating member being provided in its rear with a cement-receiving depression or recess, substantially as and for the purpose set forth.

5. A tile, comprising, a central and main body portion, and a set of members radiating in different directions from said main body, a reinforcing rib or projection connecting the rear of the said main body with the said radiating members, and each radiating member being provided in its rear with a cement-receiving depression or recess, and the surface area of each individual radiating member being equal to the surface area of said main body portion, substantially as and for the purpose set forth.

704,728. PROCESS OF PACKING POWDERY SUBSTANCES. ADOLPH WULFER, Charlottenburg, Germany. Filed Nov. 13, 1900. Serial No. 36,201. (No specimens.)

Claim.—A process for packing powdery substances, consisting in rarefying the air held among the particles of the substances and then exposing the same to the atmospheric pressure, substantially as described and for the purpose set forth.

704,728.



704,729. DEVICE FOR RETARDING THE SPEED OF VESSELS. AARON ROSEN, Philadelphia, Pa. Filed Nov. 21, 1901. Serial No. 83,122. (No model.)

Claim.—1. In a device of the character described, two shafts upon each side of the boat extending longitudinally of the boat and protruding from the rear thereof, two plates secured to the outer end of the shafts, said plates normally lying against the rear portion of the boat so as to present no resistance to the water, means located in the interior of the vessel for rotating the shafts so as to turn the plates outward beyond the sides of the vessel, substantially as and for the purpose specified.

2. In a device of the character described, two shafts extending from the interior of the vessel through the rear portion thereof, plates secured to the outer end of said shafts, said plates so formed as to normally lie against the rear portion of the vessel so as to present no resistance to the water, a gear-wheel secured upon the inner end of each of the shafts in the interior of the vessel, said gear-wheels being in mesh with one another, a beveled wheel secured to one of the gear-wheels, a second beveled wheel in mesh with the other, the upright shaft to which the latter beveled wheel is secured, substantially as and for the purpose set forth.

704,730. HITCHING-WEIGHT. ANTON ZEERLEYE, Grand Rapids, Mich. Filed July 26, 1901. Serial No. 69,814. (No model.)

Claim.—1. A device of the character specified, comprising a metallic body provided with means for connection with a hitching-strap, and a buffer and sound-deadener associated with and projecting beyond the lower portion of the body.

2. A device of the character specified, comprising a metallic body provided with means for connection with a hitching-strap, and a combined buffer and sound-deadener associated with the body and projecting beyond the bottom portion thereof.

3. A device of the character specified, comprising a metallic body, and a buffer and sound-deadener associated with the lower portion thereof and composed of soft metal.

4. A device of the character specified, comprising a metallic body provided with means for connection with a hitching-strap, and having its lower portion provided with a marginal recess, in combination with a buffer and sound-deadener held associated with the body by the said recess.

704,781. COIN-HOLDER. ALBERT ATTERBURY, Brooklyn, N. Y., assignor to Robert Henry McClelland and Leo Evans Sawrie, Nashville, Tenn. Filed Oct. 5, 1901. Serial No. 77,738. (No model.)

Claim.—1. A coin-holder comprising a two-part telescopic casing, means for holding the two portions of the casing in spread position, and means operable by the compression of the casing for ejecting a coin therefrom.

2. A coin-holder comprising a two-part telescopic casing, means for holding the two parts of the casing in spread position, a coin-ejector, and means operable by the compression of the casing for reciprocating said ejector.

3. A coin-holder comprising a two-part telescopic casing having a normally closed coin-discharging orifice, means for holding the two portions of the casing in extended or spread position, and means operable by the compression of the casing for effecting the opening of the discharge-orifice and the forcing of a coin therethrough.

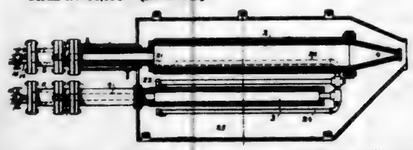
4. A coin-holder comprising two telescoping cylinders each provided with a coin-discharge opening, a partition extending transversely of one of said cylinders and forming a coin-support, a spring adapted to force the coins against said partition, and an ejector operable by the compression of the casing for discharging the coin

5. A coin-holder comprising two telescoping cylinders each having a coin-discharge opening, a slotted partition arranged in one of said cylinders for the support of the coins, a discharge-finger extending through said slot, a slide carrying said finger, and mechanism operatively connecting said slide to the end of one of the cylinders.

6. A coin-holder comprising two telescoping cylinders each having a coin-discharge opening, a slotted partition arranged in one of said cylinders for the support of a coin, a spring-pressed follower disposed within said cylinder and adapted to force the coins against the partition, a slide mounted under the partition and having an ejecting-tongue, guideways for said slide, a spring normally holding said tongue from engagement with a coin, a bell-crank lever adapted to act on said slide, a rock-shaft carried by one of the cylinders and supporting said bell-crank lever, a link pivoted to the opposite cylinder and to said bell-crank lever, and a spring tending to keep said cylinders in extended or spread position, substantially as specified.

7. A coin-holder comprising a cylinder having a coin-slot at one side and an opening or recess at a diametrically opposite portion, a slotted partition disposed in said cylinder for the support of the coins, a spring-pressed follower adapted to force the coins into contact with said partition, guideways carried by said cylinder at a point under the partition, a slide adapted to said guideways, a finger carried by the slide and normally resting in the opening in said cylinder, a spring normally tending to hold said slide and finger in cooperative position, a bell-crank lever, a shaft carried by the cylinder and supporting said bell-crank lever, a second cylinder telescopically fitting over the first cylinder and provided at one side with a coin-opening and at the opposite side with a recess or opening for the admission of the coin-engaging finger, a spring tending to hold the two cylinders in extended or spread position, a link pivoted to said second cylinder and connected to one arm of said bell-crank lever, substantially as specified.

704,782. OIL AND AIR MIXING AND GAS-GENERATING APPARATUS. JOSEPH BENN, San Francisco, Cal. Filed Jan. 16, 1902. Serial No. 90,081. (No model.)



Claim.—1. The combination in an oil-burner of independent generating-chambers one located above the other and one of said chambers having a discharge-nozzle, a casing inclosing both chambers, means for admitting air and oil into each of said chambers and means for heating the chambers.

2. The combination in an oil-burner of independent generating-chambers and an exterior containing-casing, one of said chambers being located above the other and having a discharge-nozzle at the front, connections with the rear of said chambers, means for introducing air and oil to each of said connections, means for mixing the air and oil and delivering it into the generating-chambers and means for heating said chambers.

3. The combination in an oil-burning apparatus of independent superposed generating-chambers, an exterior casing within which they are contained, the uppermost of said chambers having a discharge-nozzle at the front, burner-openings and connections between the lowermost chamber and said openings through which gas is discharged and ignited whereby the chambers are continuously heated, and means for mixing oil and compressed air and supplying them to the generators.

4. The combination in an oil-burning apparatus of independent superposed generating-chambers, an exterior casing within which they are contained, means for mixing and supplying compressed air and oil to the rear of said chambers, the lowermost having burner-openings to serve as a heater for the upper ones, and means for protecting the mixing devices from the heat of the generator, including water-jackets surrounding the connecting-passages and inlet and outlet circulating-pipes therefor.

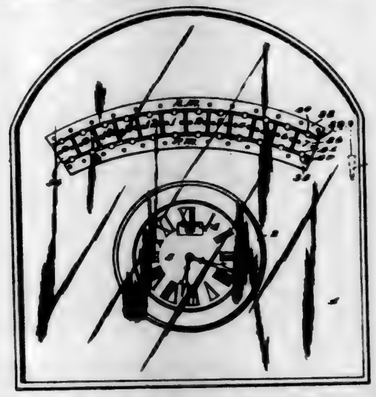
5. The combination in an oil-burning apparatus of generating-chambers and exterior casing, means for supplying oil and air to said chambers, consisting of sleeves, interior tubes each having a central opening and exterior channels within the sleeve, air-pipes connecting with the central space and oil-pipes with the exterior channels, and convergent tapering passages at the front connecting the channels with the chamber into which the air is discharged, and means therein for mixing the oil and air.

6. In an oil-burning apparatus, the generating-chambers the supply and mixing device consisting of sleeves, interior tubes with the rear of which the compressed air-pipes connect, said tubes having a passage between them and the exterior sleeves, oil-pipes delivering into said passage, conical convergent front ends with convergent channels formed upon the front of the tubes, a revolvable disk against which the compressed air and the oil are discharged, and by the rotation of which they are mixed.

7. In an oil-burning apparatus, a central tube, means for supplying compressed air thereto, exterior channels and means for supplying oil thereto, an opening at the front for the discharge of air and convergent tapering passages connecting the oil-channels with the air-receiving space, a propeller-wheel the shaft of which is journaled in said receiving-space, so that the passing air-jet will revolve the propeller and a disk carried by the propeller-shaft contiguous to the air and oil discharge passages and acting as a mixer thereby.

8. In an oil-burning apparatus, the generating-chambers and exterior containing casing, means for mixing air and oil and supplying it into said chambers consisting of a revolvable propeller-wheel located in the passage connecting with the generators, a disk carried upon the rear end of the shaft of said propeller, a tubular conductor through which compressed air is discharged against the disk, an annular chamber surrounding said conductor, means for delivering oil into said chamber and convergent tapering channels connecting said chamber with the space in which the revolvable disk is rotated whereby the oil is subdivided and mixed with the air before delivering into the generators.

704,783. ELECTRIC ALARM-CLOCK. WALTER C. BETHEL, Seattle, Wash. Filed Feb. 7, 1902. Serial No. 93,006. (No model.)



Claim.—1. In an electric alarm-clock, the combination with the hour-hand-operating means thereof, of an arm carried thereby, a contact-brush carried by said arm, contact-plates corresponding in number relative to the time indications on the dial of said clock designed to be contacted by said brush, and a wheel having radial arms for closing an electric circuit through said plates and brush and alarm mechanism to be operated, the arm of said wheel extending in the plane of movement of said arm substantially as described.

2. In an electrical alarm-clock, the combination with a suitable support, of an hour-hand-operating means carried thereby, a series of plates secured to said support, a second series of plates secured to said support, a plate spaced from said second series, and a wheel rotating in timed relation to the movement of said hour-hand-operating mechanism for alternately establishing electric communication through one of the first series of plates, and through one of the second series of plates, whereby when communication is established between said first-mentioned plate and one of the plates of one of said series relative to the position of said hour-hand-operating mechanism, electric communication will be established through said hour-hand-operating means, and through any suitable alarm device, substantially as described.

3. In an electric alarm-clock, the combination with a suitable hour-hand-operating mechanism, of an arm carried thereby, a plate representing the hours of the forenoon, a plate representing the hours of the afternoon, means operated by said arm for establishing electric communication with the respective forenoon or afternoon plates according to the position of the said hour-hand, and a contact-wheel rotating in timed relation to the movement of said hour-hand-operating mechanism for closing the electric circuit for passing the current through a suitable alarm mechanism at predetermined times, substantially as described.

4. In an alarm-clock, the combination with any suitable support, of a circuit-closing wheel mounted thereon, two plates carried by said support, means for moving said circuit-closing wheel for causing electric communication through one of said plates, and then through the other thereof relative to the position of the hands of said clock, and means for closing the circuit of electricity through either of said plates through any suitable alarm mechanism, substantially as described.

5. In an alarm-clock, the combination with a suitable support, of means carrying the hands of the clock supported thereby, a contact-wheel carried by said support, an arm carried by said hand-operating means designed to operate said contact-wheel, plates representing the forenoon and afternoon, means for establishing communication from said contact-wheel alternately with said plates relative to the position of the said hands, and means for establishing electric communication with any desired alarm mechanism, at a predetermined time through one of said plates, substantially as described.

6. In an alarm-clock, the combination with a suitable support, of clock-hand-operating means, an arm carried thereby, a contact-wheel carried by said support and provided with radially-extending arms designed to project into the path of movement of said first-mentioned arm, whereby said wheel will be rotated a quarter of a circle at each rotation of said first-mentioned arm, studs designed to contact with the alternate arms of said contact-wheel, plates carried by said support, means establishing electric communication between each of said contact-studs and one of said plates, and means for establishing electric communication through one of said plates and through any suitable alarm mechanism at predetermined times, substantially as described.

7. In an alarm-clock, the combination with a suitable support, of a contact-wheel mounted thereon, provided with radially-extending arms, contact-studs designed to contact alternately with the arms of said wheel as the same rotates, means for establishing electric communication through said wheel and one of said studs and through any suitable alarm mechanism, at a predetermined time, and means for rotating said wheel relative to the movement of the hands of said clock, substantially as described.

8. In an alarm-clock, the combination with a suitable support, of a contact-wheel mounted thereon and provided with radially-extending arms, each alternate arm being bent laterally in an opposite direction to the next succeeding arm, so that the said arms will move in different horizontal planes, studs mounted above and below said wheel and designed to contact with the respective alternate arms thereof, means for establishing electric communication through said wheel and one of said studs, through any suitable alarm mechanism at a predetermined time, and means for rotating said wheel relative to the movement of the hands of said clock, substantially as described.

9. In an alarm-clock, the combination with a suitable support provided with a dial and means for operating the clock-hands, the said dial being formed with an aperture, of a contact-wheel provided with radially-projecting arms designed to be moved successively in said aperture, means for establishing electric communication through one of the arms of said wheel, and through any desired form of alarm apparatus relative to the position of the respective arms of said wheel, and means for rotating said wheel corresponding to the movement of the hands of said clock, substantially as described.

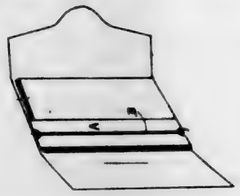
10. In an alarm-clock, the combination with a suitable support, of a series of plates arranged on the rear face thereof, a corresponding series of plates secured upon said support, a comparatively long plate arranged above and a similar plate arranged below said second series of plates, means for establishing electric communication between said last-mentioned plates, means for establishing electric communication between each of said first-mentioned plates and its corresponding plate of the second-mentioned series of plates, and means for establishing electric communication through one of the first-mentioned series of plates, through its corresponding plate

of the second-mentioned series, and through an alarm device relative to the position of the hands of said clock, substantially as described.

11. In an alarm-clock, the combination with a suitable support, of means for operating the hands of said clock, a series of plates secured to said support, having insulating-strips beneath the same, a laterally-projecting lug formed upon each of said plates, extending beneath the insulating-strip of the preceding plate, a contact-brush, means for bringing the same successively into contact with each plates relative to the movement of the hand-operating means, and means for establishing electric communication through said plates and through a suitable alarm device at a predetermined time, substantially as described.

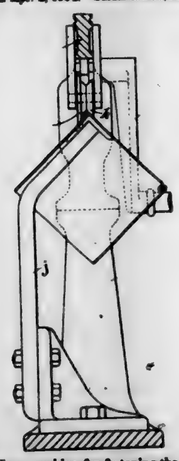
12. In an alarm-clock, the combination with a suitable support, of an hour-hand-operating means carried thereby, an arm carried by said operating means, a series of plates arranged in a circle on said support, each of said plates being provided with a lug extending beneath the next preceding plate and insulated therefrom, a brush carried by said arm and designed to contact with a portion of each of said lugs and each of said plates successively as the arm is moved with the movement of said hand-operating means, and means for establishing electric communication through said arm and brush, through the lug and plate contacted thereby, and through a suitable alarm device, substantially as described.

704,784. PAPER-HOLDER. ELIE BRUGEROLLES, Brassac-les-Mines, France. Filed June 9, 1896. Renewed June 16, 1902. Serial No. 111,997. (No model.)



Claim.—A device for the purpose set forth consisting of a cardboard wrapper A, provided with incisions in its longitudinal edges where said wrapper is to be folded, an elastic band arranged transversely around the wrapper and lying within the incisions and adapted to grip a series of leaves inserted within the wrapper, and a cover C to which the wrapper is secured.

704,785. MACHINE FOR FASTENING THE BOTTOMS IN ANGULAR VESSELS OF SHEET METAL. WILHELM CARLUDE, Lund, Sweden, assignor to Aktiebolaget Blockvarufabriken I. Lund, Lund, Sweden. Filed Apr. 2, 1901. Serial No. 54,045. (No model.)



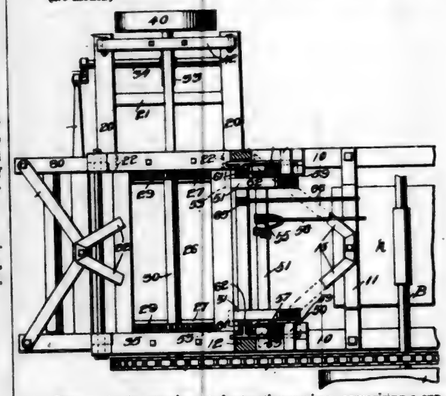
Claim.—1. In a machine for fastening the bottoms in angular cans, a support for the can having inclined faces corresponding to the plane of the bottom and side to be jointed and comprising a substantially angular bar to hold the bottom and side to be jointed in inclined position, and means having a groove therein complementary to the support, adapted to coöperate therewith to close the seam, the bisector of the angle formed by the inclined faces and that of the groove substantially in alinement, whereby the sides of said groove will exert a vertical pressure on the seam and bottom, substantially as described.

2. In a machine for fastening the bottoms in angular cans, a bar to support the can having two inclined faces having the same angular section as the bottom and side to be jointed to hold the bottom and side inclined, and a reciprocable roller having an angular groove therein complementary to the support and adapted to coöperate with the support to close the seam, the bisector of the angle formed by the inclined faces and that of the groove substantially in alinement, whereby a vertical pressure will be exerted on both the seam and the bottom of the can, substantially as described.

3. In a machine for fastening the bottoms in angular cans, a substantially V-shaped rail, the sides of which have the same angular relation as the side and bottom to be jointed, to hold the side and bottom of the can inclined, a reciprocable roller having a V-shaped groove therein to ride over the rail and an offset on one side of the roller substantially equal to the thickness of the metal turned over, whereby the interior of the can at the joint will have plane meeting surfaces, substantially as described.

4. In a machine for fastening the bottoms in angular cans, a substantially V-shaped rail shorter than the width of a side of the can, the medial line of the angle of said rail vertical and a roller having a complementary groove to roll on said rail and provided with an offset on one side substantially equal to the thickness of the metal turned over, whereby the interior meeting surfaces of the can are plane and the edges securely fastened, substantially as described.

704,786. ATTACHMENT FOR TRACTION-ENGINES. DANIEL W. COMBS, Keedmore, W. Va. Filed Apr. 16, 1902. Serial No. 103,185. (No model.)



Claim.—1. An attachment for traction-engines, comprising a supporting-frame, a pair of shafts carried thereby, gearing connecting said shafts, a winding-drum carried by one of the shafts, a hauling-line connected to said drum, and means for moving one of said shafts toward and from the other to connect and disconnect the gearing.

2. An attachment for traction-engines, comprising a supporting-frame having a movable portion, a shaft carried by the stationary portion of the frame, a shaft carried by the movable portion of the frame, a winding-drum carried by one of said shafts, gearing connecting the shaft, and means for adjusting the movable portion of the frame to connect and disconnect said gearing.

3. An attachment for traction-engines, comprising a supporting-frame having a movable portion, a shaft carried by the stationary portion of the frame, a shaft carried by the movable portion of the frame, a winding-drum carried by one of said shafts, gearing connecting the shafts means for adjusting the movable portion of the frame to connect and disconnect said gearing, and means for locking said frame in either of its two positions.

4. An attachment for traction-engines, comprising a supporting-frame, a pair of shafts carried thereby, a winding-drum on one of said shafts, a power-transmitting wheel mounted on the second shaft, gearing connecting the shafts, means for connecting and disconnecting said gearing, a hauling-line connected to the winding-drum, a line-guide, means for supporting the same, an auxiliary shaft, a worm-wheel mounted thereon, a worm carried by the drum-shaft and intermeshing with said worm-wheel, a crank on the auxiliary shaft, and a rod connecting said crank the line-guide.

5. An attachment for traction-engines, comprising a supporting-frame, a pair of shafts carried thereby, a winding-drum on one of said shafts, a power-transmitting wheel mounted on the second shaft, gearing connecting the shafts means for connecting and disconnecting said gearing, a hauling-line connected to the winding-drum, a pair of transversely-disposed bars having guiding-slots, a frame guided in said slots, antifriction-rollers journaled in said frame and serving as guides for the hauling-line, a crank-shaft operatively connected to said frame, and worm-gearing connecting the crank-shaft to the drum-shaft.

6. An attachment for traction-engines, comprising a supporting-frame, a winding-drum mounted thereon, means for revolving said drum, a hauling-line connected to the drum, a pair of vertically-disposed antifriction-rollers mounted in front of and at each end of the drum, and a pair of horizontally-disposed antifriction-rollers arranged on lines parallel with the longitudinal axis of said drum.

7. An attachment for traction-engines, comprising a supporting-frame, a shaft carried thereby, a drum mounted on said shaft, gear-wheels secured to the shaft and drum, a pivoted frame, a shaft carried thereby, pinions mounted on said shaft and adapted to intermesh with the gear-wheels of the drum-shaft, a rock-shaft, notched cams thereon adapted to engage with and move the pivoted frame, and means for locking said frame in elevated or depressed position.

8. An attachment for traction-engines, comprising a supporting-frame, a drum-shaft carried thereby, a winding-drum and gear-wheels carried by said shaft, a pivoted frame, a shaft carried thereby, pinions carried by said shaft and adapted to intermesh with the gear-wheel, a rock-shaft, means for operating the same, notched disks carried by said shafts for actuating the frame, and means for simultaneously locking the frame and disks.

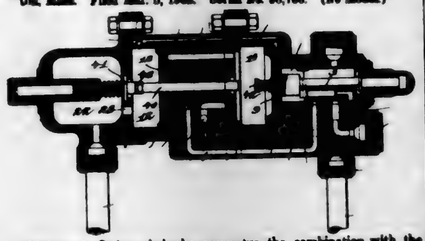
9. An attachment for traction-engines, comprising a stationary and a movable frame, shafts carried by each portion of the frame, a winding-drum carried by one of said shafts, gearing connecting the shaft, a rock-shaft, notched disks for engaging the movable frame and adjusting the position thereof, and spring-pressed locking-rods for locking said frame and disk.

10. An attachment for traction-engines, comprising a stationary frame, a pivoted frame carried thereby, shafts carried by each of said frames, a winding-drum carried by one of said shafts, gearing connecting the shafts, a rock-shaft, notched disks carried by the rock-shaft and adapted to engage with and adjust the position of the pivoted frame, spring-pressed locking rods for locking the pivoted frame in either depressed or elevated position, the rear ends of said rods having arms for engagement in notches in said disks.

11. An attachment for traction-engines, comprising a stationary frame, a pivoted frame carried thereby, shafts carried by each of said frames, a winding-drum carried by one of said shafts, gearing connecting the shafts, a pair of rock-shafts each having operating-levers, disks carried by one of said rock-shafts, each of said disks having a pair of locking-slots and being provided with a notched portion for engagement with the pivoted frame, a guided locking-rod adapted to engage both the pivoted frame and the slots of the disk, a pair of spring-pressed arms carried by the second rock-shaft, and arms carried by the locking-rods and connected to said spring-pressed arms.

12. An attachment for traction-engines, comprising a main supporting-frame having a pair of shafts, a winding-drum on one of said shafts, a power-transmitting wheel on the second shaft, a sprocket-wheel mounted on said second shaft and connected to the driving-engine, and an auxiliary frame adapted to be secured to either side of the main frame, said auxiliary frame having bearings for the support of the outer ends of said pair of shafts.

704,787. AIR-BRAKE APPARATUS. EDWARD F. DONNELLY, Boston, Mass. Filed Mar. 5, 1902. Serial No. 96,766. (No model.)



Claim.—1. In an air-brake apparatus, the combination with the usual triple valve, auxiliary reservoir, brake-cylinder, and main train-pipe, of a chamber having a movable partition therein, the chamber on one side of said partition having communication with the main train-pipe, means to vary the pressure on the other side of said partition independently of the train-pipe pressure, and a supplemental valve operated by the movements of the partition, said valve controlling the exhaust from the brake-cylinder.

2. The combination, with the usual triple valve, of a chamber having a movable partition therein, the chamber on one side of said partition having communication with the main train-pipe, means under the control of the engineer to vary the air-pressure on the other side of said partition independently of the train-pipe pressure, and a supplemental valve connected to and operated by the movements of the partition, said valve controlling the exhaust from the brake-cylinder.

3. A triple valve controlling communication between the auxiliary reservoir and brake-cylinder, a chamber having a piston therein, a supplemental valve operated by said piston and controlling the exhaust from the brake-cylinder, one side of said piston being subjected to the pressure in the train-pipe, and means to vary the pressure on the other side of said piston independently of the train-pipe pressure, whereby the supplemental valve may be operated independently of the triple valve.

4. A triple valve controlling communication between the auxiliary reservoir and brake-cylinder, a chamber having a piston therein, a supplemental valve operated by said piston and controlling the exhaust from the brake-cylinder, one side of said piston being subjected to the pressure in the train-pipe, and means under the control of the engineer to vary the air-pressure on the other side of said piston independently of the train-pipe pressure, whereby the supplemental valve may be operated independently of the triple valve.

5. In an air-brake apparatus, main and auxiliary train-pipes, a triple valve controlling the supply of air to the brake-cylinder and adapted to be operated by variations of pressure in the main train-pipe, a chamber having a movable partition therein, a chamber on one side of the partition being connected to the main train-pipe, and on the other side to the auxiliary train-pipe, a supplemental valve operated by movements of the partition, said valve controlling the exhaust from the brake-cylinder, and means to vary independently the pressure in the main and auxiliary train-pipes.

6. In an air-brake apparatus, main and auxiliary train-pipes, a triple valve, a chamber having a leak-groove in its side, a piston in said chamber, a supplemental valve controlling the exhaust from the brake-cylinder, said valve being connected to and operated by the piston, the chamber on one side of the piston having communication with the main train-pipe, and on the other side with the auxiliary train-pipe.

7. In an air-brake apparatus, main and auxiliary train-pipes, a triple valve controlled by the pressure in the main train-pipe, and a supplemental valve controlling the exhaust from the brake-cylinder, said supplemental valve being controlled by the difference in the pressure in the main and auxiliary train-pipes.

8. In an air-brake apparatus, main and auxiliary train-pipes, a triple valve controlled by the pressure in the main train-pipe, a chamber connected with both the main and auxiliary train-pipes, a piston in said chamber, a supplemental valve controlling the exhaust from the brake-cylinder and operated by said piston, and means for varying the air-pressure in the main and auxiliary train-pipes independently.

9. In an air-brake apparatus, main and auxiliary train-pipes, a triple valve controlled by the pressure in the main train-pipe, a chamber having communication with both the auxiliary and main train-pipes, a piston in said chamber, a supplemental valve controlling the exhaust from the brake-cylinder and operated by said piston, means for varying the air-pressure in the main and auxiliary train-pipes independently, and a by-pass connecting the said chamber with the brake-cylinder.

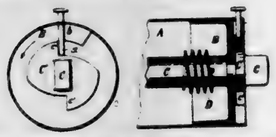
10. In an air-brake apparatus, a triple valve including a piston operating in a chamber, a supplemental chamber connected to said first-named chamber, a supplemental piston operating in said supplemental chamber, means operated by the supplemental piston to control the exhaust from the brake-cylinder, and means for controlling the air-pressure on the two sides of the supplemental piston independently.

11. In an air-brake apparatus, a triple valve including a piston operating in a chamber, a supplemental chamber having communication with the first-named chamber, a supplemental piston operating in said supplemental chamber, an exhaust-valve from the brake-cylinder controlled by the supplemental piston, a pin freely slidable through the latter, and a spring-stop adapted to be engaged by the pin, the construction being such that when the triple valve is operated its movement is controlled by the spring-stop through the said pin.

704,788. SHADE-ROLLER. OLIVER M. EDWARDS, Syracuse, N. Y. Filed Feb. 26, 1900. Serial No. 6,543. (No model.)

Claim.—1. In a shade-roller the combination, substantially as set

forth, of a barrel provided with a fixed abutting surface, a spindle provided with a fixed abutting surface arranged with a portion of such surface in a circle of greater diameter than the body of the spindle, a spring one end of which is connected with the barrel and the other is connected with the spindle, and means adapted to engage with the abutting surfaces, said means being employed solely for locking the spindle to the roller, and normally free from the locking position between the abutting surfaces but manually movable to such locking position.



2. In a shade-roller the combination, substantially as set forth, of a barrel provided with a fixed abutting surface, a spindle provided with a fixed abutting surface arranged with a portion of such surface in a circle of greater diameter than the body of the spindle, one of which surfaces is undercut, a spring one end of which is connected with the barrel and the other is connected with the spindle, and means adapted to engage with the undercut surface, said means being employed solely for locking the spindle to the roller, and normally free from the locking position between the abutting surfaces but manually movable to such locking position.

3. In a shade-roller the combination, substantially as set forth, of a barrel provided with a fixed abutting surface, a spindle provided with a fixed abutting surface arranged with a portion of such surface in a circle of greater diameter than the body of the spindle, a spring one end of which is connected with the barrel and the other is connected with the spindle, and a device independent of the roller adapted to be manually inserted between the abutting surfaces, whereby the spindle and barrel may be locked together and thus be held until after the roller is placed in working position in its brackets.

4. In a shade-roller the combination, substantially as set forth, of a barrel provided with a fixed abutting surface, a spindle provided with a fixed abutting surface arranged with a portion of such surface in a circle of greater diameter than the body of the spindle, the two abutting surfaces being arranged in the same radial plane, a spring one end of which is connected with the barrel and the other is connected with the spindle, and a device independent of the roller adapted to be manually inserted between the abutting surfaces, whereby the spindle and barrel may be locked together and thus be held until after the roller has been placed in working position in its brackets.

5. In a shade-roller the combination, substantially as set forth, of a barrel provided with a fixed abutting surface, a spindle provided with a fixed abutting surface, arranged with a portion of such surface in a circle of greater diameter than the body of the spindle, the two abutting surfaces being arranged for one to pass in close proximity to the other, a spring one end of which is connected with the barrel and the other is connected with the spindle, and a device independent of the roller adapted to be manually inserted between the abutting surfaces, whereby the spindle and barrel may be locked together and be thus held until after the roller is placed in working position in its brackets.

6. In a shade-roller the combination, substantially as set forth, of a barrel provided with a fixed abutting surface, a spindle provided with a plurality of fixed abutting surfaces arranged with a portion of such surfaces in a circle of greater diameter than the body of the spindle, a spring one end of which is connected with the barrel and the other is connected with the spindle, and a device independent of the roller adapted to be manually inserted between the abutting surfaces, whereby the spindle and barrel may be locked together at different points on the spindle and thus be held until after the roller is placed in working position in its brackets.

7. In a shade-roller the combination, substantially as set forth, of a barrel provided with a plurality of fixed abutting surfaces, a spindle provided with a plurality of fixed abutting surfaces arranged with a portion of such surfaces in a circle of greater diameter than the body of the spindle, a spring one end of which is connected with the barrel and the other is connected with the spindle, and a device independent of the roller adapted to be manually inserted between any one of the abutting surfaces on the barrel and any one on the spindle, whereby the spindle and barrel may be locked together at different points on the spindle and of the revolution of the barrel and be thus held until after the roller is placed in working position in its brackets.

8. In a shade-roller the combination, substantially as set forth, of a barrel provided with a fixed abutting surface, a spindle provided with a fixed abutting surface arranged with a portion of such surface in a circle of greater diameter than the body of the spindle, the two abutting surfaces being arranged to frictionally hold a device independent of the roller adapted to be manually inserted between them, and a spring one end of which is connected with the barrel and the other is connected with the spindle whereby the spindle and barrel may be locked together by the manual insertion of a device independent of the roller between the abutting surfaces and be thus held until after the roller is placed in working position in its brackets.

9. In a shade-roller the combination, substantially as set forth, of a barrel provided with a fixed abutting surface, a spindle provided with a fixed abutting surface open or accessible from the end of the roller in a circle of greater diameter than the body of the spindle, a spring one end of which is connected with the barrel and the other with the spindle, and a device independent of the roller adapted to be manually inserted between the abutting surfaces from the end of the roller, whereby the spindle and barrel may be locked together by a device manually inserted between the surfaces from the end of the roller by the access given to that portion of the surface on the spindle which is thus open or accessible in a circle of greater diameter than the body of the spindle and is held locked until after the roller is placed in working position in its brackets.

10. In a shade-roller the combination, substantially as set forth, of a barrel provided with a fixed abutting surface open or accessible from the end of the roller in a circle of larger diameter than the body of the spindle, a spindle provided with a fixed abutting surface, a spring one end of which is connected with the barrel and the other is connected with the spindle, and a device independent of the roller adapted to be manually inserted between the abutting surfaces from the end of the roller, whereby the spindle and barrel may be locked together by a device manually inserted between the surfaces from the end of the roller by the access given to that portion of the surface on the barrel which is thus open or accessible and be held locked until after the roller is placed in working position in its brackets.

704,739. SECONDARY BATTERY. JUSTUS B. ENTZ, Philadelphia, Pa., assignor to the Electric Storage Battery Company, Philadelphia, Pa., a Corporation of New Jersey. Filed Oct. 3, 1900. Serial No. 31,908. (No model.)

Claim.—1. A malleated antimonious-lead grid for a storage-battery plate, substantially as described.

2. A malleated antimonious-lead grid punctured to form tangs or keys for holding the active material or material to become active of a storage-battery plate, substantially as described.

3. A malleated antimonious-lead grid bent to form keys for holding the active material or material to become active of a storage-battery plate, substantially as described.

704,740. EXCAVATING AND LOADING APPARATUS. WASHINGTON FOGLESONG, Dayton, Ohio, assignor of one-half to John Collins, Dayton, Ohio. Filed Oct. 22, 1901. Serial No. 79,534. (No model.)

Claim.—1. In an excavating and loading apparatus, the combination with the main frame, of supporting and driving wheels therefor, a motor carried by said main frame and connected with the driving-wheel, a scoop-supporting frame pivotally mounted on said main frame, a scoop connected to said pivoted frame, a cam-shaft provided with cams for engaging said pivoted frame to raise and lower said scoop and connections between the motor and said cam-shaft, substantially as described.

2. In an excavating and loading apparatus, the combination with the main frame, of a scoop-supporting frame pivoted to the main frame, a scoop carried by said pivoted frame, mechanism for raising and lowering said pivoted frame, and mechanism for automatically maintaining said scoop always in a horizontal position, substantially as described.

3. In an excavating and loading apparatus, the combination with the main frame, of a scoop-supporting frame pivoted thereto, a scoop pivotally connected to said pivoted frame, a connection between said scoop and the main frame for maintaining the scoop continually in a horizontal position and mechanism for raising and lowering said pivoted frame, substantially as described.

4. In an excavating and loading apparatus, the combination with the main frame, of a pivoted scoop-supporting frame carried thereby, a scoop carried by said pivoted frame, a cam-shaft mounted on the main frame and provided with lifting-cams engaging said pivoted frame, and mechanism for imparting a half-revolution to said cam-shaft, substantially as described.

5. In an excavating and loading apparatus, the combination with the main frame, of a pivoted scoop-supporting frame carried thereby, a scoop carried by said pivoted frame, a cam-shaft mounted on the main frame and provided with lifting-cams engaging said pivoted frame, driving mechanism for said cam-shaft including a part loose on said shaft, and a part secured to said shaft, one of said parts being provided with a clutch-bolt, and the other with a recess to receive the same, a wedge secured to a stationary part and adapted to engage said bolt to withdraw the same from engagement with the recess of the other part, and means for moving said wedge into and out of the path of said bolt, substantially as described.

6. In an excavating and loading apparatus, the combination with the main frame, of a scoop-supporting frame pivoted thereto, a scoop carried by said pivoted frame and provided with a sliding end board, a crank carried by said pivoted frame, operative connections between said crank and said end board for dumping the contents of the scoop and mechanism for operating said crank, substantially as described.

7. In an excavating and loading apparatus, the combination with the main frame, of a scoop-supporting frame pivoted thereto, a scoop carried by said pivoted frame and provided with a sliding end board, devices carried by said pivoted frame for operating said end board, and mechanism carried by the main frame operatively connected with said end-board-operating devices, substantially as described.

8. In an excavating and loading apparatus, the combination with the main frame, of a scoop-supporting frame pivoted thereto, a scoop carried by said pivoted frame and provided with a sliding end board, a crank carried by said pivoted frame, operative connections between said crank and said end board, a motor carried by said main frame, connections between said motor and said crank including a clutch for imparting a single complete revolution to said crank, substantially as described.

9. In an excavating and loading apparatus, the combination with the main frame, and a power-shaft mounted thereon, of a scoop-supporting frame pivoted on said shaft, a scoop secured to said pivoted frame and provided with a movable end board, a crank carried by said pivoted frame and connected to said end board, a driving-gear connected to said crank, a driving-gear on said power-shaft engaging said first-mentioned gear, and mechanism for raising and lowering said pivoted frame, substantially as described.

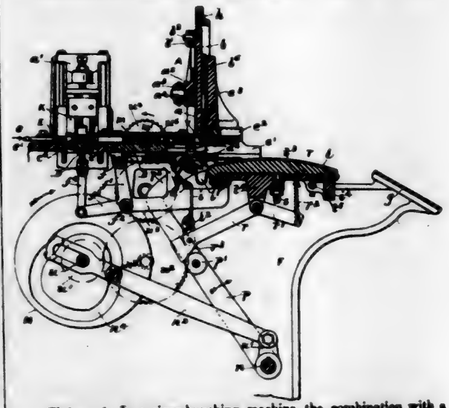
10. In an excavating and loading apparatus, the combination with the main frame provided with supporting and driving wheels, a motor carried by said main frame, connected with the driving-wheel thereof, a pivoted scoop-supporting frame secured to said main frame, a scoop carried thereby, a cam-shaft mounted on said main frame and provided with cams for raising and lowering said pivoted frame and scoop, a crank on said pivoted frame, a movable end board in said scoop, connections between said end board and said crank and connections between said crank and said motor, substantially as described.

704,741. TRACE-FASTENER. SAMUEL E. FOREMAN, Paducah, Ky. Filed Nov. 22, 1901. Serial No. 83,291. (No model.)

Claim.—1. A trace-fastener comprising a slide adapted to the trace, a vertically-disposed eye formed at the rear end of said slide, a spring-wire bail pivotally mounted in said eye, and balls arranged at the ends of said wire bail and adapted for engagement with seating-recesses in the singletree.

2. A trace-fastener comprising a slide 8 adapted to be mounted on the trace and having side wings 9 adapted to embrace the edges of said trace, a vertically-disposed eye 10 formed at the rear of said slide, a spring-wire bail 11 centrally mounted in said eye, and balls arranged at the ends of said wire bail and adapted for engagement with seating-recesses formed in the opposite sides of the singletree, substantially as specified.

704,742. CIGAR-BUNCHING MACHINE. MICHAEL M. GARDNER, Edgewood, R. I. Filed Aug. 17, 1901. Serial No. 72,366. (No model.)



Claim.—1. In a cigar-bunching machine, the combination with a magazine for containing the suitably-prepared fillers and a charging-pocket in normal open communication therewith to receive fillers therefrom, of a mechanically-actuated knife interposed between the mouth of said magazine and pocket for severing the fillers into charges, a mechanically-slidable plate forming the lower side of the charging-pocket, and a vertically-actuated ejector consisting of two members having different degrees of movement arranged to discharge the filler-charge after the said bottom plate has uncovered the pocket, substantially as described.

2. In a cigar-bunching machine, the combination with a suitable magazine containing the previously-prepared tobacco or fillers adapted to be successively divided into charges and be converted into bunches, of a normally open separable pocket communicating with the magazine, a knife for severing the fillers contained in the pocket and at the same time closing the latter from the magazine, a plate forming the bottom of the pocket, an ejector consisting of two vertically-movable detachably-connected members forming the front and upper sides of the pocket, and mechanisms for actuating said knife, plate and ejector members.

3. In a cigar-bunching machine, the charge-severing knife *a*, an ejector located contiguous thereto consisting of independently-movable members, *b*, *b'*, and forming two sides of the normally open charging-pocket *v*, means for feeding the fillers of tobacco into said pocket, and mechanism for actuating said knife to sever the fillers thereby at the same time closing the adjacent side of the pocket, in combination with the mechanically-slidable bottom plate *v'* forming the lower side of the charging-pocket, and means for depressing the ejector and discharging the charge of fillers downwardly from said pocket after the bottom plate has uncovered the latter, substantially as described.

4. In a cigar-bunching machine, the combination with the charging-pocket arranged to receive the charge of fillers, and a mechanically-actuated charge-rolling apron *i* having an open bight therein arranged below and substantially in alinement with said pocket, of a binder-holding device, means for yieldingly retaining the binder in position thereby forming a bridge across the bight-opening, and means for opening said pocket and discharging the charge of fillers therefrom onto the apron, the action of this latter mechanism also being to force the material or to-

bacco against the binder, whereby an end of the latter is drawn out from the said retainer, the thus-released portion of the binder falling onto the apron substantially with or slightly in advance of the charge, substantially as described.

5. In a cigar-bunching machine, the combination of a mechanically-actuated charge-rolling device provided with an apron having an open bight, mechanism for discharging the suitably-prepared charge of fillers into the bight and a yielding binder-holding device, connected with and moving in unison with said charge-rolling means, frictionally retaining both ends of the binder, whereby the latter is maintained under suitable tension across the apron's bight until released by the action of said discharging mechanism, substantially as described.

6. In a cigar-bunching machine, the combination with a stationary table t^3, and a charge-rolling apron i supported by said table arranged to receive the charge of fillers in a bight formed therein, of a pair of vibrating levers p, a forming-roll mounted in and actuated by said levers and in engagement with the apron, and a drag-roll and clip also mounted in said levers and forming a binder-holding device, substantially as described.

7. In a cigar-bunching machine, a suitably-mounted charge-rolling apron i, means for actuating the apron, a binder-retaining device in frictional engagement with both ends of the binder, whereby the latter is maintained flatwise under suitable tension with respect to the apron, and means for discharging the charge of fillers onto the apron, in combination with a spring-pressed lever connected with one end of said apron, means for actuating the lever and a stop for limiting its angular movement, substantially as described and for the purpose hereinbefore set forth.

8. In a cigar-bunching machine, the combination of an apron i, a forming-roll in engagement with the apron, mechanically-actuated levers or arms carrying said roll, a spring-pressed lever r connected with the rear end of said apron, said lever r being actuated in one direction by the roll-carrying arms to temporarily slacken the apron to increase the depth of the bight, and a stop s for limiting the lever's movement in the other direction so as to control the normal depth of the bight, substantially as described.

9. In charge-rolling mechanism for cigar-bunching machines, the combination of an apron i, a forming-roll d^2 in engagement with the apron, means for actuating the roll to and fro, a binder-supporting plate p^3 arranged in front of and moving in unison with said roll, a clip for holding an end of the binder, a drag-roll for holding the other portion of the binder flatwise upon said plate p^3, and a stop or dog located in the path of the movable drag-roll, whereby the latter is automatically elevated so as to permit the introduction of a new binder, substantially as described.

10. In a cigar-bunching machine having a stationary rolling-table t^3 and an inclined binder-supporting table g at the front or delivery end of the machine, the combination therewith of the charge-rolling apron i, the oscillating lever p for actuating said apron having its upper portion provided with a plate p^3 adapted to pass between the said stationary tables t^3 and g, means consisting of a spring-clip l and drag-roll d^3 adapted to hold the binder between them, whereby after introducing the binder into the clip the rearward movement of the lever p uncovers the plate p^3 and at the same time permits the roll d^3 to frictionally engage the binder and draw it rearwardly from its table preliminary to returning the apron, to the normal position to receive the succeeding charge.

11. In a cigar-bunching machine, the combination with the magazine m containing the fillers, and a charging-pocket v communicating therewith and adapted to receive the fillers therefrom, of the charge-severing knife a, means for uncovering the lower side of said pocket, a reciprocating ejector b, the front plate b^2, mechanism for actuating said members b and b^2 for ejecting the charge of fillers from the pocket, means for stopping the downward movement of said plate while the ejector continues its downward action and means for detachably connecting the ejector and said plate whereby the same becomes automatically detached therefrom during such movement, substantially as described.

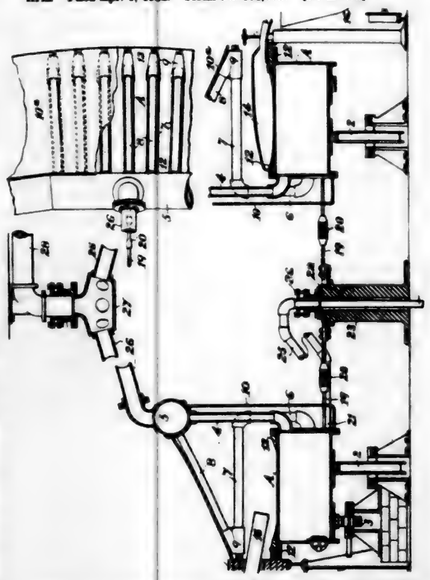
12. In a cigar-bunching machine, the combination with the filler-containing magazine, a charging-pocket v adapted to receive a charge of fillers therefrom, upper and lower shear-plates located at the mouth of said magazine, and an adjustably-secured front member or bracket c^3, of the reciprocating knife a arranged to coact with said shear-plates in severing the charge of fillers, an ejector interposed between said knife and bracket members having its lower portion adapted to form two sides of the charging-pocket, and means for opening the pocket and actuating said ejector whereby the fillers are discharged, substantially as described.

13. In a cigar-bunching machine, the combination of an ejector member, a front plate relatively movable longitudinally and detachably connected thereto and when in its normal position extending a short distance below the end of the ejector, a bottom plate, a knife a mounted contiguous to and capable of movement independently of said ejector, and mechanisms, substantially as described, for actuating all the said members in a predetermined order for the purpose hereinbefore set forth.

14. In a cigar-bunching machine, the combination with a magazine for containing the fillers of tobacco, and an endwise-movable plate member v' forming a continuation of the lower side of the magazine, of a filler-severing knife a arranged at right angles to said magazine, an ejector located contiguous to and parallel with the knife, a front plate relatively movable longitudinally and detachably connected to the corresponding face of the ejector, and mechanisms for actuating and controlling the movements of all the said members independently of one another and in a prearranged order, substantially as described.

15. In a cigar-bunching machine, the combination with a magazine for containing the fillers of tobacco and means for feeding the fillers therein, of the knife a, the ejector b, the front plate b^2 relatively movable longitudinally and detachably connected to said ejector, the bottom plate member v', the said members, a, b, b^2, v', forming a separable charging-pocket v in direct communication with the front end of the magazine, and mechanisms for actuating said members in a prearranged order, substantially as hereinbefore described and for the purpose set forth.

704,748. STEAM-GENERATOR. JOSEPH L. GIROUX, Jerome, Ariz. Filed Apr. 9, 1902. Serial No. 101,979. (No model.)



Claim.—1. A steam-generator consisting of a revolubly water-chamber, a steam-drum located above said chamber, circulating-pipes connecting the two, means for supplying water to and conducting steam from the apparatus, and means for applying heat thereto.

2. A steam-generator consisting of an annular revolubly water-chamber, an annular steam-drum located above said chamber, circulating and conducting pipes connecting the two, and a screen or housing inclosing said pipes and forming a heating-space above the water-chamber.

3. A steam-generator consisting of an annular horizontally-revolubly water-chamber and means for applying a heating medium thereto, an annular steam-drum located above said chamber, vertical circulating-pipes connecting the chamber and drum, other horizontal and diagonal connecting-pipes extending above the water-chamber and forming an intermediate heating-space, and vertical and diagonal shields inclosing said connecting-pipes.

4. A steam-generator consisting of an annular revolubly water-chamber having elevated annular rims around the inner and outer periphery, means for supplying fuel to the channel thus formed, an annular steam-drum located above and interior to the inner line of the water-chamber, vertical circulating-pipes connecting the water-chamber and steam-drum, horizontal and diagonal pipes extending above the fuel-space and connecting the water-chamber and steam-drum, and shields inclosing said pipes and forming a furnace-chamber.

5. A steam-generator consisting of a revolubly circular water-chamber rectangular in cross-section and having a fuel-space formed on the top, a circular steam-drum located above said chamber, vertical circulating-pipes connecting the chamber and drum, horizontal and diagonal connecting-pipes extending above the water-chamber with an inclosing shield or housing, and a fixed surrounding wall within which the outer periphery of the water-chamber and the top shield turn in close proximity.

704,744. ELECTRIC ACCUMULATOR. HERMANN HEINICKE, Schoeneberg, near Berlin, Germany. Filed Apr. 23, 1902. Serial No. 105,068. (No model.)

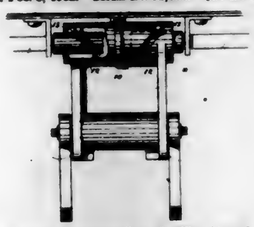
Claim.—An accumulator-electrode comprising a conducting-base presenting angular grooves extending from the top downward, and substantially horizontal strips, inclining inward and connecting the outer portions of each groove formed by adjacent walls, substantially as and for the purpose hereinbefore set forth.

704,745. GAS-BURNER. ASHLEY M. HEWETT, Chicago, Ill. Filed Aug. 26, 1901. Serial No. 73,330. (No model.)

Claim.—1. A burner comprising a stem A, provided with a rotatable valve E, having a ratchet-wheel F, secured thereto, in combination with a bell-crank lever G, insulated from the stem and pivotally supported thereon at a distance from the valve, one arm of the lever being provided with a pawl adapted to engage the ratchet F, and the other arm adapted in its movement to contact with the stem near the igniting-point, an electric circuit, the stem and lever being electrically connected to make and break the circuit as the lever is oscillated.

2. A burner comprising a stem A, provided with a rotatable valve E, constructed with alternate ports and walls, and having a ratchet-wheel F secured thereto, provided with teeth corresponding in number with the number of ports and walls, in combination with a bell-crank lever G, insulated from the stem and pivotally supported thereon at a distance from the valve, one arm of the lever being provided with a pawl arranged to engage the ratchet F, and the other arm adapted in its movement to contact with the stem near the igniting-point, an electric circuit, the stem and lever being electrically connected to make and break the circuit as the lever is oscillated.

704,746. AUTOMATIC LOCKING MECHANISM FOR SIDEWALK OR OTHER ELEVATOR DOORS. PETER H. JACKSON, San Francisco, Cal. Filed Feb. 3, 1902. Serial No. 92,344. (No model.)



Claim.—1. In an elevator-well or the like, hinged doors and devices by which they are opened and closed in unison with the movements of the elevator-platform, oppositely-slidable bolts carried by one of the doors, a hollow sleeve having an annular guide-flange around its periphery, and a channel in which said flange is turnable to prevent end motion, diagonal slot-and-pin connections between the bolts and sleeve and means whereby the sleeve is turned in one direction when the doors are opened to withdraw the locking-bolts and allow it to turn in the opposite direction when the doors are closed to project the bolts and lock the doors.

2. The combination with bolts guided and slidable in line upon the edge of an elevator-hatchway door, of a guided revolubly sleeve of larger interior diameter than that of the bolts having diagonal slots through the periphery and into which the adjacent ends of the bolts extend, pins projecting from the bolts into said slots, a weighted arm projecting from the side of the sleeve, a bail carried by the elevator adapted to contact with said arm and turn the sleeve when the elevator rises whereby the bolts are drawn toward each other, said weight acting to revolve the sleeve in the opposite direction after the elevator has descended and the door is closed whereby the bolts are moved outwardly and the doors locked.

3. The combination with bolts slidable in guides upon a hatchway-door, of a sleeve into which the contiguous ends of the bolts enter, said sleeve having an interior diameter greater than that of the bolts, and inturned flanges at the ends forming bearings on which the sleeve is supported, a weight projecting from the side of the sleeve, means carried by the elevator-platform and adapted to turn the sleeve, said sleeve and bolts having pin-and-slot connections whereby the turning of the sleeve advances or retracts the bolts.

4. The combination with slidable bolts, and a turnable sleeve into which the ends of the bolts enter, said bolts and sleeve having pin-and-slot connections, of a weight projecting from one side of the sleeve, one or more supplemental weights loosely pivoted thereto, and stops by which the swing of said weights is limited.

5. An elevator-hatchway having doors hinged at opposite sides to close centrally, bolts guided and slidable parallel with and contiguous to the edge of one of the doors, a hollow sleeve into the ends of which the adjacent ends of the two bolts extend forming two members, said bolts and sleeve having pin-and-slot connections, an annular flange projecting around the periphery of the sleeve, lugs or channels upon the door between which said flange is guided and turnable, a weight fixed to and projecting from the sleeve at right angles with its axis of rotation, a supplemental weight projecting from the outer end of the first-named weight and turnable loosely with relation thereto, and stops by which the turning movement is arrested, and the weight caused to stand at an angle when the doors are opened.

704,747. FERTILIZER-DISTRIBUTER. CHARLES JOHNSON and OREN C. RAWLEY, Newark Valley, N. Y. Filed Feb. 20, 1902. Serial No. 94,966. (No model.)

Claim.—1. In a fertilizer-distributer, the combination with a wagon-body, of an endless feed-belt, an adjustable tail-gate, a distributing-drum in proximity to said tail-gate, means for rotating said drum, an eccentric mounted on the axle-shaft, a pivoted lever connected with said eccentric, and means connected with said lever for imparting rotation to said endless belt, substantially as described.

2. In a fertilizer-distributer, the combination with a wagon-body, of an endless feed-belt, an adjustable tail-gate, a distributing-drum in proximity to said tail-gate, means for rotating said drum, an eccentric mounted on the axle-shaft, a pivoted lever connected with said eccentric, a reciprocatory bar, connected to said lever for imparting rotation to said endless belt, substantially as described.

3. In a fertilizer-distributer, the combination with a wagon-body, of an endless feed-belt, a distributing-drum, means for rotating said drum, an eccentric mounted on the axle-shaft, a pivoted lever connected with said eccentric, a reciprocatory bar connected to said lever for imparting movement to said endless belt, and means controlled by the driver at his seat for limiting the movement of said reciprocatory bar whereby to regulate the speed of said endless belt, substantially as described.

4. In a fertilizer-distributer, the combination with a wagon-body, of rollers journaled in said wagon-body and an endless belt traveling around said rollers, a distributing-drum, a sprocket mounted on the axle-shaft and a chain connection between said sprocket, and a sprocket on said drum, an eccentric also mounted on said axle-shaft, a pivoted slotted lever connected with said eccentric, a reciprocatory bar having a lug engaging in said slot in said lever, and spring-constrained pawls carried by said re-

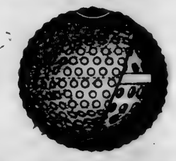
eipreentary bar for engaging a ratchet-wheel on the shaft of one of the rollers carrying the endless belt whereby to impart rotation to said rollers and thence to the endless belt, substantially as described.

5. In a fertilizer-distributer, the combination with a wagon-body, of the curved end-gate working in curved guides in the sides of the wagon-body, means for securing the end-gate in its adjusted position, the endless feed-belt, means for regulating the speed thereof, and the distributing-drum substantially as and for the purpose specified.

6. In a fertilizer-distributer, the combination with a wagon-body, rollers carrying an endless belt journaled in said body, a distributing-drum adjacent to the delivery of said endless belt, a sprocket mounted on the axle-shaft of said wagon, and a sprocket-chain passing around said sprocket and a sprocket on said distributing-drum, an eccentric also mounted on said axle-shaft, a strap on said eccentric, a slotted lever pivoted to the wagon-body and to said eccentric-strap, a reciprocatory bar having a lug engaging in said slot in said lever, pawls pivoted on said bar for rotating a ratchet-wheel on the shaft of one of the said rollers carrying the endless belt, a disk pivoted to said wagon having a strap connected with said reciprocatory bar, and a toothed periphery and a rack for rotating said disk whereby to limit the throw of said reciprocatory rod, and thereby the speed of said endless belt, substantially as described.

7. In a fertilizer-distributer, the combination with a suitable wagon, of an endless traveling belt, an eccentric mounted on an axle-shaft of said wagon, a slotted link pivoted to said eccentric, a reciprocating rod, one end of which is adapted to work in said slot, a ratchet-wheel secured at the other end of said rod, pawls pivoted to said rod and engaging opposite sides of said ratchet-wheel, a spring for holding said pawls in engagement with said ratchet-wheel, means for changing the throw of said rod, and means whereby rotation of the ratchet-wheel imparts movement to the belt.

704,748. PLAYING-BALL. REMBER KNEFFMALL, Boston, Mass. Filed Apr. 23, 1902. Serial No. 104,313. (No model.)



Claim.—1. A hollow playing-ball consisting entirely of two thin shells, whereof the inner shell is of hard, springy material, and the outer is thicker than the inner and consists of hard, plastic material reinforced by fibrous material; said inner shell having perforations through which the material of the outer shell protrudes.

2. A playing-ball consisting entirely of a thin, springy, perforated metal shell, and a thicker shell thereon formed of hard, springy, plastic material incorporated with fabric.

3. A playing-ball consisting entirely of a thin, springy, perforated metal shell, and a thicker shell thereon formed of hard, springy, plastic material and fabric, the fabric being in the form of a layer between two layers of the plastic material, and the material of the inner plastic layer protruding into the perforations in said metal shell.

4. A hollow playing-ball consisting wholly of two thin shells, whereof the inner is thinner than the outer, and consists of springy metal provided with perforations, said outer shell consisting of a plurality of layers of plastic material and a reinforcing layer of fabric; the material of said outer shell protruding into said perforations.

5. A playing-ball comprising a thin shell of springy metal, said shell being provided throughout with perforations, and a hard springy cover for said shell; said cover consisting of plastic material and fabric.

6. A playing-ball comprising a thin shell of metal provided with perforations, and a shell of celluloid and fabric composted upon said shell, portions of the celluloid protruding into said perforations.

7. A playing-ball comprising a complete shell having perforations, and a shell thereon consisting of segments of plastic material and fabric, said segments being welded together at their edges; portions of the plastic material entering said perforations and locking said shells together.

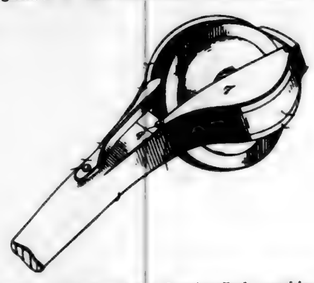
8. A playing-ball comprising a shell having barbs and a shell formed of joined segments, each consisting of plastic material and fabric; said barbs being embedded in said plastic material and preventing separation of said segments.

9. A playing-ball comprising a thin perforated metal shell having barbs, and a shell formed of welded segments of plastic material and fabric; said barbs being embedded in said plastic material, and preventing separation of said segments.

10. A playing-ball comprising a thin metal shell having struck-up barbs, and a shell formed of welded segments of plastic material and fabric; said barbs penetrating and preventing separation of said segments.

11. A playing-ball comprising a shell having barbs, and a shell formed of joined segments of plastic material and fabric; said barbs being embedded in said plastic material; the barbs in one hemisphere pointing toward those in the other hemisphere, thereby to clench said segments together.

704,749. TROLLEY-POLE ATTACHMENT. CHARLES P. LAPHAM, Houghton, N. Y. Filed Feb. 7, 1902. Serial No. 93,084. (No model.)



Claim.—1. A device of the class described comprising a frame or holder having an opening enlarged at the sides to form bearing-recesses and flared at the ends, upper and lower plates secured to the top and bottom of the frame or holder and provided with openings flared at the ends to conform to the configuration of the adjacent portions of the said opening, bearing-blocks arranged in the said recesses and located between the upper and lower plates, said bearing-blocks being capable of a limited oscillation, and a trolley-wheel arranged between and mounted on the blocks, substantially as described.

2. A device of the class described comprising a frame or holder having an opening enlarged at its sides to form bearing-recesses and flared at its ends, upper and lower plates arranged at the top and bottom of the frame or holder and coöperating with the same to form a casing and having longitudinal openings flared at the ends, bearing blocks or segments arranged in the said recesses between the upper and lower plates and provided at their inner faces with bearing-sockets, and a trolley-wheel provided at opposite sides with journals arranged in the said sockets and carried by the bearing blocks or segments, substantially as described.

3. A device of the class described comprising a frame or holder having an opening enlarged at opposite sides to form bearing-recesses, upper and lower plates mounted on the frame or holder and covering the recesses, bearing blocks or segments mounted in the recesses of the frame or holder and provided at their inner faces with bearing-sockets, and a trolley-wheel provided at opposite sides with journals fitting in the said bearing-sockets, substantially as described.

4. A device of the class described comprising a frame or holder, a grooved trolley-wheel mounted thereon and capable of a limited oscillatory movement, and a spring having a reduced intermediate portion and provided with a tapered head extending into the groove of the trolley-wheel and adapted to hold the latter normally in alinement with the trolley-wheel, substantially as described.

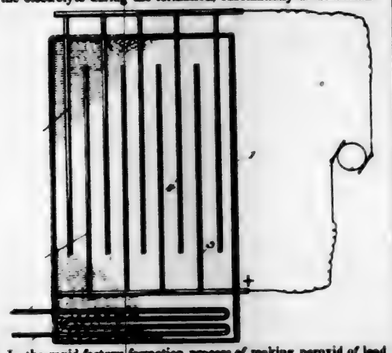
704,750. TANK FOR STORAGE BATTERIES. HUGH LESLEY, Philadelphia, Pa., assignor to the Electric Storage Battery Company, Philadelphia, Pa., a Corporation of New Jersey. Filed Feb. 8, 1902. Serial No. 93,118. (No model.)

Claim.—1. A lead-lined storage-battery tank having openings in its bottom which do not penetrate the lead lining, substantially as described.

2. A lead-lined storage-battery tank having channels between it and its lining and having an apertured bottom, substantially as described.

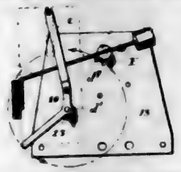
704,751. MANUFACTURE OF SECONDARY-BATTERY PLATES OF THE PLANTÉ TYPE. HAROLD M. MARSH, Philadelphia, Pa., assignor to the Electric Storage Battery Company, Philadelphia, Pa., a Corporation of New Jersey. Filed July 30, 1901. Serial No. 70,268. (No model.)

Claim.—1. In the rapid factory-formation process of making peroxid of lead on battery-plates which consists in subjecting the plates to an electrolyte capable of producing the rapid formation of peroxid from metallic lead, that improvement which consists in controlling the temperature of the electrolyte during the formation, substantially as described.



2. In the rapid factory-formation process of making peroxid of lead on storage-battery plates which consists in subjecting the plates to electrolytic action in an electrolyte capable of producing the rapid formation of peroxid from metallic lead, that improvement which consists in maintaining the electrolyte during the formation below 115° Fahrenheit by abstracting heat from it, substantially as described.

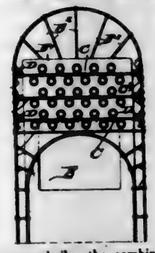
704,752. AUTOMATIC VENDING-MACHINE. SIGMUND MAYER, Chicago, Ill. Filed Oct. 1, 1901. Serial No. 77,195. (No model.)



Claim.—1. In a vending-machine, the combination with mechanism for delivering articles to be dispensed, and a motor for imparting movement to said mechanism and for effecting the delivery of said articles, of coin-controlled mechanism for controlling the operation of said motor, said mechanism comprising a coin-shifted lever, and means whereby the coin will be held, and a revoluble arm connected directly with and shifted by the motor, and positioned to sweep over and engage a coin on said lever to remove said coin from said lever when said arm is shifted by said motor.

2. In a vending-machine, the combination with mechanism for delivering the articles to be dispensed, said mechanism comprising an ejector, and a motor, of an arm shifted by said motor, a pitman connecting said ejector and said arm, a pivotally-sustained lever, provided with a pocket for holding a coin, an arm connected directly with and shifted by the motor, and positioned to sweep the coin from said pocket, a motor-brake operated by said lever, and an operating-shaft whereto both of said arms are directly secured.

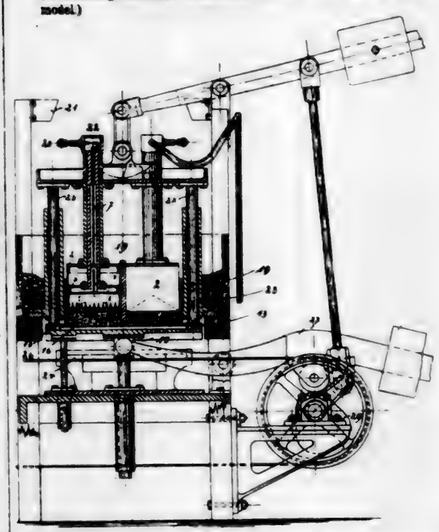
704,753. STEAM-BOILER. GIDEON D. MILLER, Tub, Pa. Filed Nov. 23, 1901. Serial No. 83,490. (No model.)



Claim.—1. In a steam-boiler, the combination of a boiler, having one end terminating in a fire-box, stay-plates connecting the sides of the boiler, the said plates having their opposite ends bent downwardly to form short flanges, and angle-plates having one edge held to the plate, the opposite end being arranged for engagement with the sides of the boiler, substantially as shown and described.

2. In a steam-boiler, the combination of a boiler having one end terminating in a fire-box, tubes arranged in the boiler, angle-plates arranged upon the inner surface of the casing and adjacent the tubes, plates interposed between the tubes and having their ends connected to the said angle-plates, and stay-bolts connecting the inner shell of the fire-box and the casing of the boiler, substantially as described.

704,754. MACHINE FOR MOLDING BRICKS. JULIUS MOHR, Brandenburg, Germany. Filed May 7, 1901. Serial No. 59,191. (No model.)



Claim.—1. In machines for molding bricks, the combination of a mold with a plunger, a webbing situated on the lower surface of said plunger, a frame provided with several ribs situated behind said webbing, a second plunger arranged within the first one also provided with several ribs, said ribs being adapted to fit between the ribs of the first plunger, as and for the purpose set forth.

2. In machines for molding bricks, the combination of a mold with a plunger, a webbing situated on the lower surface of said plunger, a frame provided with several ribs situated behind said webbing, a second plunger arranged within the first one also provided with several ribs, said ribs being adapted to fit between the ribs of the first plunger, and means for loading air and water to the webbing, as and for the purpose set forth.

3. In machines for molding bricks, the combination of a mold with a plunger, a webbing situated on the lower surface of said plunger, a frame provided with several ribs situated behind said webbing, a second plunger arranged within the first one also provided with several ribs, said ribs being adapted to fit between the ribs of the first plunger, and means for loading air and water to the webbing, said means consisting of two plates provided with perforations, as and for the purpose set forth.

4. In machines for molding bricks, the combination of a mold and a plunger for discharging the bricks from said mold with a molding-table movable upward and downward, said molding-table being provided with slide-rails for taking up the brick-boards, and with sliding springs for preventing the boards from being pushed too far, slides for pushing the brick-boards forward and transmitting the same to a traveling cloth and a traveling cloth for transmitting the bricks to the drying-sheds, as and for the purpose set forth.

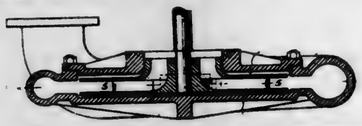
704,755. AUTOMATIC SHUTTER-SETTING MECHANISM. GEORG OETE, Jena, Germany, assignor to The Firm Carl Zeiss, Jena, Germany. Filed Jan. 15, 1901. Serial No. 43,427. (No model.)

Claim.—1. The combination with a safety-shutter, of a mainspring, means for winding up this spring, a pawl-and-ratchet mechanism enabling the mainspring to be released and caught again after only a partial unwinding movement, a release member connected with the shutter

so as to move therewith and adapted to act on the release-pawl of the mainspring, when the shutter has done its exposure work, and a tappet device, which transmits the action of the mainspring to the shutter so as to set the same, essentially as described.

2. The combination with a safety-shutter of a mainspring, means for winding up this spring, a pawl-and-ratchet mechanism enabling the mainspring to be released and caught again after only a partial unwinding movement, a release member connected with the shutter so as to move therewith and adapted to act on the release-pawl of the mainspring, when the shutter has done its exposure work, a tappet device, which transmits the action of the mainspring to the shutter so as to set the same, a mechanism for changing the photographic surface and a connection between this mechanism and the mainspring securing the change of the said surface during each unwinding movement of the mainspring.

704,756. CENTRIFUGAL-PUMP RUNNER. FREDERICK RAY, San Francisco, Cal., assignor of one-half to James Speirs, Jr., San Francisco, Cal. Filed Aug. 3, 1901. Serial No. 70,729. (No model.)



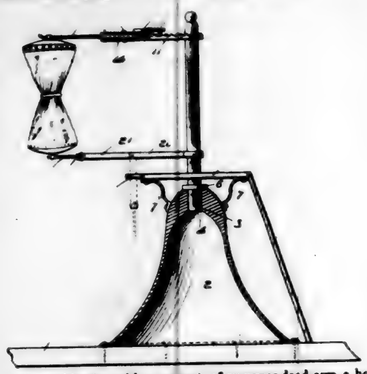
Claim.—1. The combination in a centrifugal pump of a runner composed of separated disks having a diameter approximately that of the interior of the casing within which they revolve and radial vanes fixed between said disks, said vanes being shorter than the distance from the center to the periphery of the disks.

2. The combination in a centrifugal pump of a casing with suction and discharge passages, a closed runner revolvable within said casing, said runner consisting of radial vanes of less peripheral diameter than the interior of the casing, and disks fixed in parallel planes upon each side of the vanes, said disks having a diameter equal to the interior diameter of the casing less clearance.

704,757. DEVICE FOR DELIVERING MAIL-POUCHES TO RAILWAY-CARS. JAMES W. REYNOLDS, Jacksonville, Fla. Filed Jan. 14, 1902. Serial No. 89,644. (No model.)

Claim.—1. In combination with a suitable support, of a pair of vertically-adjustable dead arms arranged one above the other, a horizontally-swinging live arm carried by the upper dead arm, and a vertically-swinging live arm carried by the lower dead arm.

2. In combination with a suitable support, of an upper dead arm, a horizontally-swinging disk carrying an arm mounted in said dead arm, means for holding the same to either side carried by the dead arm, and a lower dead arm carrying a vertically-swinging live arm.



3. In combination with a support, of an upper dead arm, a horizontally-swinging live arm carried thereby, and a lower dead arm, having a vertically-swinging live arm, said live arm having a laterally-swinging trip-lever to engage the pouch.

4. In combination with a suitable support, of an upper dead arm, a horizontally-swinging disk carrying an arm mounted in said dead arm, means for holding the same to either side carried by the dead arm, a lower dead arm, a vertically-swinging live arm carried by said lower dead arm, and a laterally-swinging trip-lever carried by said lower live arm.

5. In combination with a bell-shaped base and a vertical post, of a pair of vertically-adjustable dead arms arranged one above the other, a horizontally-swinging live arm carried by the upper dead arm, and a vertically-swinging live arm carried by the lower dead arm.

6. In combination with a bell-shaped base and a vertical post, of an upper dead arm mounted on the post, a horizontally-swinging disk carrying an arm mounted in said dead arm, means for holding the same to either side carried by the dead arm, a lower dead arm mounted upon the post, and a vertically-swinging live arm carried by said lower dead arm.

7. In combination with a bell-shaped base and a vertical post, of an upper dead arm, a horizontally-swinging live arm carried thereby, a lower dead arm mounted on the post, a vertically-swinging live arm carried by the lower dead arm, and a laterally-swinging trip-lever carried by said lower live arm.

8. In combination with a bell-shaped base and a vertical post, of an upper dead arm, a horizontally-swinging disk carrying an arm mounted in said dead arm, means for holding the same to either side carried by the dead arm, a lower dead arm, a vertically-swinging live arm carried by said lower dead arm, and a laterally-swinging trip-lever carried by said lower live arm.

9. In combination with a bell-shaped base, a vertical post mounted therein, a platform surrounding said post, and brackets to secure the platform to the base and brace the post, of vertically-adjustable dead arms mounted upon said post, and swinging live arms carried by said dead arms for holding and delivering the mail-pouch.

10. In combination with a bell-shaped base, a vertical post mounted therein, a platform surrounding said post, and brackets to secure the platform to the base and brace the post, of a pair of vertically-adjustable dead arms arranged one above the other on the post, a horizontally-swinging live arm carried by the upper dead arm, and a vertically-swinging live arm carried by the lower dead arm.

11. In combination with a bell-shaped base, a vertical post mounted therein, a platform surrounding said post, and brackets to secure the platform to the base and brace the post, of an upper dead arm mounted on the post, a horizontally-swinging disk carrying an arm mounted in said dead arm, a lower dead arm mounted upon the post, and a vertically-swinging arm carried by said lower dead arm.

12. In combination with a bell-shaped base, a vertical post mounted therein, a platform surrounding the post, and brackets to secure the platform to the base and brace the post, of an upper dead arm mounted on the post, a horizontally-swinging live arm carried thereby, a lower dead arm mounted on the post, a vertically-swinging live arm carried by the lower dead arm, and a laterally-swinging trip-lever carried by said lower arm.

13. In combination with a bell-shaped base, a vertical post mounted therein, a platform surrounding said post, and brackets to secure the platform to the base and brace the post, of an upper dead arm mounted on the post, a horizontally-swinging disk carrying an arm mounted in said dead arm, a lower dead arm, a vertically-swinging live arm carried by said lower dead arm, and a laterally-swinging trip-lever carried by said lower live arm.

14. In combination with a bell-shaped base, a vertical post mounted therein, a platform surrounding said base, means to connect the platform and base and brace the post, and a spring-catch carried upon the forward part of the platform, of an upper dead arm carried by said post, a swinging live arm connected thereto, spring-catches for holding the live arm out of use, a lower dead arm mounted on the post, and a swinging live arm carried by the lower dead arm and adapted to be engaged by the spring-catch of the platform when the live arm is out of use.

704,758. PROCESS OF STERILIZING AND PRESERVING COCAINE. WILLIAM C. RILEY, San Francisco, Cal. Filed Mar. 2, 1901. Serial No. 49,580. (No specimens.)

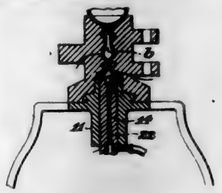
Claim.—1. The method of preparing and preserving cocaine, consisting in placing the dried cocaine in the vial or container; plugging the mouth of the vial or container with dry absorbent material, gradually heating for about fifteen (15) minutes or until the heat reaches approximately 145° centigrade; removing the absorbent plugs; and, finally, hermetically sealing the mouth of the vial or container.

2. The method of preparing and preserving cocaine consisting, essentially, in placing dry cocaine in a receptacle and plugging the mouth of the receptacle with dry sterilized absorbent material; then gradually heating the receptacle to a temperature approximating 145° centigrade (the absorbent plugs taking up any moisture, and preventing condensation in the receptacle;) then removing the absorbent material; and finally, hermetically sealing the receptacle.

704,759. STORAGE-BATTERY SEPARATOR. HUGH RODMAN, Philadelphia, Pa., assignor to the Electric Storage Battery Company, Philadelphia, Pa., a Corporation of New Jersey. Filed July 29, 1901. Serial No. 70,092. (No model.)

Claim.—In a secondary or storage battery the combination with the plates thereof of an imperforate wooden diaphragm between each pair of plates said diaphragm having acid-wells on both sides thereof, said wells substantially vertical and open to afford free circulation between each plate and the diaphragm in vertical direction.

704,760. MANUFACTURE OF GLASSWARE. HENRY SCHAUB, Mount Pleasant, Pa., assignor to Bryce Brothers Company, Mount Pleasant, Pa., a Corporation of Pennsylvania. Filed Feb. 1, 1902. Serial No. 92,185. (No specimens.)



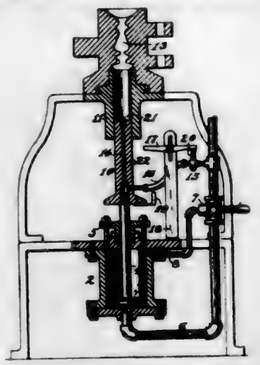
Claim.—1. The improvement in the manufacture of hollow-stemmed articles of glassware, which consists in blowing a body or bowl, forming a stem by pressing glass against the body or bowl, and blowing a longitudinal cavity in the stem.

2. The improvement in the manufacture of hollow-stemmed articles of glassware which consists in blowing a body or bowl, forming an integral stem and foot by pressing glass against the body or bowl, and blowing a longitudinal cavity in the stem.

3. The improvement in the manufacture of hollow-stemmed articles of glassware which consists in blowing a body or bowl, applying the body or bowl to the opening of a press-mold, forming a stem by pressing glass in the mold against the body or bowl, and blowing a longitudinal cavity in the stem.

4. The improvement in the manufacture of hollow-stemmed articles of glassware which consists in blowing a body or bowl, applying the body or bowl to the opening of a press-mold, forming an integral stem and foot by pressing glass in the mold against the body or bowl and blowing a longitudinal cavity in the stem.

704,761. APPARATUS FOR THE MANUFACTURE OF GLASSWARE. HENRY SCHAUB, Mount Pleasant, Pa., assignor to Bryce Brothers Company, Mount Pleasant, Pa., a Corporation of Pennsylvania. Filed Apr. 29, 1902. Serial No. 106,218. (No model.)



Claim.—1. In an apparatus for the manufacture of glassware, the combination of a fluid-pressure cylinder, a piston and rod working therein, a pressing-plunger connected with the piston-rod, a cylinder in which said plunger reciprocates, a partible press-mold communicating with said cylinder, and means for admitting an air-blast to the press-mold.

2. In an apparatus for the manufacture of glassware, the combination of a fluid-pressure cylinder, a piston and rod working therein, a pressing-plunger connected with the piston-rod, a cylinder in which said plunger reciprocates, a partible press-mold communicating with said cylinder, means for admitting an air-blast to the press-mold, and means for controlling the admission of the air-blast by the traverse of the plunger.

3. In an apparatus for the manufacture of glassware, the combination of a fluid-pressure cylinder, a piston and rod working therein, a pressing-plunger connected with the piston-rod, a cylinder in which said plunger reciprocates, a partible press-mold communicating with said cylinder, a passage extending through the plunger, a flexible air-supply conduit leading into said passage, an automatically-operating valve controlling communication between said conduit and the press-mold, an air-supply valve controlling the air-supply conduit, a valve-lever adapted to open said supply-valve, and a tappet fixed to the plunger, in position to actuate the valve-lever.

4. In an apparatus for the manufacture of glassware, the combination of a fluid-pressure cylinder, a piston and rod working therein, a pressing-plunger connected with the piston-rod and having a longitudinal air-passage, a cylinder in which said plunger reciprocates, a partible press-mold communicating with said cylinder, an automatically-operative valve seating in the air-passage of the plunger and controlling communication between said passage and the press-mold, a flexible air-supply conduit leading into said passage, an air-supply valve controlling said conduit, a valve-lever adapted to operate said supply-valve, and a tappet fixed to the plunger in position to actuate the valve-lever.

704,762. GAS AND AIR MIXER. JOHN SEYMOUR, Toronto, Canada. Filed Dec. 4, 1901. Serial No. 84,701. (No model.)

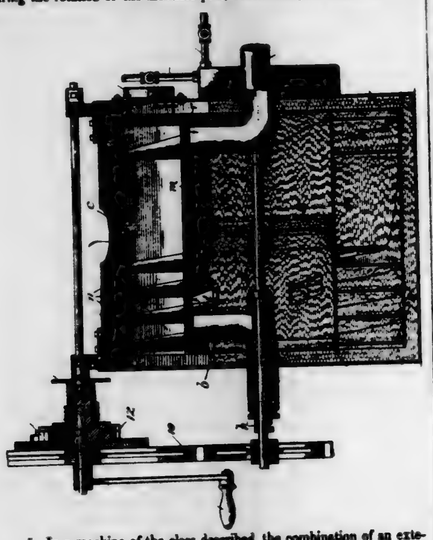
Claim.—1. In a machine of the class described, the combination of an outer casing providing a liquid-sealing chamber, a part rotatably mounted therein provided with a gas-supply chamber and having one or more air-measuring chambers arranged around the periphery of such chamber and through which air is fed for mixing with gas, and means for feeding gas to the machine to mix with the air during the operations of the same, substantially as described.

2. In a machine of the class described, the combination of a receptacle providing a liquid-sealing chamber, a movable part rotatably mounted in such chamber and provided with a gas-supply chamber and with a series of helical air-measuring chambers, and means for feeding gas into such air-measuring chambers to the air as it is measured by such chambers and during the rotation of the movable part, substantially as described.

3. In a machine of the class described, the combination of an outer casing, an inner movable part provided with a mixing-chamber therein an air-measuring chamber in such movable part communicating with such mixing-chamber, and means for feeding gas to the mixing-chamber during the operation of the movable part to thoroughly mix the gas and air, substantially as described.

4. In a machine of the class described, the combination of an exte-

rior casing providing an air-supply and liquid-sealing chamber, a rotatable part movably mounted in such sealing-chamber and provided with an air-measuring chamber or chambers, each of which is provided with a gas-inlet, and means for feeding gas into such air-measuring chambers during the rotation of the movable part, substantially as described.



5. In a machine of the class described, the combination of an exterior casing providing an air-supply and liquid-sealing chamber, an interior rotatable part providing a gas-supply and liquid-sealing chamber on its interior and a series of air-measuring chambers each having an inlet-opening communicating with such gas-supply chamber, means by which such movable part may be rotated, and means for sealing and opening the inlet-openings of the air-measuring chambers as the parts rotate, substantially as described.

6. In a machine of the class described, the combination of an exterior casing providing an air-supply and water-sealing chamber, an interior cylindrical rotatable receptacle providing an axial gas-supply and water chamber and a series of air-measuring chambers, each connected with the interior gas and water chamber and open at one end thereof to the air-supply, means by which such interior part may be rotated, a gas-supply pipe and a mixture-exhaust pipe connected with the interior of the rotatable part, substantially as described.

7. In a machine of the class described, the combination of an exterior receptacle providing an air-supply, and liquid-sealing chamber, an interior cylindrical receptacle providing an axial gas-supply and water chamber at one end and an axial mixture-exhaust chamber at the other end and a plurality of peripheral helical air-measuring chambers communicating with the gas-supply chamber and open at one end to the air-chamber and at the other end to the mixture-exhaust chamber, a gas-supply pipe connected with the gas-supply and water chamber, a mixture-exhaust pipe connected with the exhaust mixture-chamber, and means by which the rotatable receptacle may be operated to mix the air and gas, substantially as described.

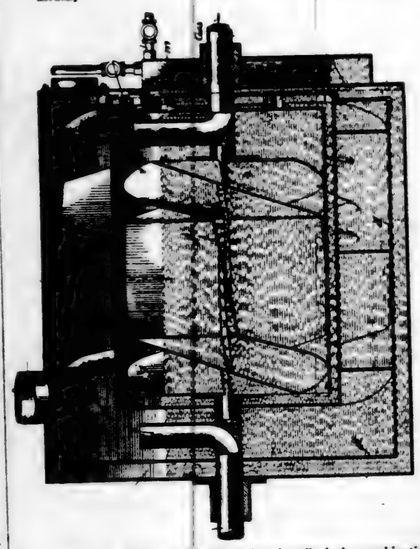
8. In a machine of the class described, the combination of an exterior receptacle providing an air-supply and liquid-sealing chamber, a rotatable cylinder located therein having an inner cylindrical wall providing an axial gas-supply chamber at one end and an axial exhaust-chamber at the other end, an outer cylindrical wall secured to the inner wall, a plurality of helical blades interposed between both of such cylindrical walls and forming a series of helical air-measuring chambers opening at one end into the air-supply chamber and at the other end into the mixture-exhaust chamber, a series of perforations extending through the inner cylindrical wall forming a communication between each of the air-measuring chambers and the gas-supply chamber, a fixed gas-supply pipe entering the gas-supply chamber with its outlet above the liquid seal therein, and a fixed exhaust-pipe entering the mixture-chamber above the liquid seal, substantially as described.

9. In a machine of the class described, the combination of an exterior receptacle providing an air-supply and liquid-sealing chamber, a rotatable cylinder located therein having an inner cylindrical wall providing an axial gas-supply chamber at one end and an axial exhaust-chamber at the other end, an outer cylindrical wall rigidly secured to the inner wall, a plurality of helical blades interposed between both of such cylindrical walls and forming a series of helical air-measuring chambers opening at one end into the air-supply chamber and at the other end into the mixture-exhaust chamber, a series of perforations extending through the inner cylindrical wall forming a communication between each of the air-measuring chambers and the gas-supply chamber, a fixed gas-supply pipe entering the gas-supply chamber with its outlet above the liquid seal therein, a fixed exhaust-pipe entering the mixture-chamber above the liquid seal, a water-box on the walls of the exterior casing communicating with the liquid portion of the chamber and provided with liquid supply and overflow pipes, substantially as described.

10. In a machine of the class described, the combination of an exterior casing providing an air-supply and liquid-sealing chamber, a rotating cylinder mounted therein and provided with axial gas-supply and mixture-exhaust chambers and a series of helical peripheral air-measuring chambers, each communicating with the air-supply gas-supply and mixture and exhaust chambers, a shaft upon which such rotatable cylinder is mounted and by which it is moved extending out through the exterior casing, a supply-pipe for the gas-supply chamber, an exhaust-pipe for the mixture-exhaust chamber, and gear and weight mechanism connected with the rotatable supporting-shaft for the same, substantially as described.

11. In a machine of the class described, the combination of an outer casing provided with an air-inlet opening, an inner rotatable part provided with a mixing-chamber therein, a series of air-measuring chambers in such inner rotatable part each having an inlet-opening communicating with the air-inlet of the outer casing and an outlet-opening communicating with the mixing-chamber in such rotatable part, means for sealing and opening the inlet-openings of the air-measuring chambers, and means for admitting gas to the mixing-chamber, substantially as described.

704,768. MACHINE FOR MIXING GAS AND AIR. JOHN SEYMOUR, Toronto, Canada. Filed Dec. 9, 1901. Serial No. 85,258. (No model.)



Claim.—1. In a machine of the class described, the combination of an outer casing, and two movable parts arranged therein and forming two chambers one within the other—one for measuring air and one for measuring gas, arranged by their coöperation to assist in thoroughly mixing the same, substantially as described.

2. In a machine of the class described, the combination of an outer casing provided with a liquid-sealing chamber, and two movable parts arranged therein and forming two chambers one within the other—one for measuring air and one for measuring gas, arranged by their coöperation to assist in thoroughly mixing the same, means for admitting gas under pressure into the chamber of one of such movable parts to measure such gas and cause such part to rotate, and means for connecting such two movable parts, whereby when one is rotated the other is operated, substantially as described.

3. In a machine of the class described, the combination of a receptacle providing a liquid-sealing chamber, and two concentric rotatable cylinders—one for measuring air and the other for measuring gas and arranged by their coöperation to assist in thoroughly mixing the gas, substantially as described.

4. In a machine of the class described, the combination of an exterior receptacle providing a mixture-exhaust and liquid-sealing chamber, and two interior concentric cylindrical receptacles arranged one within the other and provided with helical measuring-chambers—one for measuring air and the other for measuring gas and arranged by their coöperation to thoroughly mix such gases, substantially as described.

5. In a machine of the class described, the combination of an exterior receptacle providing a mixture-exhaust and liquid-sealing chamber, two concentric cylindrical receptacles provided with peripheral helical measuring-chambers geared together so as to rotate simultaneously to thoroughly mix air and gas during the coöperation of the parts, means for feeding air to the chambers of the exterior cylinder, and means for feeding gas to the chambers of the interior cylinder, substantially as described.

6. In a machine of the class described, the combination of an exterior casing providing a mixture-exhaust and liquid-sealing chamber, an outer cylindrical receptacle provided with a series of substantially helical measuring-chambers for air and communicating at one end with the exhaust-chamber, a concentric inner cylinder provided with a series of helical measuring-chambers open at one end to the exhaust-chamber, gear mechanism connecting both cylinders together, means for feeding gas to the inner cylinder to rotate the same and by which it is measured, and means for feeding air to the other or outer cylinder, the parts being arranged to coöperate and mix the two gases together, substantially as described.

7. In a machine of the class described, the combination of an exterior casing provided with a mixture-exhaust and liquid-sealing chamber, an outer cylinder having one closed end formed of two concentric walls between the ends of which is arranged an air and liquid sealing chamber and between the concentric walls of which is arranged a series of helical air-measuring chambers opening into the exhaust-chamber, an inner concentric cylinder provided with an outer cylindrical wall and closed at one end to form a gas-supply chamber and provided with a plurality of helical blades forming a series of helical measuring-chambers, a fixed pipe entering the air and liquid chamber above the liquid seal of the outer cylinder upon which one end of both cylinders is rotatably mounted, a fixed pipe entering the gas-supply chamber of the inner cylinder upon which the other end of the inner cylinder is loosely and rotatably mounted, and an exhaust-pipe for the exhaust-chamber of the outer receptacle substantially as described.

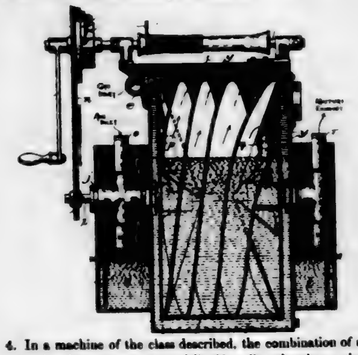
8. In a machine of the class described, the combination of an exterior casing provided with a mixture-exhaust and liquid-sealing chamber, an outer cylinder having one closed end and two concentric walls between the ends of which is arranged an air and liquid-sealing chamber and between the concentric walls of which is arranged a series of helical air-measuring chambers opening into the exhaust-chamber, an inner concentric cylinder provided with an outer cylindrical wall and closed at one end to form a gas-supply chamber and provided with a plurality of helical blades forming a series of helical measuring-chambers, a fixed pipe entering the air and liquid chamber above the liquid seal of the outer cylinder upon which one end of both cylinders is rotatably mounted, a fixed pipe entering the gas-supply chamber of the inner cylinder upon which the other end of the inner cylinder is loosely and rotatably mounted, an exhaust-pipe for the exhaust-chamber of the outer receptacle, a liquid-supply box secured to the main receptacle and having communication with the liquid-sealing portion thereof, and supply and overflow pipes on such box, substantially as described.

704,764. AIR AND GAS MIXER. JOHN SEYMOUR, Toronto, Canada. Filed Apr. 19, 1902. Serial No. 103,703. (No model.)

Claim.—1. In a machine of the class described, the combination of an outer casing forming a liquid-sealing chamber, a rotatable drum therein provided with a plurality of helical supply and mixing chambers arranged within the same, each provided with an air and a gas inlet, a supply-pipe for such rotatable drum, and a mixture-exhaust pipe for such inner drum, substantially as described.

2. In a machine of the class described, the combination of an exterior receptacle providing a fluid-supply and liquid-sealing chamber, a closed cylindrical drum rotatably mounted therein and provided with a plurality of fluid supply and mixing chambers connected with the fluid-supply chamber of the interior receptacle and each having an air-inlet, an axial fluid-supply pipe at one end of such chamber, and an axial mixture-exhaust pipe at the other end of each chamber, substantially as described.

3. In a machine of the class described, the combination of an exterior casing forming a gas-supply and liquid-sealing chamber, a closed cylinder rotatably mounted therein and provided with a plurality of perforations and a plurality of helical supply and mixing chambers therein, each chamber arranged to be connected by means of the perforations in the walls of the cylinder with the gas-supply chamber of the exterior receptacle, an axial air-supply pipe at one end of such rotatable cylinder communicating with the chambers therein, and an axial exhaust-pipe at the other end of such rotatable cylinder communicating with the other end of the chambers, substantially as described.



4. In a machine of the class described, the combination of an exterior casing forming a gas-supply and liquid-sealing chamber, a closed cylinder rotatably mounted therein provided with a multiplicity of perforations in the walls thereof, a plurality of helical blades mounted in the interior of such rotatable cylinder providing a plurality of air-supply and mixing chambers, each arranged opposite perforations in the wall of the cylinder to communicate with the gas-supply chamber of the exterior receptacle, a shaft upon which the blades and rotatable cylinder are mounted and rotated, an air-supply pipe communicating with the helical chambers of the rotatable cylinder above the water seal, and a mixture-exhaust pipe communicating with the helical chambers above the water seal, substantially as described.

5. In a machine of the class described, the combination of an exterior casing forming an air-supply and liquid-sealing chamber, a closed cylinder rotatably mounted therein and provided with perforations in the walls thereof, a plurality of helical blades arranged in such rotatable cylinder and at varying angles to form a plurality of helical air-supply and mixing chambers of increased size in cross-section at the discharge ends thereof and communicating by means of the perforations with the gas-supply chamber of the exterior receptacle, an axial air-supply pipe communicating with the helical chambers above the water seal at one end thereof, and a mixture-exhaust pipe communicating with the discharge ends of the mixing-chambers above the water seal, substantially as described.

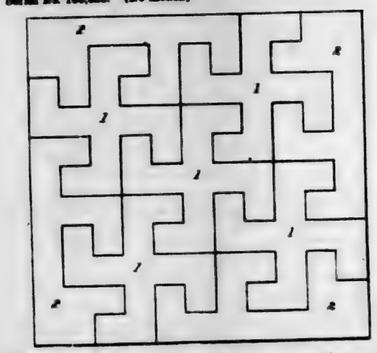
6. In a machine of the class described, the combination of an exterior casing forming a gas-supply and liquid-sealing chamber, a closed cylinder rotatably mounted therein and provided with a plurality of perforations in its wall, a plurality of helical blades arranged in such cylinder at different angles and at different portions of their lengths to form a plurality of air-supply and mixing chambers of increased size in cross-section at their discharge ends and communicating with the gas-supply chamber of the exterior receptacle by means of the perforations in the walls of the cylinder, a shaft upon which such blades and rotatable cylinder are supported and rotated, an air-supply pipe at one end communicating with the helical chambers above the water seal, and a mixture-exhaust pipe at the other end communicating with the discharge end of the helical chambers above the water seal, substantially as described.

7. In a machine of the class described, the combination of an exterior casing forming a gas and liquid-sealing chamber, a rotatable cylinder mounted therein provided with a plurality of helical air-supply and mixing chambers communicating with the gas-supply chamber of the exterior receptacle, an axial air-supply pipe in one end of the cylinder communicating therewith above the water seal, a mixture-exhaust pipe at the other end of the cylinder communicating therewith above the water seal, a drip-box arranged under each of the supply and exhaust pipes and communicating therewith, and siphon overflow-pipes arranged in such drip-boxes, substantially as described.

704,765. CUFF-HOLDER. JOHN F. SMITH and JAMES S. HULL, New York, N. Y.; said Smith assignor to said Hull. Filed Oct. 30, 1901. Serial No. 80,822. (No model.)

Claim.—A fastener comprising a base having a tongue pressed outward therefrom, said base having its end portions bent upward and contracted for a short distance from their extremities to form tongues which are curved toward each other and have shoulders at their bases, toggle-jaws having slots near their outer ends to receive the said curved tongues, and having curved arms near their inner ends overlapped, the arm of one jaw being outermost at one side and an arm of the other jaw being outermost at the opposite side, the ends of the outermost arms being bent outward to form finger-pieces, and a pin pivotally connecting the said arms, substantially as specified.

704,766. TILE. WILL C. STAFF, Akron, Ohio, assignor to the Goodyear Tire and Rubber Company, Akron, Ohio. Filed May 5, 1902. Serial No. 106,025. (No model.)



Claim.—1. An improved tile consisting of a rectangular cross with arms of like size and shape, the length of each arm being twice its width, and turned at a right angle in the same way from the center, at a point distant from the cross-arm equal to its width and for a like distance, substantially as shown and described.

2. An improved tiling consisting of blocks in form of a rectangular cross with arms of like size and shape, each arm being turned at a right angle at the same distance from the cross-arm, and for the same length, in combination with border-tile, each having one straight edge with a square corner, the other end and edge having a configuration to fit the adjacent inner tile, substantially as shown and described.

3. An improved corner and border tile for inner filling-tile in form of rectangular crosses with arms of like size and shape each turned at a right angle at the same distance from the cross-arm and for the same length; which consists of tile having a straight edge and end at a right angle, with the inner edge conformed to match and interlock with the adjacent arms of inner tile, substantially as shown and described.

4. An improved border-tile for inner filling-tile in form of rectangular crosses with arms of like size each turned at a right angle at the same distance from the cross-arm and for the same length; which consists of tile having a straight edge, with the other edge having a configuration to fit the adjacent inner tile, substantially as shown and described.

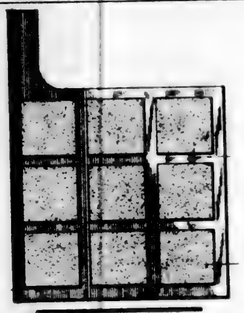
704,767. SECONDARY BATTERY. EDWARD G. STRAUSSER, Philadelphia, Pa., assignor to the Electric Storage Battery Company, Philadelphia, Pa., a Corporation of New Jersey. Filed Sept. 30, 1899. Serial No. 732,068. (No model.)

Claim.—1. Active material or material to become active consisting of a coherent mass of crystallized lead free from blow-holes, the crystals of said mass being interrelated according to their law of crystallization, substantially as described.

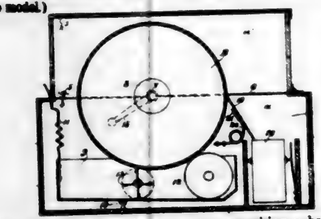
2. The process of producing active material or material to become active which consists in making an amorphous body of lead compound, and subjecting the compound as a cathode to electrolytic action in a bath in which the compound is soluble, thereby changing its structure into the form of a coherent crystalline mass, substantially as described.

3. The process of producing active material or material to become active which consists in making an amorphous body of chlorid of lead, and subjecting the body as a cathode to electrolytic action in a bath in which the chlorid of lead is soluble, thereby changing its structure into the form of a coherent crystalline mass, substantially as described.

704,767.



704,768. REFRIGERATOR, FREEZER, AND CHURN. SAMUEL SWEENEY, San Francisco, Cal. Filed Sept. 9, 1901. Serial No. 74,783. (No model.)



Claim.—1. A refrigerating apparatus comprising a box, a cover therefor, a horizontal partition in said box, an opening in said partition, a revolvable cylinder in said opening, said cylinder projecting into compartments above and below the partition and adapted to contain a freezing mixture, a containing-pan pivotally mounted in the box, a distributing-roller in said pan, and a means whereby said pan is oscillated to bring the roller and cylinder into contact when the cover is closed upon the box.

2. In a refrigerating apparatus, a box having openings at either end, closures for said openings, a hinged cover for said box, a horizontal partition in said box by which two compartments are formed therein when the cover is closed, an opening in said partition, a revolvable cylinder mounted in said opening and so as to occupy a portion of each compartment above and below the partition said cylinder adapted to contain a freezing mixture, and means whereby an article to be frozen may be submitted to the action of said mixture.

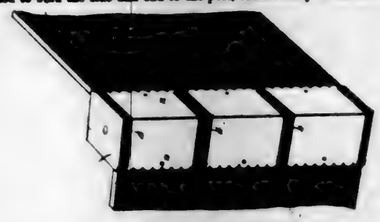
3. A refrigerating apparatus comprising a box, a cover therefor, a revolvable cylinder in said box, a containing-pan pivotally mounted in the box beneath said cylinder, a distributing-roller and an agitator mounted in said pan, a spring extension on the rear of said pan adapted to be engaged by the cover when the latter is closed so as to oscillate the pan and bring the agitator and roller into contact with the cylinder whereby the roller, agitator and cylinder are revolvable in unison.

4. In a refrigerating apparatus, the combination of a box, a revolvable cylinder in said box and adapted to contain a freezing mixture, a containing-pan pivotally mounted beneath said cylinder, a distributing-roller in said pan, a cover for said box and resilient connections between said cover and pan whereby the latter is tilted, when the former is closed, to cause the surfaces of said distributing-roller and cylinder to be brought into contact.

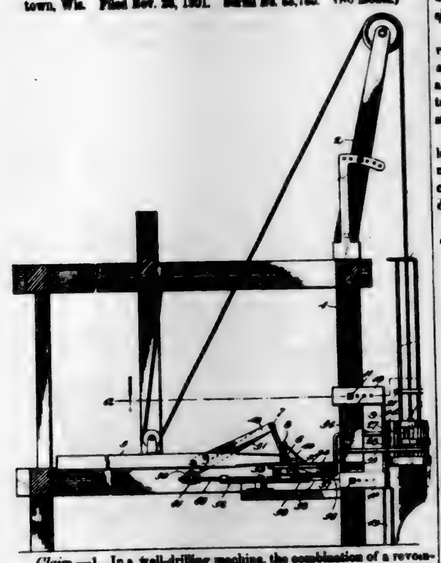
704,769. STAY FOR BUGGY-BEDS. WILLIAM B. WILLIAMSON Malvern, Kans., assignor of one-half to W. R. Myers, Powhattan, Kans. Filed Nov. 2, 1901. Serial No. 80,912. (No model.)

Claim.—1. In a device of the class described, the combination with a vehicle-body having a corner-post, of a stay comprising exterior sides arranged at right angles to each other to fit the corner of the vehicle-body and extending from the top to the bottom of the same and provided with exterior bracing devices formed integral with the sides, the inwardly-extending integral rectangular top and bottom plates entirely covering the space between the sides and connecting the latter and arranged on the corner-post and beneath the bottom of the sill of the vehicle-body and provided with perforations, and vertical fastening devices passing through the perforations and embedded in the corner-post, substantially as described.

2. In a device of the class described, the combination with a vehicle-body having a corner-post, of a stay comprising the vertically-disposed exterior sides conforming to the configuration of the corner of the vehicle-body and extending from the top to the bottom of the same and provided with integral exterior bracing devices extending across the sides, the inwardly-extending integral top and bottom plates arranged in the same plane as the corner-post, and fastening devices passing through the top and bottom plates and embedded in the post, whereby the stay is adapted to bind the side and end to the post, substantially as described.



704,770. WELL-DRILLING MACHINE. MICHAEL WILLIAMS, Madison, Wis., assignor of one-third to William J. Schneider, Middletown, Wis. Filed Nov. 26, 1901. Serial No. 83,795. (No model.)



Claim.—1. In a well-drilling machine, the combination of a revolvable drill-rope guide having two series of reversely-disposed ratchet-teeth, one of said series being above the other, with pawls to engage said ratchet-teeth respectively, said pawls being disposed on opposite sides of said guide, means to operate said pawls, a shiftable support for said pawls and means to automatically operate said shiftable support and thereby successively engage the said pawls, to rotate said drill-rope guide alternately in reverse directions, substantially as described.

2. In a well-drilling machine, the combination of a revolvable drill-rope guide having two series of reversely-disposed ratchet-teeth, with pawls to engage said ratchet-teeth respectively, means to operate said pawls, means to successively shift them into engagement with the respective teeth of said drill-rope guide, and a brake for said drill-rope guide, substantially as described.

3. In a well-drilling machine, the combination of a revolvable drill-rope guide having two series of reversely-disposed ratchet-teeth, with pawls to engage said ratchet-teeth respectively, a pivoted support for said pawls, said pivoted support having a tappet, means to impart longitudinal motion to said pawls, a cam coacting with said tappet to shift said pivoted support and thereby shift the said pawls into engagement alternately with the ratchet-teeth of said drill-rope guide, and means to operate said cam, substantially as described.

4. In a well-drilling machine, the combination of a revolvable drill-rope guide having two series of reversely-disposed ratchet-teeth, pawls to engage said ratchet-teeth respectively, a lever to operate the drill-rope, a connection between said lever and said pawls whereby the latter are operated to rotate said drill-rope guide, a shiftable element connected to said pawls to successively shift them into engagement with the respective teeth of said drill-rope guide and means, including a step-by-step movement, operatively connected to said lever, to shift said shiftable element, substantially as described.

5. In a well-drilling machine, the combination of a revolvable drill-rope guide having two series of reversely-disposed ratchet-teeth with pawls to engage said ratchet-teeth respectively, a lever to operate the drill-rope, a connection between said pawls and said lever whereby said pawls are moved longitudinally, a shiftable element connected to said pawls to successively engage them with the respective teeth of said drill-rope guide, and a connection including a step-by-step mechanism between said shiftable element and said lever, to actuate said shiftable element, substantially as described.

6. In a well-drilling machine, the combination of a revolvable drill-rope guide having two series of reversely-disposed ratchet-teeth, pawls to engage said ratchet-teeth respectively, a drill-rope-operating lever, a rock-shaft, a lever 50 connected to the said pawls to move the latter longitudinally, a connection between said lever 50 and the rock-shaft, an operating connection between the latter and said drill-rope lever, whereby said rock-shaft is operated, a shiftable element connected to the pawls to successively shift them into engagement with the respective teeth of the drill-rope guide and a step-by-step mechanism actuated by said rock-shaft to operate said shiftable element, substantially as described.

7. In a well-drilling machine, the combination of a mast for the direction-sheave of the drill-rope, a support connected to the said mast and adjustable toward and from the same, a bearing carried by said support, a revolvable drill-rope guide journaled in said bearing and adjustable means to rotate the said drill-rope guide alternately in reverse directions, substantially as described.

8. In a well-drilling machine, the combination of a mast, a revolvable drill-rope guide, a bearing therefor, adjustable toward and from the mast, a drill-rope-operating lever and an adjustable element, operatively connected to said lever for rotating said drill-rope guide, substantially as described.

704,771. FIREPROOF BUILDING. THOMAS BAILEY, New York, N. Y. Filed June 22, 1901. Serial No. 65,541. (No model.)

Claim.—1. The improved dovetail corrugated sheet-metal building-sheets, having exterior rounded ribs and interior flat ribs with contracted interior plaster-holding grooves and wider exterior grooves, the wide ribs being flat on the top both outwardly and inwardly with acute angles at the junctions of the top and the sides, and the narrow grooves being rounded on the top both outwardly and inwardly and at the junctions with the sides.

2. The combination with the dovetail corrugated sheet-metal building-sheets having exterior rounded ribs and interior flat ribs with contracted interior plaster-holding grooves and wider exterior grooves, the wide ribs being flat on the top both outwardly and inwardly with acute angles at the junctions of the top and the sides, and the narrow grooves being rounded on the top both outwardly and inwardly and at the junctions with the sides, of hooks for securing bars to the flat ribs, each having a head insertible edgewise in the narrow interior plaster-holding grooves and securable therein by the broader flatwise dimensions set transversely to the groove in the adjustment of the hook after being inserted, for engaging the bar.

3. The combination with the dovetail corrugated sheet-metal building-sheets, having exterior rounded ribs, interior flat ribs and contracted interior plaster-holding grooves, of reinforcing-rods inserted in the plaster-holding grooves.

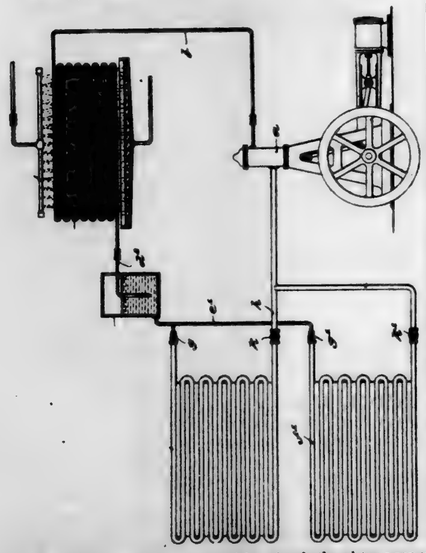
4. The combination with the dovetail corrugated sheet-metal building-sheets having exterior rounded ribs, interior flat ribs and interior contracted plaster-holding grooves, of the lateral stiffening-bars, and retaining-hooks therefor detachably secured in the plaster-retaining grooves and securing said stiffening-bars on the flat ribs.

5. The combination with the dovetail corrugated sheet-metal building-sheets having exterior rounded ribs, interior flat ribs and contracted interior plaster-holding grooves, of reinforcing-rods inserted in the plaster-retaining grooves, lateral stiffening-bars and retaining-hooks for said bars detachably secured in the plaster-retaining grooves.

6. The combination with the dovetail corrugated sheet-metal building-sheets having exterior ribs, interior flat ribs and contracted interior plaster-retaining grooves, of the lateral stiffening-bars and retaining-hooks for said bars, said hooks having disk heads insertible edgewise in the plaster-retaining grooves, and securable therein crosswise, and in the crosswise position securing the bars.

7. The combination with the dovetail corrugated sheet-metal building-sheets having exterior ribs and interior contracted plaster-holding grooves, of lateral stiffening-bars and retaining-hooks for securing said bars to the sheets, said hooks having a head insertible edgewise in the groove, but interlocking when turned sidewise, and a prong adapted to engage the bars when so turned, and the plaster fixing said bars and hooks in position.

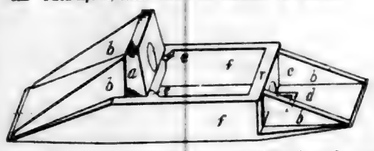
704,772. **MANUFACTURING ARTIFICIAL ICE.** EDWARD BARRATT, Philadelphia, Pa., assignor of two-thirds to John J. Keller and Augustus Bettney, Philadelphia, Pa. Filed Dec. 6, 1901. Serial No. 84,865. (No model.)



Claim.—1. In the manufacture of ice wherein the plate or pan is supplied with refrigerating liquid which expands in the plate or pan to cool the same, the method of releasing the ice from the plate or pan which consists in first preventing the expansion of the liquid in the plate or pan and thereafter continuing to supply to the plate or pan the liquid refrigerant whereby the pressure of the refrigerant liquid is gradually increased within the plate or pan and a gradual increase of the temperature of the plate or pan is secured.

2. In the manufacture of artificial ice, wherein a series of coils are supplied with the refrigerating liquid, said liquid being permitted to expand in said coils, the method of releasing the previously-formed ice from said coils, which consists in cutting out the required coil from the return to the pump which exhausts the refrigerant from the coil and maintaining the supply of liquid to the coil from the receiver or tank to thereby increase gradually the pressure of refrigerant liquid in the coil.

704,773. **TANK-HOOP LUG.** ALBERT J. BEHRENS, San Francisco, Cal. Filed Apr. 9, 1902. Serial No. 102,143. (No model.)

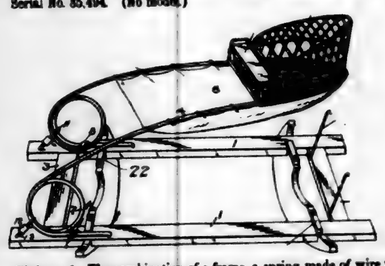


Claim.—1. The combination, in a tank-hoop lug, of a movable washer having a lip designed to fit beneath a projection on the body of the shoe and an opening to receive the threaded end of the hoop-rod, with a shoe having an opening to receive the hoop-rod and a projection designed to fit over a lip on the washer, all as described and for the purposes specified.

2. The combination, in a tank-hoop lug, of a movable washer having grooves designed to fit wings on the shoe and an opening designed to receive the threaded end of the hoop-rod, with a shoe having wings designed to fit grooves in the washer and having an opening designed to receive the hoop-rod, all as described and for the purposes specified.

3. The combination, in a tank-hoop lug, of a washer having its two faces at an angle with each other and having grooves designed to fit wings on the shoe and a lip designed to fit beneath a projection on the shoe, with a shoe having wings and a projection designed to fit grooves and a lip respectively on the washer and having an opening designed to receive the hoop-rod, all as described and for the purposes specified.

704,774. **COMBINED CRADLE AND BABY-JUMPER.** JOHN W. BLACKLEDGE, Chicago, Ill. Filed Mar. 8, 1900. Renewed Dec. 11, 1901. Serial No. 85,494. (No model.)



Claim.—1. The combination of a frame, a spring made of wire with the ends secured flatly on the frame then coiled and extended backward so as to be substantially horizontal when under strain, hooks that are caught over the coils and secured to the frame with their length adjustable whereby the resiliency of the spring may be regulated, and a child-support on the free end of the spring.

2. The combination of a frame, a spring secured at one end thereto with two arms or sides extending backward so as to be substantially horizontal when under strain, a seat detachably secured on the free end of the spring, and a hammock secured between the spring-arms.

3. The combination of a frame, rockers upon which the frame is detachably mounted, a spring made of wire secured at one end to said frame and extending backward so as to be substantially horizontal when under strain, a hammock suspended between the arms of said spring, and links connecting the free end of the spring and the frame whereby the spring is rendered stationary.

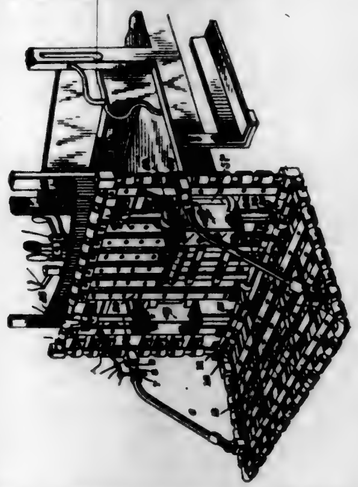
704,775. **SAD-IRON.** EWALD BLECHMANN, Seyenburg, Germany. Filed Mar. 6, 1902. Serial No. 96,910. (No model.)

Claim.—1. The combination, with a sad-iron having a projection on its top, said projection having similarly-disposed locking-lips, of a handle having a hollow base, a transverse locking-bolt mounted in said base, said locking-bolt being adapted to pass in one position between said locking-lips and to engage therewith in another position and means for operating said locking-bolt, substantially as set forth.

2. The combination, with a sad-iron having a projection at its upper part provided with a transverse recess, of a detachable handle provided with a hollow base, said base extending over the projection on the sad-iron, a transverse locking-bolt of segmental cross-section turning in said hollow base, and an exterior crank-handle attached to one end of said bolt and adapted to turn it on its axis for locking the handle to or detaching it from the sad-iron, substantially as set forth.

3. The combination, with a sad-iron provided with a segmental projection on its top part, said projection having a transverse recess, of a handle, a hollow base attached to the lower part of said handle, a transverse segmental bolt turning in said base, an exterior crank-handle attached to one end of the locking-bolt, and an exterior angular recess in the side wall of the hollow base adapted for limiting the movement of the handle and bolt, substantially as set forth.

704,776. **CAR-FENDER.** ELI A. BOOKER, Altoona, Pa. Filed Feb. 10, 1902. Serial No. 93,249. (No model.)



Claim.—1. In a car-fender, the combination with the car, of a fender comprising a lower frame and a vertical frame, a series of hinged doors carried by said frames, vertical shafts carried by the vertical frame, bearings carried by the bottom of the car, means for operating the fender in a vertical direction, means carried by the vertical frame and extending into the bearings, and means for operating said means whereby one or both sides of the fender may be extended outwardly, substantially as described.

2. In a car-fender, the combination with a car, of a vertical and a lower frame carried thereby, means for raising said fender in a vertical direction, means for returning said fender to its normal vertical position, and means secured to each side of the vertical frame for causing the same to move outwardly, substantially as described.

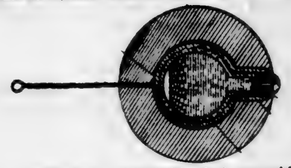
3. In a car-fender, the combination with a vertical frame and a lower frame pivotally mounted thereon, a rack-bar carried by said vertical frame, bearings carried by the bottom of the car and in which said rack-bars operate, said rack-bars being spring-pressed, and means for operating said rack-bars to cause the fender to move outwardly from the car, substantially as described.

4. In a car-fender, the combination with a car, of a fender comprising a vertical frame having a lower frame pivotally mounted thereon, a series of hinged doors carried by the said members of the fender, a spring-pressed connection formed between the said fender and the under face of the car, and means for operating said connection whereby the fender may be operated in a vertical direction, substantially as described.

5. In a car-fender, the combination with a car having a fender comprising a lower and a vertical frame secured thereto, of casings having guide-rollers mounted therein, a vertical frame carrying vertical shafts operating between said guide-rollers, the lower end of the vertical frame having rearwardly-extending spring-pressed rack-bars connected thereto, said rack-bars operating in bearings carried by the bottom of the car, and means for operating said rack-bars whereby the fender is moved in the outward position, substantially as described.

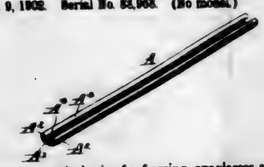
6. In a car-fender, the combination with a car having a vertical frame and a lower frame connected thereto, of casings having guide-rollers mounted therein connected to the vertical frame, hinged doors carried by the lower frame whereby the same may be swung backwardly to receive the said casings when the fender is in a folded position, a spring-pressed connection between the fender and the bottom of the car, means for operating said connection so as to cause the fender to move in a vertical direction, and means for actuating the fender in an outward direction from either one or both sides thereof, substantially as described.

704,777. **DISINFECTING DEVICE.** EDWARD L. BRIGGS, St. Louis, Mo. Filed Dec. 4, 1901. Serial No. 84,627. (No model.)



Claim.—A disinfecting and deodorizing device comprising a porous bottle; a neck formed integral with said bottle; a hanger formed by twisting a wire around said neck and around said bottle and extending from the bottle as required to suspend the bottle with the neck depending downwardly, said hanger also serving as a handle in filling the bottle; and a covering cast around said bottle with the neck extending through the covering, said hanger also extending through the covering.

704,778. **OPTICAL WIRE.** DANIEL V. BROWN, Philadelphia, Pa. Filed Jan. 9, 1902. Serial No. 88,968. (No model.)



Claim.—1. An optical wire for framing eyeglasses and spectacles consisting of a thin metal plate having its central portion transversely curved into a trough-like section and its lateral edges curved inward toward the bottom of the central trough-like section to form a channel or groove of truncated-V shape between the elastic tongues formed by the said edges of the curved plate.

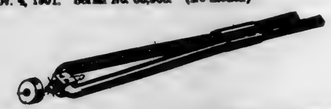
2. An optical wire for framing eyeglasses and spectacles consisting of a thin metal plate transversely curved to form a broad convex lower curve A' and relatively sharper lateral curves at A^2 A^2 with inwardly and downwardly extending edges A^3 A^3 forming a channel or groove bounded by the elastic edges of the curved plate.

704,779. **MOISTENING-MACHINE.** PEARL C. CRAWFORD, Salem, Ohio. Filed Apr. 5, 1902. Serial No. 101,627. (No model.)

Claim.—In a moistener, the combination of a liquid-receptacle having seats formed on its upper edges and shoulders formed by the seats, a semicylindrical casing seated in said seats and bearing against said shoul-

ders, with openings formed in said casing, a sleeve carrying a brush, a shaft mounted in said casing and receiving said sleeve with means for securing the sleeve to the shaft, one end of the shaft projecting without the casing and bent to form a crank whereby the brush may be rotated, the bristles of the brush bearing outwardly against the interior of the casing, whereby they may project through the casing when the brush is rotated, substantially as described.

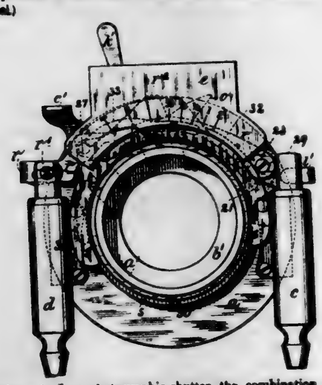
704,780. ATOMIZER. ALLEN DE VILBISS, Toledo, Ohio. Filed Nov. 4, 1901. Serial No. 80,963. (No model.)



Claim.—1. In an atomizer, a head having two of its opposite sides formed with chambers therein, a pair of arms which enter and engage said chambers, a chambered cap adapted to engage said head and having a central orifice therethrough, a nozzle-point projecting into said orifice and connected with one of the chambers of said head, and connections between the other chamber of the head and the chamber of the cap.

2. In an atomizer, a head having two chambers therein, one of which has an air-supply connection, the other of which has a liquid-supply connection, a chambered cap detachably secured upon said head and having a central aperture, a spraying-point upon said head which enters said aperture and which has an axial passage connected with one of the chambers in said head, and connections between the chamber of the cap and the other chamber of the head.

704,781. PHOTOGRAPHIC SHUTTER. GILBERT S. DEY, Rochester, N. Y., assignor to the Gundlach Optical Company, Rochester, N. Y., a Corporation of New York. Filed July 30, 1900. Serial No. 25,210. (Model.)



Claim.—1. In a photographic shutter, the combination with a device for actuating the shutter-blades and by which the same may be set without opening or moving the blades, of a cam-ring adjustable to the several positions of time, bulb and instantaneous, and means actuated thereby for controlling the mechanism actuating the shutter-blades, substantially as set forth.

2. In a photographic shutter, the combination with a device for actuating the shutter-blades and by which the said blades may be set without being moved, of a cam-ring adjustable to the several positions of time, bulb and instantaneous, devices placed intermediate of the hereinbefore-stated devices, the position of which is altered by the movement of the adjustable device, and a release-lever acting in connection with said intermediate devices, substantially as set forth.

3. In a photographic shutter, a device actuating the shutter-blades and by which they may be set without being moved, and which device is constructed to insure a full-open movement of the shutter-blades, in combination with an adjustable cam-ring adapted to be moved to the various positions of time, bulb and instantaneous, a release-lever operated by bulb-pressure and parts acting in connection therewith and the movement of which is controlled by the said annular adjustable device for controlling the said exposure, substantially as set forth.

4. In a photographic shutter, the combination with a spring-actuated operating-lever for moving the shutter-blades and by which the same may be set without being moved, of a release-lever, a lever pivoted to the release-lever, a lever pivoted to the case and acting in connection with the release-lever, and an adjustable cam-ring adapted to be set to the positions of time, bulb and instantaneous, whereby the aforesaid levers, independent of the release-lever, are actuated for controlling the various exposures, substantially as set forth.

5. In a photographic shutter, a spring-actuated operating-lever having a cam-slot with opposite inclined portions and an appreciable intermediate portion connecting the approaching ends of the inclined portions, substantially as set forth.

6. In a photographic shutter, a spring-actuated operating-lever having a cam-slot with opposite inclined portions and an appreciable intermediate portion connecting the approaching ends of the inclined portions and having a groove in the back face of said operating-lever connecting the extreme ends of said slot and which groove is varying in its depth and deepest adjacent to the end of said cam-slot and free end of said lever, substantially as and for the purposes set forth.

7. In a photographic shutter, a spring-actuated operating-lever having a cam-slot with opposite inclined portions and an appreciable intermediate portion connecting the approaching ends of the inclined portions and having a groove in the back face of said operating-lever connecting the extreme ends of said slot and which groove is varying in its depth and deepest adjacent to the end of the cam-slot and free end of said lever and a yoke-lever and a pin projecting from the yoke-lever and passing through the slot of the operating-lever, substantially as and for the purposes set forth.

8. In a photographic shutter, the combination with the back of the case and the shutter-blades and pivots for the said blades, of plates pivoted to the pivots of the shutter-blades and coming between the blades and the case and having upturned ends passing through holes in the shutter-blades, and means for engaging the upturned ends to operate the shutter-blades, substantially as set forth.

9. In a photographic shutter, the combination with the back of the case and the shutter-blades and pivots for the said blades, of plates pivoted to the pivots of the shutter-blades and coming between the blades and the case, and having upturned ends passing through holes in the shutter-blades, and a yoke-lever having slots for the pivots of the shutter-blades and for the upturned ends of the said plates, and means for engaging and moving the said yoke-lever for effecting the movements of the shutter-blades, substantially as set forth.

10. In a photographic shutter, the combination with the back of the case and the shutter-blades and pivots for the said blades, of plates pivoted to the pivots of the shutter-blades and coming between the blades and the case and having upturned ends passing through holes in the shutter-blades, a yoke-lever having slots for the pivots of the shutter-blades and for the upturned ends of the said plates, and a pin 13 projecting from one surface thereof and an operating-lever pivoted to the back of the case and spring-actuated and having a slot with opposite inclines and an intermediate portion approximately flat and concentric with the pivot of the said operating-lever, and through which slot the pin of the yoke-lever passes and a groove in the back of the operating-lever for the said pin to pass through in setting the operating-lever, substantially as set forth.

11. In a photographic shutter, the combination with the shutter-blades, means for moving the same and the operating-lever for engaging the said means and actuating the shutter, of a stop-pin 9 connected to and projecting from the said operating-lever, a release-lever and a bulb-lever pivoted to the case, a time-lever pivoted to the release-lever, springs for actuating the release and bulb levers and means substantially as specified, for controlling the respective positions of the bulb and time levers for effecting the movements of the shutter, substantially as set forth.

12. In a photographic shutter, the combination with the shutter-blades, means for moving the same and the operating-lever for engaging the said means and actuating the shutter, of a stop-pin 9 and a time-pin 10 connected to and projecting from the said operating-lever, a release-lever and a bulb-lever pivoted to the case, a time-lever pivoted to the release-lever, springs for actuating the release and bulb levers, and means substantially as specified for controlling the respective positions of the bulb and time levers for effecting the movements of the shutter, substantially as set forth.

13. In a photographic shutter, the combination with the shutter-blades, means for moving the same and the operating-lever for engaging the said means and actuating the shutter, of a stop-pin 9 and a time-pin 10 connected to and projecting from the said operating-lever, a release-lever pivoted to the case and having an end engaging the piston of the air-cylinder, a spring for drawing down said lever and a tooth projecting from the under surface of the lever and adapted to engage the said pin 9 and hold the shutter in a set position, a bulb-lever pivoted to the case and having a spring causing the same to move upward and having a hook at its free end to engage the said pin 9, substantially as set forth.

14. In a photographic shutter, the combination with the shutter-blades, means for moving the same and the operating-lever for engaging the said means and actuating the shutter, of a stop-pin 9 connected to and projecting from the said operating-lever, a release-lever pivoted to the case and connected to the dash-pot, a dash-pot lever pivoted to the case and having an end engaging the piston of the air-cylinder, a spring for drawing down said lever and a tooth projecting from the under surface of the lever and adapted to engage the said pin 9, and hold the shutter in a set position, a bulb-lever pivoted to the case and having a spring causing the same to move upward and having a notch at its free end to engage the said pin 9, and a time-lever pivoted to the release-lever and having a toothed end adapted to come into engagement with the said pin 9, and means substantially as set forth for moving the said time-lever in its relation to the release-lever so as to project or retract the said toothed end, substantially as set forth.

15. In a photographic shutter, the combination with means for actuating the shutter-blades, of a release-lever *l* pivoted to the case and having an end *l'* adapted to engage and be operated by the piston of the air-cylinder, a spring 17 for drawing down the release-lever, a tooth 18 integral with the said release-lever and projecting into the path of the shutter-blade-operating devices for engaging the same and locking the said blades in a set position, a bulb-lever in the same place as the release-lever, a pivot for connecting the same to the case, and a spring for moving the said bulb-lever upward, the said bulb-lever having a notch 22 at its free end and a projecting pin 21 at its other end, a time-lever pivoted to the release-lever, a pin connected to one end of the time-lever and having a tooth projection at its other end, and a cam-ring adapted to engage the pins of the bulb-lever and time-lever to hold the bulb-lever in a fixed position independent of the release-lever, and for moving the time-lever in its relation to the release-lever for the various exposures of the shutter, substantially as set forth.

16. In a photographic shutter, the combination with the shutter-blades and means, including an operating-lever, for actuating the same, of a time-pin 10 on the operating-lever, a dash-pot, a dash-pot lever pivoted to the case and connected to the dash-pot, a lifting-lever pivoted to the dash-pot lever, a projecting pin upon the lifting-lever, and means substantially as set forth for swinging the lifting-lever on its pivot and progressively elevating and holding the same in a predetermined position, whereby with the movement of the operating-lever the pin 10 engages the lifting-lever elevating the dash-pot lever for the various graduated predetermined time exposures, substantially as set forth.

17. In a photographic shutter, the combination with the shutter-blades and means, including an operating-lever, for actuating the same, of a time-pin 10 on the operating-lever, a dash-pot, a dash-pot lever pivoted to the case and connected to the dash-pot, a lifting-lever pivoted to the dash-pot lever, a projecting pin upon the lifting-lever, and an annular device adjustable to the various graduated predetermined time exposures, having a slot receiving the pin of the lifting-lever and adapted to progressively change the position thereof, substantially as and for the purposes set forth.

18. In a photographic shutter, the combination with the front case *a* of devices for actuating the shutter-blades, a pin 9 connected therewith and means for limiting the movement of the pin, devices connected to the back of the front case *a* and between the same and the shutter-actuating devices for engaging the pin of said devices, and means upon the front of the case *a* for effecting the position of the intermediate devices and controlling the exposures of the shutter, substantially as set forth.

19. In a photographic shutter, the combination with the front and back parts of the case, the shutter-blade-actuating devices connected to the back part of the case and the controlling devices connected to the front part of the case, of a hood above and extending over the parts of the case and covering some of the actuating devices and having on its face graduations for the time, bulb and instantaneous exposures and the graduated predetermined time exposures, substantially as set forth.

20. In a photographic shutter, the combination with the case and the barrel, of a cam-ring surrounding the barrel and rotatable thereon, and a ring upon the barrel for holding the said cam-ring in place, said cam-ring having a cam-slot 31 and cam edge 32 forming part of the cam-ring, and devices actuated thereby with the turning of the cam-ring for controlling the shutter-operating mechanism, substantially as set forth.

21. In a photographic shutter, the combination with the case and the barrel, of a cam-ring surrounding the barrel and rotatable thereon, and a ring upon the barrrel for holding the said cam-ring in place, said cam-ring having a cam-slot 31 and cam edge 32 and a cam-slot 33 forming part of the cam-ring and devices actuated thereby with the turning of the cam-ring for controlling the shutter-operating mechanism, substantially as set forth.

22. In a photographic shutter in which no head mechanism is employed, a device embracing in itself means for instantly opening and for instantly closing the shutter-blades and for intermediately holding the same open for a predetermined length of time, means for actuating such device, separate and independent means for controlling the length of time of the exposure and an annular rotatable device having a single pointer and acting upon the exposure mechanism and independent of the time mechanism, substantially as set forth.

23. In a photographic shutter in which no head mechanism is employed, a device embracing in itself means for instantly opening and for instantly closing the shutter-blades and for intermediately holding the same open for a predetermined length of time, means for actuating such device, separate and independent means for controlling the length of time of the exposure and an annular rotatable device having a single pointer and acting upon the exposure mechanism and independent of the time mechanism, substantially as set forth.

24. In a photographic shutter, the combination with a pneumatic dash-pot, of a dash-pot lever connected thereto and pivoted to the case, a spring for actuating the dash-pot lever, and a lip projection rising from and integral with the dash-pot lever, and a pin connected to the shutter-blade-operating devices coming against the lip projection of the dash-pot lever, substantially as and for the purposes set forth.

25. In a photographic shutter, the combination with a pneumatic dash-pot, of a dash-pot lever connected thereto and pivoted to the case, a spring for actuating the dash-pot lever, and a lip projection rising from and integral with the dash-pot lever, and a pin connected to the shutter-blade-operating devices coming against the lip projection of the dash-pot lever, and a device connected to the dash-pot lever, and means for altering the relation of the said device to the dash-pot lever whereby the position of the dash-pot lever and its downward movement are regulated and controlled to govern the exposure, substantially as set forth.

26. In a photographic shutter, the combination with the shutter-blade-operating mechanism, of a release-lever, a tooth projecting therefrom and adapted to engage a moving part of the shutter mechanism to hold the shutter set, a bulb-lever adapted to also engage the said moving part of the shutter mechanism, the parts being so constructed that the said bulb-lever is thrown out of the path of the said moving part of the shutter mechanism by the return of the release-lever to its normal position, substantially as set forth.

27. In a photographic shutter, the combination with the shutter-blade-operating mechanism, of a release-lever, a tooth projecting therefrom and adapted to engage a moving part of the shutter mechanism to hold the shutter set, a bulb-lever adapted to also engage the said moving part of the shutter mechanism, the parts being so constructed that the said bulb-lever is thrown out of the path of the said moving part of the shutter mechanism by the return movement of the release-lever to its normal position, and a second lip connected to the release-lever, and means for throwing the same in or out of the path of the moving part of the shutter-operating mechanism, substantially as set forth.

28. In a photographic shutter, the combination with the shutter-blade-operating mechanism, of mechanism for effecting the time, bulb and instantaneous exposures, an annular device surrounding the lens-barrel and to which a circular forward-and-backward movement may be imparted by hand, and means connected to said annular device for engaging the devices for effecting the time, bulb and instantaneous movements and controlling the same, substantially as specified.

29. In a photographic shutter, the combination with the shutter-blade-operating mechanism, of mechanism for effecting the time, bulb and instantaneous exposures and also the graduated predetermined time exposures, an annular device to which a forward-and-backward movement may be imparted around the lens-barrel, and means connected to said annular device for engaging the devices for effecting the time, bulb and instantaneous exposures and also the graduated, predetermined time exposures and controlling the same, substantially as set forth.

30. In a photographic shutter, the combination with the shutter-blades, and means for moving the same, of an operating-lever for moving the said exposure mechanism, the said operating-lever having a slot composed of three parts, that is, an upwardly-inclined portion, a downwardly-inclined portion and an intermediate portion formed substantially straight and upon the arc of a circle from the pivotal point of the said operating-lever, substantially as set forth.

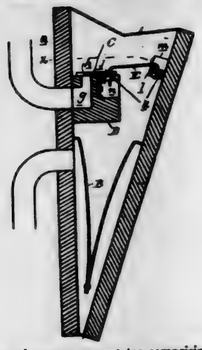
31. In a photographic shutter, the combination with the shutter-blades, and means for moving the same, of an operating-lever for moving the said exposure mechanism, the said operating-lever having a slot composed of three parts or members, that is, an upwardly-inclined portion, a downwardly-inclined portion and an intermediate portion formed substantially straight and upon the arc of a circle from the pivotal point of the said operating-lever, and the extreme ends of the inclined portions of the slot connected by a groove in the back surface of the lever of varying depth providing for the return movement and the engagement by the device upon the shutter mechanism engaged by the operating-lever, substantially as set forth.

32. In a photographic shutter, the combination with spring-actuated operating and release levers and the parts connected thereby, of an independent finger-lever *c'* centrally pivoted at the back of and extending across the case and having a tail end coming beneath the end of the re-

lease-lever, and devices for limiting the movements thereof, whereby the parts may be operated by hand if desired, substantially as specified.

33. In a photographic shutter the combination with a spring-actuated operating-lever and a pin 10 thereon, of a dash-pot lever having a rising projection and lifting-lever pivoted together and means for determining the position of the lifting-lever whereby the pin 10 in the movement of the operating-lever comes against the lifting-lever and raises the dash-pot lever and the dash-pot lever arrests the movement of the operating-lever substantially as specified.

704,782. AIR-PRESSURE REGULATOR. JOSEPH H. DICKINSON, Detroit, Mich. Filed June 26, 1901. Serial No. 66,966. (No model.)



Claim.—1. An air-pressure regulator comprising a collapsible bellows having an elongated exhaust-port, a valve pivoted at one end adjacent to said port and a connection between the opposite end of said valve and the movable wall of the bellows adapted to cause the gradual closing of said port by the collapsing of the bellows.

2. An air-pressure regulator comprising collapsible bellows, a block arranged within said bellows and connected to the fixed wall thereof, said block having an elongated port therein, a valve resting upon said block and pivoted thereto at one end in such a position as to gradually open or close said elongated port, and a link directly connecting the other end of said valve with the movable wall of said bellows.

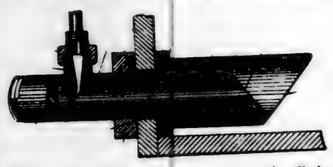
704,783. METALLIC RAILROAD-TIE AND FASTENER. WILLIAM S. DODD, Washington, Pa. Filed Dec. 3, 1901. Serial No. 84,511. (No model.)

Claim.—In a steel tie and fastener, a tie formed of a channel-bar, the upper portion of said tie having its ends extended and carrying lugs, said ends being turned up at right angles to the upper portion and having the lugs extending through openings provided therefor in the sides of the said channel-bar, a bar for said channel-bar carrying lugs on its ends and sides, said lugs adapted to be passed through openings provided therefor in the sides and ends of the channel-bars and secured to the latter, braces located within said channel-bar and carrying lugs extending through the upper portion and the sides thereof, said upper portion having a struck-up portion for engagement with the rail-base, and fastening means extending through the upper portion of the tie and secured thereto for engagement with the opposite side of the rail-base, substantially as described.

704,784. TRACK-SANDING APPARATUS. JOHN J. DOLAN, Jr., Baltimore, Md. Filed Apr. 26, 1902. Serial No. 104,788. (No model.)

Claim.—1. In a track-sanding apparatus, the combination with a sand-box having a discharge-opening, of a tubular casing detachably secured to the sand-box at said discharge-opening and provided with a fluid-pressure nozzle; and a shield provided with a sleeve extending inwardly from said discharge-opening, whereby said casing may be detached from the sand-box without danger of wasting the sand from the same, as set forth.

2. In a track-sanding apparatus, the combination with a sand-box having a discharge-opening, of a tubular casing secured in said opening and extending outwardly therefrom and provided with a tubular arm projecting into the sand-box; a nozzle for fluid-pressure adapted to discharge the sand through said arm and casing; and a sleeve surrounding said arm on the inside of the sand-box, as and for the purpose set forth.

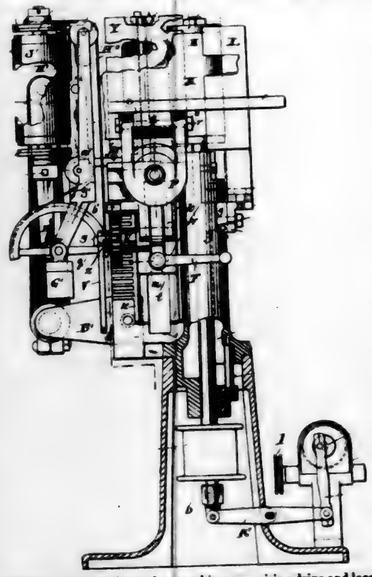


3. The combination of a sand-box provided with a discharge-opening; a shield secured on the inside of the sand-box at said discharge-opening and comprising an inwardly-extending sleeve provided with a downwardly-facing beveled end; and a sand-discharging apparatus provided with a tubular arm mounted in said sleeve, as and for the purpose set forth.

4. In a track-sanding apparatus, a sand-box provided with a discharge-opening, and a shield secured on its inside at said opening and having an inwardly-extending sleeve adapted to receive a sand-discharging tube, as set forth.

5. A track-sanding apparatus, comprising a sand-box provided with a discharge-opening; a tubular casing in said discharge-opening and projecting outwardly therefrom and provided at its outer end with two diverging branches adapted for attachment to sand-tubes intended to lead to the track-rails; and air or steam nozzles extending into said casing and pointing outwardly in the direction of said two branches, as and for the purpose set forth.

704,785. SANDPAPERING-MACHINE. CHARLES H. DRIVER, Racine, Wis. Filed Apr. 10, 1901. Serial No. 55,122. (No model.)



Claim.—1. A sandpapering-machine comprising drive and loose pulleys, an abrading-belt on the pulleys, means for imparting automatic positive reciprocation to the belt, and other means for limiting movement of said belt in both directions of its reciprocation.

2. A sandpapering-machine comprising drive and loose pulleys, an abrading-belt having variable tension arrangement on the pulleys, means for imparting automatic positive reciprocation to the belt, and other means for limiting movement of said belt in both directions of its reciprocation.

3. A sandpapering-machine comprising an abrading-belt, a positively-reciprocative drive-pulley for the belt, and a loose pulley for said belt reciprocative in synchrony with the same under friction thereof independent of the drive-pulley.

4. A sandpapering-machine comprising an abrading-belt, a positively-reciprocative drive-pulley for the belt, and an automatically-oscillative loose pulley for said belt reciprocative in synchrony with the same under friction thereof independent of the drive-pulley.

5. A sandpapering-machine comprising a base, a standard in swivel connection with the base, a pulley fast on a spindle engaging bearings with which the standard is provided, a loose pulley in oscillative connection with said standard, and an abrading-belt on the pulleys.

6. A sandpapering-machine comprising a base, a standard in swivel connection with the base, a pulley fast on a spindle engaging bearings with which the standard is provided, means for reciprocating the spindle, a loose pulley in oscillative connection with the standard, and an abrading-belt on the pulleys.

7. A sandpapering-machine comprising a standard, a bracket in connection with the standard, a yoke in pivotally-adjustable connection with the bracket, and a work-table having under side pivotally-adjustable connection with the yoke branches.

8. A sandpapering-machine comprising a standard, a bracket in vertically-adjustable connection with the standard, a yoke in pivotally-adjustable connection with the bracket, and a work-table having an under side block in like connection with the yoke branches.

9. A sandpapering-machine comprising a standard provided with a vertical rack, a bracket having sliding engagement with the standard, a clamp mechanism for the bracket, a loose pinion carried by said bracket in mesh with the rack portion thereof, a crank having ratchet-clutch connection with a side of the pinion, and a work-table in connection with the aforesaid bracket.

10. A sandpapering-machine comprising an abrading-belt and means for actuating same, a work-table, a pivotally-adjustable bracket, and a work-gage adjustable on the bracket in a direction transverse to the travel of the belt.

11. A sandpapering-machine comprising an abrading-belt, means for actuating same, and a belt-backing adjustable on lines at right angles to each other.

12. A sandpapering-machine comprising a drive-pulley, a pivotal hanger, a loose pulley having its spindle in connection with the hanger, an abrading-belt on the pulleys, and governor mechanism operative in conjunction with the belt and loose-pulley hanger.

13. A sandpapering-machine comprising a drive-pulley, a pivotal hanger, a spindle rigid with the hanger, a loose pulley counterbalanced on said spindle, an abrading-belt on the pulleys, governor mechanism operative in conjunction with said belt and hanger, and means for reciprocating the belt.

14. A sandpapering-machine comprising a drive-pulley, a pivotal hanger, a spindle rigid with the hanger, a pulley and disks of corresponding diameter loose on said spindle, the pulley being intermediate of the disks, an abrading-belt on the pulleys, a frame in pivotally-adjustable connection with the support for said hanger, sheaves carried by the frame, a counterweighted rocker suspended from said frame, in eccentric connection with said hanger, and flexible sheave-opposing runners in connection with said disks and rockers.

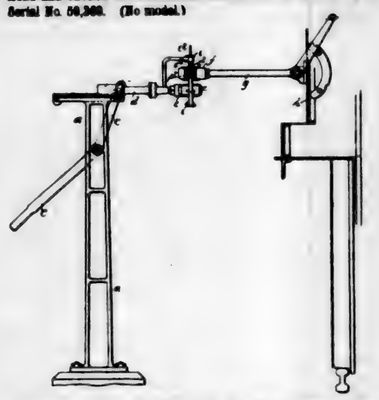
15. In a sandpapering-machine the combination of a drive-pulley, a pivotally-adjustable arm, a hanger in pivotal connection with the arm, a spindle rigid with the hanger, a pulley and disks of corresponding diameter loose on said spindle, the pulley being intermediate of the disks, an abrading-belt on the pulleys, a frame in pivotally-adjustable connection with said arm, sheaves carried by the frame, a counterweighted rocker suspended from said frame in eccentric connection with said hanger, and flexible sheave-opposing runners in connection with said disks and rockers.

16. In a sandpapering-machine, the combination of a drive-pulley, a pivotally-adjustable spring-controlled arm, a hanger in pivotal connection with the arm, a spindle rigid with the hanger, a pulley and disks loose on the spindle, the pulley being intermediate of the disks, an abrading-belt on the pulleys, a frame in pivotally-adjustable connection with said arm, sheaves carried by the frame, a counterweighted rocker suspended from said frame in eccentric connection with said hanger, and flexible sheave-opposing runners in connection with said disks and rockers.

17. A sandpapering-machine, comprising a base, a standard in swivel connection with the base, a spindle having its bearings in the base, means for reciprocating the spindle, a pulley fast on said spindle, a loose pulley having an oscillative hanger, an abrading-belt adjustable as to tension on the pulleys, an adjustable backing for the belt, and a universally-adjustable work-table.

18. A sandpapering-machine comprising a base, a standard in swivel connection with the base, a spindle having its bearings in the base, means for reciprocating the spindle, a pulley fast on said spindle, an oscillative loose pulley, an abrading-belt adjustable as to tension on the pulleys, an adjustable backing for the belt, a universally-adjustable work-table, and an adjustable work-gage.

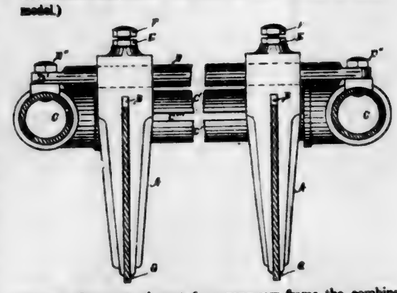
704,786. TABLET PICKING UP AND DEPOSITING APPARATUS FOR USE ON SINGLE LINES OF RAILWAYS. WALTER DRUMMOND and GEORGE W. DRUMMOND, Govan, Scotland. Filed May 9, 1901. Serial No. 59,269. (No model.)



Claim.—1. Tablet picking up and depositing apparatus for use on single lines of railway comprising in combination a tablet-holder consisting of a pair of receiving and a pair of carrying jaws, a lever on a stationary standard located at the side of the line for effecting reciprocal movement of said tablet-holder, a traveling arm located on the cab of the locomotive containing a pair of carrying and a pair of receiving jaws and a hand-lever movable through a quadrant on the locomotive-cab for imparting rotation in a vertical plane to said arm substantially as set forth.

2. Tablet picking up and depositing apparatus for use on single lines of railway comprising in combination a tablet-holder consisting of a pair of receiving and a pair of carrying jaws, a lever on a stationary standard located at the side of the line for effecting reciprocal movement of said tablet-holder, a traveling arm located on the cab of the locomotive and containing a pair of carrying and a pair of receiving jaws pivotally mounted on an axis and stop devices holding said tablet-holder at positions diametrically opposite each other in the direction of motion of the train and a hand-lever movable through a quadrant on the locomotive-cab for imparting rotation to the said arm substantially as set forth.

704,787. GANG-SAW ATTACHMENT. JOSEPH E. DOCHARON, Cottonwood Falls, Kans. Filed Oct. 26, 1900. Serial No. 34,458. (No model.)

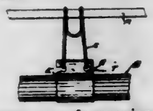


Claim.—In an attachment for a gang-saw frame the combination with the frame, a series of threaded holes in the upper sides of the side bars as shown, the cap-screws D″, D″; the round cross-bar D adjustably attached to said frame C by said cap-screws D″, D″, and said threaded holes C″, C″; a series of dogs or clamps A, A, each being of a single piece of cast iron or steel, and having round holes to fit onto said round bar D, and slots to receive the saws, and having in their upper ends the set-screws F, F, which are held in place by the jam-nuts E; and a series of saws G, G; substantially as described.

704,788. CABLE-HANGER. SILAS DU PERROW, Cleveland, Ohio. Filed May 23, 1902. Serial No. 109,368. (No model.)

Claim.—1. In a cable-hanger, means for engaging the cable, said means being provided with notches, and a suspending-hook having means for entering the said notches, for the purpose specified.

2. In a cable-hanger, means for engaging the cable, said means being provided with notches, and a wire hook that is bent back upon itself to form depending legs, said legs being adapted to engage in the notches, for the purpose specified.



3. In a cable-hanger, means for engaging the cable, said means being provided with notches, a hook of resilient material that is bent back upon itself to form depending legs, and loops at the lower ends of the legs, said loops being adapted to engage with the notches and to be held normally in the same by the resiliency of the hook.

4. In a cable-hanger, a clamping-band for the cable, said band being provided at its ends with notches, a hook formed of resilient material that is bent back upon itself to form depending legs, and loops at the lower ends of the legs for engaging with the notches of the band, said loops being normally held within the notches by the resiliency of the hook.

5. In a cable-hanger, a clamping-band for the cable, said band being provided with the parts F, F that are notched and bent so as to lie face to face when the band is closed, a hook formed of resilient material that is bent back upon itself to form depending legs, loops at the lower ends of the legs for engaging with the notches of the parts F, F, and projections on one side of the notches to prevent the disengagement of the loops therefrom when the hook is moved along its messenger-wire.

6. In a cable-hanger, a clamping-band for the cable, said band being provided with the parts F, F that are notched and bent so as to lie face to face when the band is closed, a hook formed of resilient material that is bent back upon itself to form depending legs, loops at the lower ends of the legs for engaging with the notches of the parts F, and means connected with the parts F and engaging with the loops to prevent the band from opening while the loops are in the notches.

7. In a cable-hanger, a clamping-band for the cable, said band having the parts F, F and H, H, the former parts being provided with notches and being bent so as to lie together face to face when the band is closed, and the parts H, H being bent at an angle thereto, a hook formed of resilient material that is bent back upon itself to form depending legs, and loops at the lower ends of the legs for engaging with the notches of the parts F, F to support the band and cable, and engaging with the parts H, H to prevent the band from opening while the loops are in the notches.

8. In a cable-hanger, a clamping-band for the cable, said band having the parts F, F and H, H, the former parts being provided with notches at their ends and being bent so as to lie together face to face when the band is closed, and the parts H, H being bent at an angle thereto, a hook formed of resilient material that is bent back upon itself to form depending legs, loops at the lower ends of the legs for engaging with the notches of the parts F, F to support the band and cable and engaging with the parts H, H to prevent the band from opening while the loops are in the notches, and upwardly-extending projections on the lower sides of the notches to prevent the disengagement of the loops when the hook is moved along its messenger-wire.

704,789. POLISHING-WHEEL AND METHOD OF MANUFACTURING SAME. BENJAMIN F. ELSON, Brooklyn, N. Y. Filed Nov. 4, 1901. Serial No. 80,990. (No model.)

Claim.—1. As a new article of manufacture, a polishing-wheel composed of disks of a suitable fabric material held together by intervening gutta-percha, substantially as set forth.

2. The method herein specified of manufacturing polishing-wheels, the same consisting in building up layers of a suitable fabric material with intervening layers of gutta-percha, applying heat to the mass to soften the gutta-percha and pressure to consolidate the mass and cement the fabric-material layers together by the gutta-percha, substantially as set forth.

704,790. SNAP FOR FINISHING GLASSWARE. FREDERICK R. GILLINDER and KRAFT BOOTH, Philadelphia, Pa., assignors to Gillinder & Sons, Incorporated, a Corporation of Pennsylvania. Filed Nov. 12, 1901. Serial No. 81,967. (No model.)

Claim.—1. In a device of the character specified, a handle provided with a base having a face that is outwardly and downwardly inclined when the device is in an upright position, movable jaws upon said base adapted to open automatically and rest upon said inclined face to open the same, and a spring-actuated device for closing said jaw.

2. In a device of the character specified, a handle having a base, a groove in said base, a plurality of jaws having pivots secured in said groove, said jaws being adapted to automatically turn on said pivots to open the same, and a spring-actuated device for closing said jaws.

3. In a device of the character specified, a handle having a base, an annular groove in said base, a plurality of jaws having pivots secured within said annular groove, the weight of the outer end of said jaws being sufficient to cause the same to tilt and open, and a spring-actuated device for closing the same.

4. In a device of the character specified, a handle provided with a base having a face that is outwardly and downwardly inclined when the device is in an upright position, a plurality of jaws pivotally mounted upon said base and provided with inwardly-projecting lugs, a spring-actuated rod within said handle, said rod being provided with a head situated to engage said lugs and close the jaws, said jaws being adapted to open automatically and to rest upon said inclined face of the head.

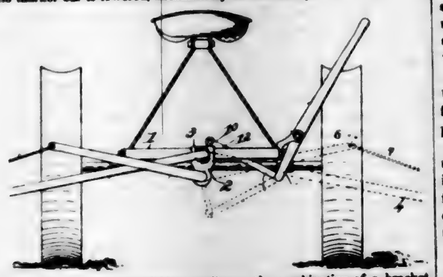
5. In a device of the character specified, a handle provided with a head, an annular groove in said head, a radial groove extending outwardly from said annular groove, a plurality of jaws having pivots situated in said annular groove, a block situated in said radial groove, and means for closing said jaws, the latter being adapted to automatically open.

6. In a device of the character specified, a handle provided with a head, said head being provided with a central depressed portion, an annular groove surrounding the same, and a radial groove extending outwardly from said depressed portion, a plurality of jaws having pivots situated within said annular groove, the weight of the outer ends of said jaws being adapted to open the same, lugs on the inner ends of said jaws situated within said depressed portion, and a spring-actuated rod situated within said handle and provided with a head adapted to engage said lugs.

7. In a device of the character specified, a handle provided with a head having a base with a face that is outwardly and downwardly inclined when the device is in an upright position, a plurality of jaws pivoted upon the side of the base having said inclined face, said jaws being adapted to be tilted and thereby opened and closed.

704,791. MARKER-BAR FOR PLANTERS. WILLIAM H. GLOSSER, Forsyth, Ill., assignor of one-half to George L. Jones, Emery, Ill. Filed May 2, 1902. Serial No. 105,702. (No model.)

Claim.—1. A marker-bar pivotally connected with a planter-frame, a lift-bar pivotally connected with the planter-frame at a point below the pivot of the marker-bar and a link extending from the swinging end of the lift-frame to the marker-bar at a point near the weighted end thereof, the lift-bar and the link being sufficiently long to compensate for the lower position of the pivot of the lift-bar, so that the lift-bar and link will line up with the marker-bar when the marker-bar is in a vertical position and the swinging end of the lift-bar will extend above the marker-bar when the marker-bar is lowered, substantially as described.

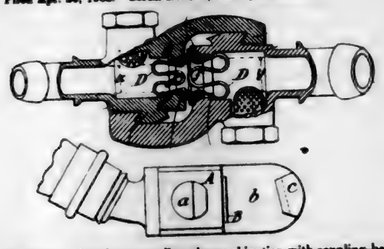


2. In a marker-bar-lifting appliance, the combination of a bracket attached to a planter-frame, a marker-bar pivotally connected with the bracket, a lift-bar having a tubular bearing-stem journaled in the bracket below the pivot of the marker-bar, a crank-bar extending into the tubular stem of the lift-bearing and adjustable lengthwise therein, means for rocking the crank to raise and lower the lift-bar and a link connecting the extended end of the lift-bar with the marker-bar, substantially as described.

3. In a marker-bar-lifting appliance, the combination of a bracket attached to a planter-frame and having a rearward extended sleeve, a lift-bar having a tubular bearing-stem extended through and beyond the sleeve of the bracket, a crank-bar extended into the tubular stem of the lift-bar, a collar fitting on that part of the stem that projects beyond the bracket and a set-screw extending through the collar and the stem into engagement with the crank, substantially as described.

4. In a lifting appliance for marker-bars, the combination of a bracket secured to a planter-frame, a marker-bar pivotally connected with the bracket, a lift-bar pivoted in the bracket below the pivot of the marker-bar, a link connecting the extended end of the lift-bar with the marker-bar, a crank connected with the lift-bar and extended at approximately right angles therewith, a lever fulcrumed to swing in a vertical plane toward and from the pivot of the lift-bar and a link connecting the lever with the crank of the lift-bar, substantially as described.

704,792. HOSE-COUPLING. EDWARD R. GOLD, New York, N. Y. Filed Apr. 23, 1902. Serial No. 105,194. (No model.)



Claim.—1. In a hose-coupling, the combination with coupling-heads of different sizes adapted to intercouple, the said heads having normal seats of different sizes of opening, of a compromise seat adapted to replace one of said normal seats and adapted to conform to the face of the other seat to make a tight joint.

2. In a hose-coupling, two coupling-heads of different sizes adapted to intercouple, having abutting seats, the seat of the larger head contracted to substantially the opening of the smaller head whereby to engage substantially the full face of the seat thereof to make a tight joint.

3. In a hose-coupling, the combination with coupling-heads of different sizes adapted to intercouple, said heads having normal seats of different sizes of opening, of a compromise seat adapted to replace one of said normal seats and adapted to conform to the face of the other seat to make a tight joint, and said seats respectively adapted to be removable from the head to enable either to be replaced by the other.

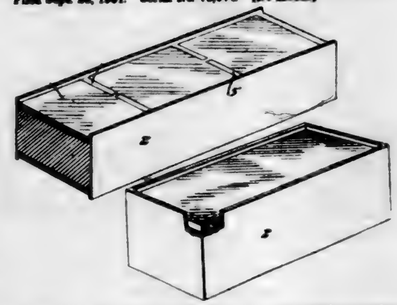
4. In a hose-coupling, two coupling-heads of different sizes adapted to intercouple, having abutting seats, the seat of the larger head consisting of a segment of a sphere fitting in a spherical socket in said head and contracted to substantially the opening of the smaller head whereby to engage substantially the full face of the seat thereof to make a tight joint.

5. In a hose-coupling, the combination with coupling-heads of different sizes adapted to intercouple, the said heads having normal seats of different sizes of opening, of a compromise seat adapted to replace one of said normal seats and adapted to conform to the face of the other seat to make a tight joint, and said compromise seat having a flat unyielding seating face of metal adapted to engage either a hard or soft abutting seat without injury to the face of the latter.

6. A compromise seat for a hose-coupler, having the form of a normal seat of the larger size, and an internal flange extending its seating face inwardly, said flange adapted to be removed to convert the compromise seat into a larger normal seat.

7. A compromise seat for a hose-coupler having the form of a normal seat of the larger size with the addition of an internal flange extending its seating face inwardly, and a retaining-spring engaging the inner face of the seat behind said flange, so that said flange may be removed to convert the compromise seat into a larger normal seat without incapacitating said spring.

704,793. PLATING METAL. WILLIAM GRIFFITH, Pittsburg, Pa. Filed Sept. 23, 1901. Serial No. 76,274. (No model.)



Claim.—1. The method of plating, iron, steel, and other metals with a different metal, such as copper or other metal or alloy, consisting in covering the surface of the metal to be plated with the coating metal or alloy in a pulverized condition, placing a plate of the coating metal on the pulverized metal, heating the metals, and subjecting them to pressure; substantially as described.

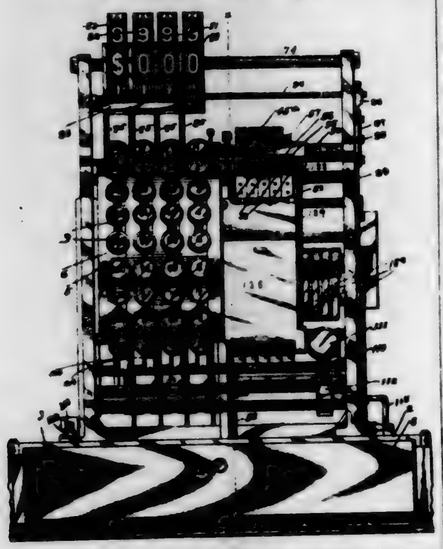
2. The method of plating a metal with another metal which fuses at a different degree of heat, consisting in first covering the surface of one of the metals with a layer of the other metal in a pulverulent condition, then heating the two metals when mechanically united into a pack to a temperature insufficient to fuse the more readily fusible metal, then covering the metal which fuses at the lower degree of heat, and subjecting the pack to a greater degree of heat; substantially as described.

704,794. PATTERN FOR DRESS-SKIRTS. HERMINE GUIDER, New York, N. Y. Filed Feb. 5, 1902. Serial No. 92,621. (No model.)

Claim.—A skirt-pattern having a body representing a dress-skirt divided longitudinally, and a flexible cord attached to the waist portion, said cord having its end looped to form handpiece extending outwardly

approximately in line with the upper edge of said body, substantially as set forth.

704,795. CASH REGISTER AND INDICATOR. HENRY S. HALLWOOD, Columbus, Ohio, assignor, by mesne assignments, to the Hallwood Cash Register Company, Columbus, Ohio, a Corporation of Ohio. Filed Feb. 7, 1898. Serial No. 669,359. (No model.)



Claim.—1. In a registering-machine, the combination of a key, a lock-plate for holding said key when fully depressed, and a latch for normally holding said lock-plate out of operative position, said latch being adapted to be tripped by the key to permit the lock-plate to operate, substantially as described.

2. In a registering-machine, the combination of a key, a pivoted lock-plate for holding said key when fully depressed, and a pivoted latch-plate for normally holding the lock-plate out of operative position, said latch-plate being adapted to be tripped by the key to permit the lock-plate to operate, substantially as described.

3. In a cash-register, the combination with a registering mechanism, a set or series of amount-keys and means whereby the degree of movement of said registering mechanism is controlled by the key depressed, of a fulcrumed lock-plate adjacent to the stems of said keys, a fulcrumed latch-plate adjacent thereto and means whereby the contact of a depressed key or projection thereof with said latch-plate causes said lock-plate to lock said key when fully depressed, substantially as and for the purpose specified.

4. In a cash-register, the combination with a registering mechanism, a key-frame and a set or series of amount-keys arranged therein, and a fulcrumed lock-plate adjacent to said key-stems having projecting hook-fingers adapted to be engaged with projections on the adjacent key-stems when the latter are depressed and a pin 23 projecting from said lock-plate, of a fulcrumed latch-plate adjoining said lock-plate with which said key-stem projections are adapted to contact when the keys are depressed, a recess 26, a shoulder 27 in said latch-plate, said lock-plate pin 23 adapted to be disengaged from said shoulder 27 and engaged in the recess 26 by the depression of one of said keys, substantially as and for the purpose specified.

5. In a cash-register, the combination with a registering mechanism, a sliding cash-drawer, a set or series of amount-keys and means whereby the extent of operation of said registering mechanism is controlled by the key or keys depressed, a toothed or notched lock-plate fulcrumed adjacent to said key-stems and means for dropping the latter into engagement with said key-stems when the latter are depressed, of a hinged or fulcrumed lifting-frame 37, a lever-arm 36 connected with said lifting-frame and means whereby the closing of said drawer produces a depression of said lever-arm and a lifting or unlocking influence of the frame 37 on the previously-lowered lock-plate, substantially as and for the purpose specified.

6. In a cash-register, the combination with a registering mechanism, a cash-drawer, a set of amount-keys for controlling the degree of operation of said registering mechanism and a lock-plate and means for dropping the latter into engagement with a depressed key, of a fulcrumed lifting-frame beneath said lock-plates, a lever-arm connected therewith, a fulcrumed frame-yoke 41 adapted to be raised by the closing of said cash-drawer and adapted in raising to contact with said lever-arm and produce an elevation of said lock-plate, substantially as and for the purpose specified.

7. In a cash-register, the combination with a set of registering-wheels, a key-frame and a set or series of keys in said frame for each of said registering-wheels, a fulcrumed lock-plate adjacent to each set of key-stems, said lock-plate adapted to drop downward and engage with a depressed key, and a fulcrumed bell-crank 29 having one of its arms jointedly connected with the lowered lock-plate, and having its forward arm curved upward and provided in its inner end portion with a notch, of a fulcrumed frame for each of said key sets or series, each frame consisting of toothed segment portion having a laterally-projecting pin adapted to contact with the curved arm of said lever 29, and a yoke portion, said segment having its toothed portion on an arc eccentric with its shaft and normally prevented from movement by engagement with one arm of said bell-crank, and means whereby the dropping of said lock-plate releases said bell-crank arm from engagement with the segment, substantially as and for the purpose specified.

8. In a registering-machine, a registering-wheel, a pawl for turning said wheel, and means for operating said pawl, a stop-plate, and means for moving said stop-plate into the path of the pawl when said pawl-operating means approaches the limit of its movement, substantially as described.

9. In a cash-register, the combination with a set of toothed registering-wheels, a fulcrumed pawl engaging the teeth of each wheel, a cash-drawer, a yoke-frame 41 adapted to be swung upward by the closing of said drawer and means for dropping said pawls down over a predetermined number of registering-wheel teeth, of a fulcrumed stop-bar 67 and a finger extending therefrom, said stop-bar contacting with and limiting the upward movement of said pawls when the frame 41 is raised to contact with said finger, substantially as and for the purpose specified.

10. In a cash-register, the combination with a registering mechanism, a set of amount-keys for controlling the operation of said registering mechanism and a cash-drawer, the opening of which sets the registering mechanism for operation and the closing of which completes said operation, of a fulcrumed lever 42ᵇ, a lever-arm 50 fulcrumed thereto and normally bearing against the drawer and a spring 52 connecting said lever-arm with the machine-frame, substantially as and for the purpose specified.

11. In a cash-register, the combination with a set of toothed registering-wheels, amount-keys, a cash-drawer, an operating-pawl for each of said registering-wheels, a set of pawl-operating swinging frames 18ᶜ and means for controlling the degree of movement of the same, of a fulcrumed lever 42ᵇ normally supporting said frame 18ᶜ and a spring-actuated lever-arm 50 fulcrumed to said lever and exerting an opening pressure against said drawer, substantially as and for the purpose specified.

12. In a cash-register, the combination with a registering mechanism, a set of amount-keys for controlling the same, and a cash-drawer, of a fulcrumed lever 42ᵇ and a lever-arm 50 fulcrumed thereto, the latter normally exerting a pressure against the cash-drawer, a fulcrumed frame 41 supported upon said lever-arm and adapted to follow the same and a spring 52 connecting said lever-arm and machine-frame, substantially as and for the purpose specified.

13. In a cash-register, the combination with a set of toothed registering-wheels, amount-keys, cash-drawer, an operating-pawl for each of said wheels, a set of pawl-operating swinging frames 18ᶜ, a swinging frame 41 and means whereby the opening and closing of the cash-drawer produces a downward-and-upward swinging movement of said frames, of fulcrumed arms 29ᵃ adapted to lock said frames 18ᶜ when the drawer is closed and to disengage therefrom when the drawer is open and a trip-arm 36 adapted to contact with the frame 41 and move said arms 29ᵃ into locking engagement with the frames 18ᶜ, substantially as and for the purpose specified.

14. In a cash-register, the combination with the framework, a registering mechanism, a drawer and a drawer-releasing key, a latch-bar 113 adapted to engage the drawer when closed and having a spring-actuated arm 115, of a fulcrumed lever 107 disconnected from said latch-bar and having one of its arms in contact with said drawer-releasing key and its remaining arm adapted to raise the arm 115 of said latch-bar by contact with the latter when said key is depressed, substantially as and for the purpose specified.

15. In a cash-register, a key, means for locking said key, a cash-drawer, a register-wheel, means for turning said wheel, a lifting-frame for said locking means, and connections between said frame and drawer whereby the former is lifted to unlock the key when the drawer is pushed in and after the register-wheel has ceased turning, substantially as described.

16. In a cash-register, a key, means for locking said key, a cash-drawer, a register-wheel, a frame 18ᶜ controlled by the key for turning said wheel, a second frame 41, means for lifting said second frame when the drawer is pushed in, a device connected with said second frame for unlocking the key, and means for giving said second frame an excess of movement after the first frame and the register-wheel have come to rest for the purpose of unlocking the key, substantially as described.

17. In a cash-register, the combination with a pawl-operated registering mechanism, a set of pawl-operating frames 18ᶜ and a swinging frame 41, a cash-drawer, a fulcrumed lever 42 supporting said frames 18ᶜ, a lever-arm 50 pressing the drawer and fulcrumed to said lever 42ᵇ, an upper extension 51 on said lever-arm upon which said frame 42ᵇ rests and by means of which the frame 41 is lifted above the frames 18ᶜ when the drawer is closed, substantially as and for the purpose specified.

18. In a cash-register, a drawer, a key for releasing said drawer, a normally locked indicator, means for releasing the said indicator when the said key is depressed, and means for locking the indicator when the drawer is pushed inward, substantially as described.

19. In a cash-register, an indicator, means for setting said indicator, a drawer, a releasing device for said drawer, means controlled by the drawer for locking the indicator, and means controlled by the releasing device for unlocking the same, substantially as described.

20. In a cash-register, an indicator, means for setting said indicator, a spring-actuated rock-shaft, a device on said shaft for locking the indicator in its set position, a cash-drawer, means controlled by said drawer for rocking said shaft in one direction against the tension of its spring to lock the indicator, and a key for releasing said shaft to permit it to rock in the opposite direction so that the said device will unlock the indicator, substantially as described.

21. In a cash-register, the combination with a frame, a registering mechanism, cash-drawer, rotary indicator or target wheels, rack-bars for operating the same, swinging frames 18ᶜ, means for operating the latter by movement of the drawer and for contributing motion from said frames to said indicator-wheels through said rack-bars, of a hinged binding-strip 98 adjacent to said rack-bars, a drawer-releasing key and means whereby the operation of said key disengages the binding-strip and rack-bars and whereby the engagement is resumed by the closing movement of the drawer, substantially as and for the purpose specified.

22. In a cash-register, the combination with a frame, a registering mechanism, a cash-drawer, indicator-wheels, rack-bars for operating the same, swinging frames 18ᶜ, means for operating the latter by movement of the drawer and for contributing motion from said frames to said indicator-wheels through said rack-bars, of a hinged binding-strip adapted to contact with and lock said rack-bars, a fulcrumed lever 99, a jointed connection between the latter and said binding-strip, a trip-lever fulcrumed to said lever 99, a drawer-releasing key, a fulcrumed lever 107 contacting with the latter and means whereby the depression of said key and movement of said lever 107 produces a lifting movement of said trip-lever and a consequent movement of the lever 99 to throw the binding-strip out of contact with the rack-bars, substantially as and for the purpose specified.

23. In a cash-register, the combination with a frame, a registering mechanism, a cash-drawer, indicator-wheels, rack-bars for operating the latter, swinging frames 18ᶜ, means for operating the registering mechanism by movement of the drawer and for contributing motion from said frames to said indicator-wheels through said rack-bars, and a swinging frame 41 adapted to be moved with the drawer, of a binding-strip adapted to contact with and hold the rack-bars, a trip-lever having a shoulder 100ᵃ and adapted to control the engagement and disengagement of the binding-strip and rack-bars, said frame 41 adapted by contact with the trip-lever shoulder as the drawer is moved to a closed position and thereby cause a binding engagement of the binding-strip and rack-bars, substantially as and for the purpose specified.

24. In a cash-register, the combination of the registering mechanism, rotary indicators and means for normally holding the same against rotation, and a sliding cash-drawer, mechanism interposed between said indicators, and a cash-drawer whereby said indicators are released and operated at the opening of the drawer, said means whereby the indicators are held against rotation at the first movement of the closing of the drawer, substantially as and for the purpose specified.

25. In a cash-register, the combination of a registering mechanism, a set of amount-keys adapted to control the extent of operation of said registering mechanism, a sliding cash-drawer and means whereby the depression of a key of any set locks the remaining keys of said set against depression when the drawer is open, and connections between the parts whereby the depression of the keys of the remaining sets does not offset the registration when the drawer is open, substantially as and for the purpose specified.

26. In a registering-machine, two banks of keys, means for locking the keys in a bank when one is depressed, a drawer, and means controlled by the drawer by which the keys in the second bank remain unlocked and may be depressed but are rendered ineffectual while the said drawer is open, substantially as described.

27. The combination of cash-keys arranged in series, one series of keys for each denomination, a series of registering devices, also one for each denomination, intermediate connecting devices between each series of keys and the registering device of corresponding denomination, a common operating device adapted in its normal position to hold all the intermediate connecting devices, a locking device for each of said connecting devices adapted to be withdrawn by the operation of any key in a series when the common operating device is in its normal position, said locking device being held against disengagement when said common actuating device is moved to an unusual position whereby the cash-keys are free to move in either position of the common actuating device but offset the registering mechanism only when moved prior to the movement of the common actuating device, substantially as and for the purpose specified.

28. The combination with the registering-wheels and the cash-keys, and the intermediate yokes or bars controlled by the cash-keys and adapted to operate the registering-wheels, a common operating device for all of said yokes or bars, a lock for each of said yokes or bars adapted to be released by the action of any key in the series corresponding to said yoke or bar when the common actuating device is in a normal position, said lock being adapted to hold said yoke or bar independent of the action of said keys when the common actuating device is in an abnormal position, substantially as and for the purpose specified.

29. The combination with the cash-keys and locking device therefor, a series of registering devices and intermediate connections between the cash-keys and said registering devices, a common operating device for said intermediate connections, a connection between the common operating device and a locking device for the keys, and means, substantially as described, for imparting to said common operating device an auxiliary movement after the actuating connections have been brought to their normal position whereby the keys are released after all the other operations have been completed, substantially as specified.

30. A series of registering-wheels, pawl-levers therefor, and a common operating device for operating said pawl-levers, a stop-plate common to all of said pawl-levers, and means for moving said stop-plate into the path of the pawls of said pawl-levers when the common operating device approaches the limit of its movement, substantially as specified.

31. The combination with a series of registering-wheels, pawl-levers having pawls for operating the same, intermediate connecting devices for each of said pawl-levers, and a common actuating device for all of said connecting devices, a movable stop-plate arranged above said pawls, and means, substantially as described, for moving said stop-plate into the path of said pawls to form a stop therefor when the common actuating device approaches the limit of its stroke, substantially as specified.

32. The combination with the registers, the swinging actuating-yoke, an operating device, such as a cash-drawer, to move said yoke, and a lock for said cash-drawer, a yielding arm arranged in the path of said yoke, said arm being adapted to cushion the fall of said yoke and furnish the means for returning the locking device to its normal position as said yoke is moved, substantially as specified.

33. In a cash-register, an indicator, a swinging yoke for moving the same to its indicating position, means for locking the indicator, and a second swinging yoke for unlocking the same, substantially as described.

34. In a cash-register, a swinging actuating-yoke, a device for cushioning the downward movement of said yoke, an indicator, and means for locking the indicator, said means being operated by the cushioning device, substantially as described.

35. The combination with the registers and an intermediate actuating device such as a swinging yoke, a normally locked movable part such as a cash-drawer to act on said yoke, normally locked indicators, and a yielding arm in the path of said actuating-yoke and connected with the holding devices for said drawer and indicators, said arm being adapted to cushion the movement of said actuating-yoke and furnish the means for returning the holding devices for the drawer and indicator to their normal positions, substantially as specified.

36. In a cash-register, the combination with a registering mechanism, of transfer-pawls therefor, an angular plate adapted to lift said transfer-pawls, a movable lid for concealing the registering mechanism, and a spring-pressed rod connecting said lid and angular plate so that the latter is rocked to lift the transfer-pawls when the lid is opened, substantially as described.

37. In a registering-machine, a register-wheel, a movable pawl for turning said wheel, a rocking latch adjacent to the path of the pawl, and means for turning said latch to engage the pawl when it approaches the limit of its forward movement.

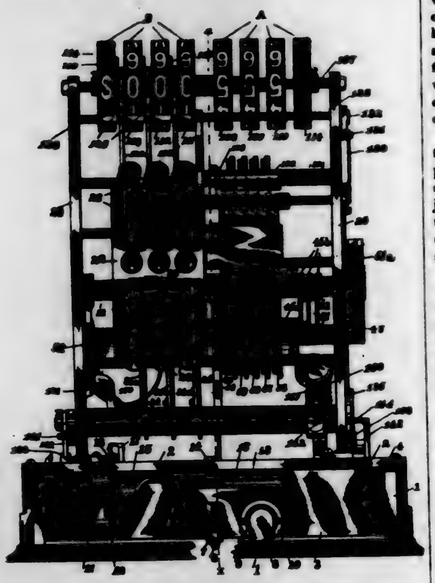
38. In a registering-machine, a drawer, a register-wheel, a pawl driven from said drawer for turning said wheel, and means operated by said drawer for locking the pawl to the wheel as the pawl approaches the limit of its forward movement.

30. In a registering-machine, a drawer, a registering-wheel, a pawl driven from said drawer for turning said wheel, a yoke operated by said drawer, and means operated by said yoke for locking the pawl to the wheel as the pawl approaches the limit of its forward movement.

40. In a registering-machine, a register-wheel, a movable pawl for turning the same, a swinging yoke for driving the pawl, a latch adjacent the path of the pawl, and a second yoke for moving the latch into the path of the pawl to lock the same to the wheel as it approaches the end of its movement.

41. In a registering-machine, a register-wheel, driving means for turning said wheel, a checking device for said driving means, and mechanism for moving said device into the path of the driving means as the latter approaches the limit of its movement.

704,796. CASH-REGISTER. HENRY S. HALLWOOD, Columbus, Ohio, assignor, by mesne assignments, to the Hallwood Cash Register Company, Columbus, Ohio, a Corporation of Ohio. Filed Jan. 3, 1899. Serial No. 700,933. (No model.)



Claim.—1. In a cash-register, the combination with the framework, a reservedly-sliding drawer therein, and means for latching said drawer in a closed position, of a drawer-opening lever fulcrumed on the frame above the drawer and having one of its ends in contact with said drawer, a weighted arm 54 movably supported from the machine above said drawer, a link connecting said arm 54 and said lever-bar whereby the weight of the arm throws the drawer open when released and means for releasing said drawer, substantially as specified.

2. In a cash-register, the combination with the framework, a sliding drawer therein, a friction-roller journaled from said drawer, and means for latching the latter in a closed position, of a fulcrumed drawer-opening lever 13 having one of its ends in contact with said roller, a weighted arm 54 movably supported from the machine above said drawer, a jointed connection between said arm 54 and said lever-bar 13 whereby the weight of the arm throws the drawer open when released and means for releasing said drawer, substantially as specified.

3. In a cash-register, the combination with a frame, one or more registering-wheels journaled in said frame, a set of value-keys projecting from the front of said machine and mechanism between said value-keys and registering-wheels whereby the latter will register an amount corresponding with the value-keys depressed, of a sliding drawer and a latch therefor, an arm having a swinging support in said machine, a drawer-opening lever fulcrumed near its center to the frame above the drawer, and engaging therewith and connections between said arm and lever whereby the downward movement of the arm forces the drawer rearward when the same is released, substantially as specified.

4. In a cash-register, the combination with the framework, a sliding drawer therein and a fulcrumed latch-bar adapted to retain said drawer in a closed position, of a lever 149 journaled in the framework, said lever having forwardly and rearwardly extending arms and releasing-keys arranged respectively at the front and back of said machine and means whereby the depression of either of said keys results in a lifting contact of one arm of said lever 149 with said drawer latch-bar, substantially as specified.

5. In a cash-register, the combination with the framework, a sliding cash-drawer therein and a fulcrumed latch-bar adapted to engage said drawer to retain it in a closed position, of a two-arm lever 149 journaled in said framework, a pivoted lever 157, releasing-keys 151 and 155 arranged respectively at the front and back of the machine, one of said keys adapted to contact with one arm of the lever 149 and the remaining key adapted to contact with one arm of the lever 157, the remaining arm of the latter being beneath an arm of the lever 149 and means whereby the swinging of the lever 149 causes a lifting contact of one of its arms with said latch-bar, substantially as specified.

6. In a cash-register, the combination with the framework, a set of value-keys, a sliding cash-drawer, a registering mechanism and a fulcrumed lock-plate adapted to swing downward and retain one of said keys in a depressed position, of a lifting-frame 159 fulcrumed beneath and adapted to exert a lifting action on said lock-plate, a lifting-lever 162 fulcrumed to said framework, said lever being adapted to swing downward when the drawer is opened and to be forced upward by contact with said drawer when the latter is closed, said fulcrumed lifting-frame having its outer arm supported by said lever, substantially as specified.

7. In a cash-register, the combination with the framework, a registering mechanism, a set of value-keys adapted to be independently depressed, a sliding cash-drawer, and a fulcrumed lock-plate adapted to swing downward and temporarily lock a depressed key, of a lifting-frame journaled beneath said lock-plate, and a lifting-lever mounted to slide on the machine-frame and adapted to engage said drawer when it is closed and be moved longitudinally by the closing movement of said drawer, said lifting-lever engaging said lifting-frame, substantially as specified.

8. In a cash-register, the combination with the framework, a set of value-keys, a sliding cash-drawer, a catch-piece on said drawer, a registering mechanism and a fulcrumed lock-plate adapted to swing downward and retain one of said keys in a depressed position, of a lifting-frame 159 fulcrumed beneath and adapted to exert a lifting action on said lock-plate, a lifting-lever having a fulcrumed and sliding connection with the framework, said lever adapted to engage a catch-piece on said drawer when the latter is closed and adapted by contact with said drawer to be lifted during the closing action, notches 166 and 165 in said lifting-lever, one of which is adapted to receive an extension of said lifting-frame when the drawer is open and one of which is adapted to receive said lifting-frame extension when the drawer is closed, substantially as specified.

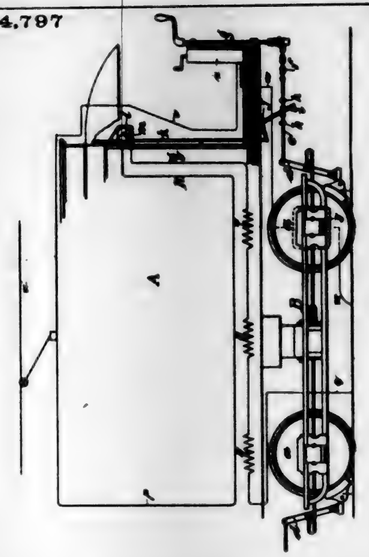
9. In a cash-register, the combination with the framework, a sliding drawer, a set of value-keys, a registering mechanism and a swinging frame-piece 45, the degree of movement of which is dependent on the value-key depressed, of a journaled indicator-wheel carrying a pinion, a rack-bar engaging said pinion, a fulcrumed lever-bar 122 having a jointed connection with said rack-bar, a weight-arm 125 swinging from said frame-piece 45 and having its upper portion engaging a projection of said lever-arm 122 and means whereby the depression of a value-key and the opening of the cash-drawer produces a downward swinging movement of said frame-piece 45 and whereby the closing of said drawer produces an upward movement thereof, substantially as specified.

10. In a cash-register, the combination with a frame, one or more registering-wheels journaled in said frame, a set of value-keys projecting from the front of said machine and mechanism between said value-keys and registering-wheels whereby the latter will register an amount corresponding with the value-keys depressed, of a sliding drawer and latch therefor, a swinging lever through which the movement of the drawer is communicated to the adding and indicating mechanism, and releasing-keys arranged respectively at the front and back of the machine so that either may be operated at will, substantially as specified.

704,797. RAILWAY HEATER SYSTEM. SAMUEL H. HARRINGTON, New York, N. Y. Filed Jan. 3, 1901. Serial No. 42,008. (No model.)

Claim.—In a railway system, a main source of electrical supply, a car having a motor for propelling the same and deriving its power from said source of electrical supply, an electric heater upon said car and deriving energy from said source of electrical supply, a switch controlling the circuit of said heater, brakes upon said car, brake-operating mechanism, and operative connection between said brake-operating mechanism and said switch whereby the latter is operated by the operation of the former; substantially as described.

704,797



704,798. BLUE ANTHRAQUINONE DYE AND PROCESS OF MAKING SAME. CHRISTOPH HAUSSMANN, Höchst-on-the-Main, Germany, assignor to Farbwerke, vorm. Meister, Lucius & Brüning, Höchst-on-the-Main, Germany, a Corporation. Filed Jan. 27, 1902. Serial No. 91,519. (Specimens.)

Claim.—1. The process for the manufacture of new blue dyestuffs of the anthraquinone series, which consists in treating the herein-described tetraamidoanthraquinones, with formaldehyde and sulfurous acid, substantially as described.

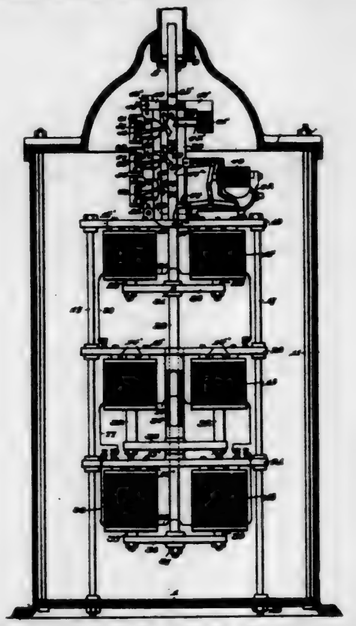
2. The dyestuffs obtained by combining the herein-described tetraamidoanthraquinones, with formaldehyde and sulfurous acid, being dark-blue powders, soluble in concentrated sulfuric acid to a blue and in water to a green-blue solution, which does not change on addition of dilute acids or alkalies, dyeing wool greenish-blue shades.

704,799. ADJUSTABLE CHAIN-HEADING FOR CHAIN OR ROPE CURTAINS OR VALANCES. WILLIAM S. HEPNER and ALEXANDER G MORRISON, St. Louis, Mo. Filed Feb. 13, 1902. Serial No. 94,057. (No model.)

Claim.—1. An adjustable chain-heading for chain or rope curtains, comprising a pole or bar having a flat upper face and adapted to be adjustably secured to the lower face of the upper casing of the opening; clips or hangers slidingly mounted upon the pole or bar; a chain or rope connecting said clips or hangers together in series, said chain or rope being long enough to hang loosely between said clips or hangers; and loops connected to said chain or rope half-way between the clips or hangers and adapted to receive the hooks of the curtain; substantially as specified.

2. In a device of the class described, a pole or bar having a flat side, said flat side being adapted to engage the lower face of the casing of the opening; clips or hangers slidingly mounted upon said pole or bar; means of adjusting the pole or bar to grip the clips or hangers, as required to hold them rigidly in their adjusted positions; and a chain or cord connecting said clips or hangers; substantially as specified.

704,800. SIGNAL. REINHOLD RIEHAM, Crafton, Pa. Filed Oct 11, 1901. Serial No. 78,201. (No model.)



Claim.—1. In signals, the combination with the signal-arm automatically held in the danger position, of electrically-actuated shifting means to shift the signal-arm to caution and danger, with track-circuits controlled by train movements, and a separate circuit also controlled by train movements to act as a choke for the signal when shifted to caution or danger position.

2. In signals, the combination with the signal-arm automatically held in the danger position, of electrically-operated shifting means to shift the signal to caution and clear positions, with track-circuits controlled by train movements, with a circuit connected to the shifting means to act as a choke for the movement of the signal to certain positions.

3. In signals, the combination with the signal-arm movable to different positions, of electrically-operated shifting means with circuits connected thereto and controlled by train movements, a circuit-controller in said circuits, with a choke-circuit closed by the signal in its movement to certain positions.

4. In signals, the combination with the semaphore-arm, of electrically-operated shifting means with circuits controlled by train movements, and a circuit-controller in the circuit, said controller including spring-clips and contact-fingers which are moved into and out of engagement with said clips during the shifting of the signal to make and break the circuit.

5. In electrically-operated signals, a circuit-controller in the operating circuits and comprising spring-clips and contact-fingers which latter are movable into and out of engagement with the clips to make and break the circuit at predetermined times.

6. In signals, the combination with the signal-arm, of electrically-operated means for shifting the signal, a driving-rod connecting the signal-arm to the shifting means, a circuit-controller included in the circuit of the shifting means, and pins carried by the driving-rod to make and break the circuit in the circuit-controller at predetermined times.

7. In a signal, the combination of a signal-arm automatically held in the danger position, of electrically-operated shifting means controlled by train movements for shifting the signal to different positions, a driving-rod connecting the signal-arm to the shifting means, a circuit-controller in the circuit of the shifting means, means carried by the driving-rod for engagement with the circuit-controller to make and break the circuit at predetermined times, and an electric lock for holding the signal after the same is shifted into position.

8. In signals, the combination with the signal-arm automatically held in the danger position, of a series of electromagnets connected to the arm and constituting a means for operating the signal by the aid of circuits

controlled by train movements, and a choke-circuit controlled by an auxiliary relay for cushioning the signal when shifted to different positions.

9. In electrically-operated signals, a circuit-controller in the operating-circuits and comprising spring-clips and pivotal contact-fingers which latter are movable into and out of engagement with the spring-clips to make and break the circuit at predetermined times.

10. In signals, the combination with a signal, and electrically-operated shifting means therefor, of a box or casing for inclosing the shifting means, said box or casing comprising a base having a ledge with side and end walls fitted thereon, a cap-piece fitted on the side and end walls, a hollow cone carried by said cap-piece and provided with a downwardly-projecting tubular extension to receive the support for the signal-arm, and tie-bolts connecting the cap-piece and base, substantially as described.

11. The combination of a signal-arm, a driving-rod connected thereto, suitably-supported electromagnets having their cores connected to said driving-rod, with track-circuits connected to a track-relay and controlled by train movements, a circuit-controller connected to the circuits, and insulated pins carried by the drive-shaft to operate the circuit-controller to make and break the circuit at predetermined times, substantially as described.

12. In signals, the combination with the signal-arm, and the driving-rod connected thereto, of electrically-operated means for shifting the signal, a circuit-controller included in the circuit of the shifting means, and insulated pins carried by the driving-rod to actuate the circuit-controller to make and break the circuit at predetermined times.

13. In signals, the combination with the signal-arm, of electrically-operated means for shifting the signal, a driving-rod connecting the signal-arm to the shifting means, a circuit-controller in the circuit of the shifting means, and including spring-clips and pivoted contact-fingers, and means carried by the driving-rod to actuate said fingers to make and break the circuit in the controller at predetermined times.

14. In signals, the combination with the signal-arm, of electrically-operated means for shifting the signal, a driving-rod connecting the signal-arm to the shifting means, a circuit-controller included in the circuit of the shifting means, means carried by the driving-rod to make and break the circuit in the circuit-controller at predetermined times, and means for locking the signal after the same is shifted into position.

15. In signals, the combination with the signal-arm automatically held in the danger position and movable to caution and clear positions, of a series of electromagnets arranged in pairs and constituting the operating mechanism for shifting the signal to caution and clear positions, said magnets having their cores attached to the driving-rod of the signal, one pair of said magnets acting as the shifting means for the signal to the caution position and another pair of said magnets acting as the shifting means for the signal to the clear position.

16. In signals, the combination with the signal-arm automatically held in the danger position and movable to caution and clear positions, of a series of electromagnets arranged in pairs and constituting the operating mechanism for shifting the signal to caution and clear positions through track-circuits controlled by train movements, the cores of the said magnets attached to the driving-rod of the signal, one pair of said magnets acting as shifting means for the signal to caution position and another pair of said magnets acting to shift the signal to the clear position.

17. In signals, the combination with a signal-arm automatically held in the danger position and movable to caution and clear positions, of a series of electromagnets arranged in pairs and constituting means for shifting the signal to caution and clear positions through track-circuits controlled by train movements, one pair of said magnets acting as the means for shifting the signal to caution position, another pair of said magnets acting to shift the signal to the clear position, an auxiliary cut-out for said magnets, and an automatic lock for holding the signal at the caution and clear positions.

18. In an electric signal system for railroads, the combination with a signal-arm automatically held in the danger and caution positions, of electromagnets connected to a source of electric supply and constituting means for shifting the signal-arm in one direction to caution and clear positions, an auxiliary relay in the circuit with said electromagnets, a track-relay controlling the circuit of the auxiliary relay, said track-relay in circuit with track-circuits controlled by train movements in opposite running directions.

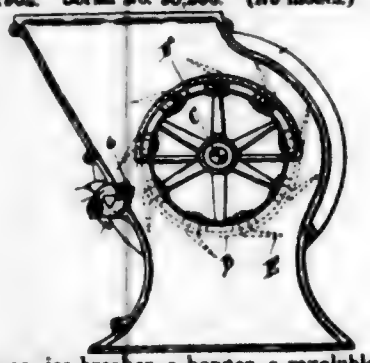
19. In signals, the combination with a signal-arm automatically held in the danger position and movable to caution and clear positions, of a series of electromagnets constituting the operating means for shifting the signal in one direction to caution and clear positions, a source of electric energy connected to said magnets through an auxiliary relay, and automatic cut-outs controlled through the track-relay connected to track-circuits, said track-circuits controlled by train movements in both running directions.

20. In an electric signal system for railroads, the combination of a signal-arm automatically held in the danger and caution positions and movable to caution and clear positions, and means for holding the signal-arm at caution and clear positions, said means operated through track-circuits controlled by train movements in opposite running directions.

21. In signals, the combination with the signal-arm automatically held in the danger position and electrically movable to caution and clear positions, and the driving-rod connected to said arm, of a series of cores attached to the driving-rod of the signal-arm, electromagnets arranged to energize said cores through circuits at predetermined times, substantially as and for the purpose set forth.

22. In signals, the combination with the signal-arm automatically held in the danger position and electrically movable to caution and clear positions, and a driving-rod connected to said signal-arm, of a series of armatures attached to said driving-rod, electromagnets arranged to energize said armatures through circuits at predetermined times, and track-circuits controlled by train movements in both running directions.

704,801. ICE-BREAKER. CHARLES HILBERT, Cincinnati, Ohio. Filed Feb. 24, 1902. Serial No. 95,296. (No model.)



Claim.—1. In an ice-breaker, a hopper, a revoluble reducing-roll therein, means for rotating the same, a shaft having two or more lines of radial blades differently spaced horizontally, means for supporting the said shaft in the hopper in a fixed position with any one of said lines of blades projecting toward the armed roll and forming a stationary abutment for the ice, substantially as described.

2. In an ice-breaker, a hopper, a revoluble reducing-roll therein, means for rotating the same, a shaft having two or more lines of blades radially projected therefrom, the blades being differently spaced horizontally on the different lines, one end of said shaft being socketed whereby the shaft may be supported in fixed position with any one of said horizontal lines of blades projecting into the hopper toward the reducing-roll forming an opposing abutment therefor, substantially as described.

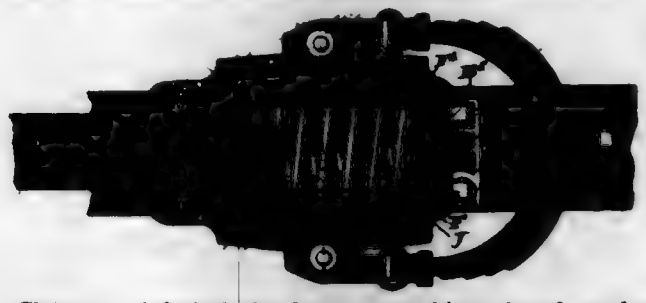
3. In an ice-breaker, a hopper, a revoluble reducing-roll therein, means for rotating the same, a shaft having two or more lines of blades radially projecting therefrom, the blades being differently spaced horizontally on the different lines, one end of said shaft being polygonal-shaped, a socket-plate therefor on the frame of the machine, and means for detaching said shaft from its socket whereby the shaft may be fixed in different positions with any selected one of the lines of blades projecting into the hopper toward the reducing-roll forming a stationary abutment therefor, substantially as described.

4. In an ice-breaker, a hopper, a revoluble reducing-roll therein, means for rotating the same, a shaft having two or more lines of blades radially projecting therefrom, the blades being differently spaced horizontally on the different lines, means outside of said hopper for supporting said shaft in different fixed positions and slots formed in the casing of the hopper through which the said blades project toward the reducing-roll forming a fixed opposing abutment therefor, substantially as described.

5. In an ice-breaker, a hopper, a revoluble reducing-roll therein, means for rotating the same, a shaft having two or more lines of blades radially projecting therefrom, the blades being differently spaced horizontally on the different lines, means outside of said hopper for supporting said shaft, a socket end formed on said shaft, a socket-plate supported on the hopper-casing, and slots in the hopper-casing for the projection of said blades into the hopper, and means for detaching said shaft from said socket-plate, whereby the shaft may be fixed in different positions with any selected one of said lines of blades projecting through the slots and forming a stationary opposing abutment to the reducing-roll, substantially as described.

6. In an ice-breaker, a hopper, a revoluble reducing-roll therein, means for rotating the same, a shaft having two or more lines of blades radially projecting therefrom, the blades being differently spaced horizontally on the different lines, a journal for one end of said shaft in the hopper-casing outside of the hopper, the other end of said shaft being socket-shaped, a socket-plate detachably secured to the other side of the hopper-casing, and slots in the intermediate hopper-casing through which the blades of any selected one of said lines project into the hopper and toward the reducing-roll forming a stationary opposing abutment therefor, substantially as described.

704,802. DRAFT-RIGGING FOR CARS. JAMES A. EIBSON, Chicago, Ill. Filed Nov. 22, 1901. Serial No. 83,217. (No model.)



Claim.—1. A draft-rigging for cars, comprising a draw-bar, a draw-bar spring, a supplemental spring, means for placing said supplemental spring under stress in a direction transverse to the direction of compression of the draw-bar spring through longitudinal movement of the draw-bar, friction-producing means interposed between the draw-bar and said supplemental spring, and means acting to bring said friction-producing means into operation subsequently to the preliminary action of said supplemental spring and draw-bar spring.

2. A draft-rigging for cars, comprising a draw-bar, a draw-bar spring, a friction-block carried by the draw-bar, a complemental friction-block, a supplemental spring for holding said blocks pressed one against the other, and means acting to first place said supplemental and draw-bar springs under preliminary stress and to thereafter cause the draw-bar friction-block to move relatively to the other friction-block in the continued movement of the draw-bar.

3. A draft-rigging for cars, comprising a draw-bar, a draw-bar spring, a friction-block carried by the draw-bar, having reversely-inclined bearing-surfaces, a complemental friction-block, a supplemental spring for holding said blocks pressed one against the other, and means acting to first place said draw-bar and supplemental springs under preliminary stress and to thereafter cause the draw-bar friction-block to move relatively to the other friction-block in the continued movement of the draw-bar, the friction-blocks acting in such continued movement of the draw-bar to place the supplemental spring under stress.

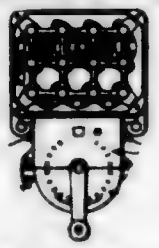
4. A draft-rigging for cars, comprising a draw-bar, a draw-bar spring, a supplemental spring which acts transversely to the direction of compression of the draw-bar spring, a friction-block carried by the draw-bar, a complemental friction-block which is pressed against said draw-bar friction-block by said supplemental spring, both of said friction-blocks being movable with the draw-bar and relatively to the supplemental spring in the preliminary stress of the supplemental and draw-bar springs, coacting parts carried by said supplemental spring and one of the friction-blocks acting to place said spring under tension in the initial movement of the draw-bar, and stops acting to limit the movement of the last-mentioned friction-block subsequently to the preliminary stress of the said supplemental and draw-bar springs and to cause the draw-bar friction-block to move relatively to the complemental friction-block in the continued movement of the draw-bar.

5. A draft-rigging for cars comprising a draw-bar, a draw-bar spring a supplemental spring which acts transversely to the direction of compression of the draw-bar spring, a friction-block carried by the draw-bar, a complemental friction-block which is pressed against said draw-bar friction-block by said supplemental spring, both of said friction-blocks being movable with the draw-bar and relatively to the supplemental spring in the preliminary stress of the supplemental and draw-bar springs, coacting parts carried by said supplemental spring and one of the friction-blocks, consisting of a roller on one part and a reversely-inclined surface on the other part acting to place said supplemental spring under tension in the initial movement of the draw-bar, and stops acting to limit the movement of the last-mentioned friction-block subsequently to the preliminary stress of the supplemental and draw-bar springs, whereby the draw-bar friction-block is caused to move relatively to its complemental friction-block in the continued movement of the draw-bar.

6. A draft-rigging for cars comprising a draw-bar, a draw-bar spring, a supplemental spring which acts transverse to the direction of compression of the draw-bar spring, a bearing-block carried by said supplemental spring, a friction-block carried by the draw-bar, a complemental friction-block which is held pressed against said draw-bar friction-block by said supplemental spring, one of said parts, to wit, the bearing-block or said complemental friction-block being provided with a roller and the other part with reversely-inclined coacting surfaces, and stops on said bearing-block for limiting the movement of the roller and the friction-block carrying the same relatively to said supplemental spring.

7. A draft-rigging for cars, comprising a draw-bar, a draw-bar spring, supplemental springs on each side of the draw-bar which act transversely to the direction of compression of the draw-bar spring, friction-blocks one on each side of and carried by the draw-bar, complemental friction-blocks which are pressed against said draw-bar friction-blocks by said supplemental springs, both sets of said friction-blocks being movable with the draw-bar and relatively to the supplemental springs in the preliminary stress of the supplemental and draw-bar springs, coacting parts carried by said supplemental springs and one set of the friction-blocks acting to strain said supplemental springs in the initial movement of the draw-bar, and stops acting to limit the movement of the last-mentioned friction-blocks subsequently to the preliminary stress of the supplemental and draw-bar springs, whereby the draw-bar friction-blocks are caused to move relatively to their complemental friction-blocks in the continued movement of the draw-bar.

704,808. ELECTRIC CONTROLLER. ARTHUR E. HOSBEIN, Philadelphia, Pa. Filed Dec. 13, 1901. Serial No. 85,716. (No model.)



Claim.—1. In an electric controller, a housing or casing having a suitable cover, and a cylinder or barrel switch carried by said cover, substantially as described.

2. In an electric controller, a housing or casing, a cover hinged thereto, and a cylinder or barrel switch journaled in said cover, substantially as described.

3. In an electric controller, a housing or casing, a plurality of contact-fingers carried thereby, horizontal disks of fireproof insulating material interposed between said fingers, a hinged cover, and a cylinder or barrel switch carried thereby and coacting with said fingers, substantially as described.

4. In an electric controller, a casing or housing having a removable cover, a suitable cylinder or barrel switch carried by said cover, contact-fingers, carried by the case and rheostat-coils comprising each a metal tube carried by said housing, a coating of fireproof insulating material encircling said tube and helically-wound rheostat-coils encircling said insulating material, substantially as described.

704,804. PROCESS OF MAKING INDOXYL, &c. BRUNO HOMOLKA and OTTO LEMMERMOEHL, Frankfort-on-the-Main, Germany, assignors to Farbwerke, vorm. Meister, Lucius & Brüning, Höchst-on-the-Main, Germany, a Corporation of Germany. Filed Sept. 4, 1901. Serial No. 74,819. (No specimens.)

Claim.—1. The herein-described process of making indoxyl, which consists in causing sodium amid to act at a high temperature preferably with suitable diluents on phenylglycinphenylglycin (phenylglycinphenylglycid), substantially as set forth.

2. The herein-described process of making indoxyl, which consists in reacting with sodium amid at a high temperature on a homologous phenylglycinphenylglycid, substantially as set forth.

704,805. ELEVATOR-BIN. JAMES A. JAMIESON, Montreal, Canada. Filed Aug. 27, 1900. Serial No. 28,254. (No model.)

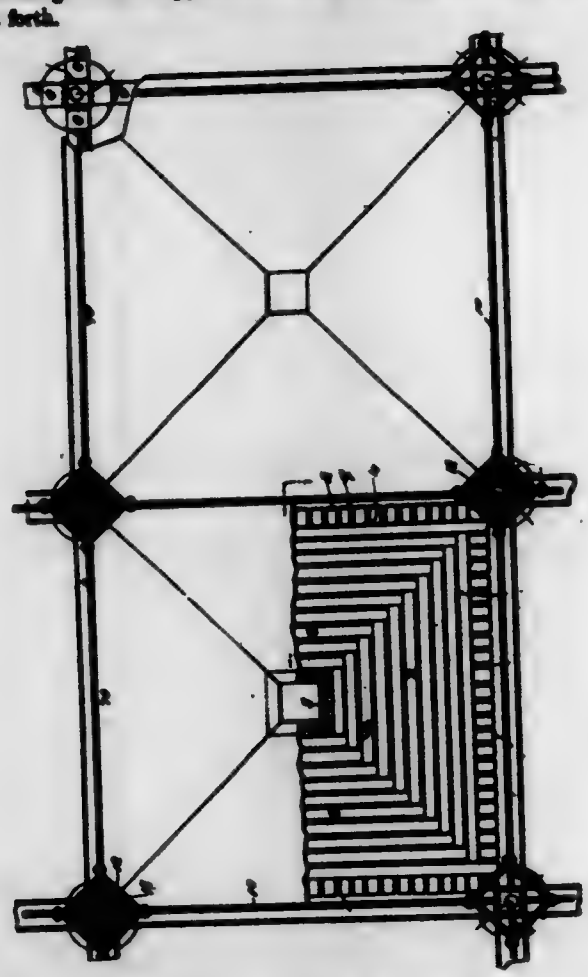
Claim.—1. A composite hopper of inverted pyramidal form the sides whereof consist of a series of metallic stays conforming to the contour of the bottom of said hopper and arranged parallel to one another; a second series of metallic stays also conforming to the contour of the bottom of said hopper and arranged parallel to one another and at right angles to said first-mentioned series of metallic stays, and a lining supported upon said two series of stays.

2. A composite hopper of inverted pyramidal form the sides whereof consist of a series of metallic stays conforming to the contour of the bottom of said hopper and arranged parallel to one another; a second series of metallic stays also conforming to the contour of the bottom of said hopper and arranged parallel to one another and at right angles to said first-mentioned series of metallic stays, and a concrete lining supported upon said two series of stays.

3. A composite hopper of inverted pyramidal form each side whereof consists of a series of metallic strips conforming to the contour of the bottom of said hopper and arranged parallel to one another and extending horizontally from side to side of said hopper, a second series of metallic strips also conforming to the contour of the bottom of said hopper and extending from bottom to top of the hopper and outside of said first-mentioned series of strips, means for connecting together the sides thus formed, and a concrete lining for said hopper, substantially as and for the purpose set forth.

4. A composite hopper of inverted pyramidal form and consisting

of four supporting-girders arranged in the form of a square; an open pyramidal casting; means for suspending said casting from said girders; a series of metallic strips conforming to the contour of the bottom of said hopper and each extending from one of said girders to the opposite girder, means for securing the ends of said strips to said girders, a second series of metallic strips also conforming to the contour of the bottom of said hopper and overlapping said first-mentioned series and extending from one of the other girders to that opposite thereto, means for connecting said last-mentioned series of strips to said last-mentioned girders, and a concrete lining for said hopper, substantially as described and for the purpose set forth.



5. A hopper-bottom of inverted pyramidal form for a bin, consisting of four supporting-girders arranged in the form of a square and having flanges on their top sides; an open pyramidal casting; means for suspending said casting from said girders; a series of metallic strips conforming to the contour of the bottom of said hopper and each extending from one of said girders to the opposite girder; the ends of said strips being bent to hook over the flanges of said girders; a second series of metallic strips also conforming to the contour of the bottom of said hopper and overlapping said first-mentioned series and extending from one of the other girders to that opposite thereto; the ends of said last-mentioned series of strips being bent to hook over the flanges of said last-mentioned girders, a concrete lining for said hopper and means for retaining said hooked ends of the strips against displacement upon the flanges of said girders, substantially as described and for the purpose set forth.

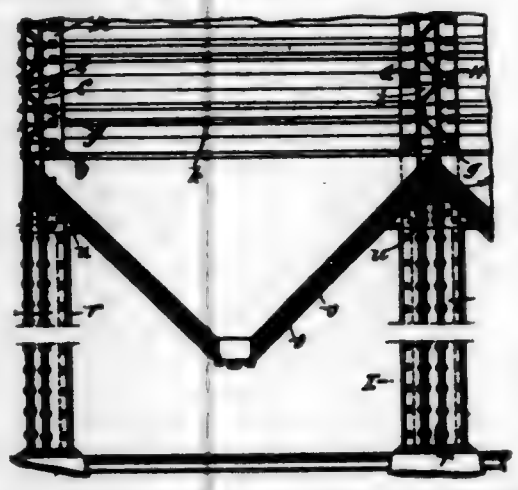
6. A hopper-bottom for a bin, consisting of four supporting-girders arranged in the form of a square and having flanges on their top sides; an open pyramidal casting; means for suspending said casting from said girders consisting of a series of metallic strips having their lower ends riveted to said casting and their upper ends bent to form hooks to take over the adjacent portion of the flange upon said girders; a series of metallic strips conforming to the contour of the bottom of said hopper and each extending from one of said girders to the opposite girder; the ends of said strips being bent to hook over the flanges of said girders; a second series of metallic strips also conforming to the contour of the bottom of said hopper and overlapping said first-mentioned series and extending from one of the other girders to that opposite thereto; the ends of said last-mentioned series of strips being bent to hook over the said last-mentioned girders, a concrete lining for said hopper and means for retaining said hooked ends of the strips against displacement upon the flanges of said girders, substantially as described and for the purpose set forth.

7. The combination with a series of girders disposed to inclose a series of hoppers, a vertical flange located at each edge of the top of each girder, each hopper consisting of an open pyramidal casting; means for suspending said casting from said girders; a series of metallic strips conforming to the contour of the bottom of said hopper and each extending from one of the inclosing girders to the opposite inclosing girder; the ends of said strips being bent to hook over the flanges of said girders; a second series of metallic strips also conforming to the contour of the bottom of said hopper and overlapping said first-mentioned series and extending from one of the other inclosing girders to that opposite thereto; the ends of said last-mentioned series of strips being bent to hook over the flanges of said last-mentioned girders, a concrete lining for said hopper, a concrete packing for retaining said hooked ends of the strips against displacement upon the flanges of said girders and a series of bins supported with their walls upon said girders, substantially as described and for the purpose set forth.

8. A series of contiguous bins consisting of a series of supporting-girders disposed to form a series of squares, a series of bin-bottoms each located within and secured at its edges to the edges of one of said squares, a series of sheet-metal walls supported upon said girders, each of said walls being of less length than its supporting-girder, and the vertical edges thereof being a short distance from one another, a series of vertically-extending corner-plates, means for connecting the side edges of said corner-plates to said sheet-metal walls a short distance from the said vertical edges thereof, and a filling for the spaces inclosed by said corner-plates, substantially as described and for the purpose set forth.

9. The combination with a series of bins for grain-elevators or the like, of supporting-columns, located beneath said bins, the corners of the bins being located over said columns, said columns consisting of a tubular metallic casing, and a concrete filler, said concrete filler extending continuously in columnar form upwardly through the corners to the top of said bins, a metallic casing for said upwardly-extending concrete portion, and means for securing said last-mentioned casing to the walls of the bins, substantially as described and for the purpose set forth.

704,806. BIN. JAMES A. JAMIESON, Montreal, Canada. Filed Nov. 6, 1901. Serial No. 81,248. (No model.)



Claim.—1. A bin comprising corner-standards, a series of horizontal sections with recessed inner sides, said sections constituting the walls of said bin, and means for rigidly connecting said horizontal sections to said corner-standards for the purpose set forth.

2. A bin comprising corner-standards, a series of horizontal sections with recessed inner sides, said sections being independent of one another and constituting the walls of said bin, and means for rigidly connecting said horizontal sections to said corner-standards, for the purpose set forth.

3. A bin comprising composite corner-standards consisting of a concrete column and a metal stay, a series of horizontal sections independent of one another and constituting the walls of said bin, and means for rigidly connecting said horizontal sections to said corner-standards, for the purpose set forth.

4. A bin comprising composite corner-standards consisting of a concrete column and a metal stay, a series of horizontal sections with recessed inner sides, said sections being independent of one another and constituting the walls of said bin, and means for rigidly connecting said horizontal sections to said corner-standards, for the purpose set forth.

5. A bin comprising composite corner-standards consisting of a concrete column and a metal stay, a series of sections of greater horizontal length than height and extending from corner-standard to corner-standard and constituting the walls of said bin, and means for rigidly connecting said horizontal sections to said corner-standards, substantially as described and for the purpose set forth.

6. A bin comprising corner-standards consisting of one or more vertical angle-irons, a filler and means for binding said angle iron or irons and said filler together; a series of horizontal wall-sections; and means for connecting the ends of said wall-sections to said standards, substantially as described and for the purpose set forth.

7. A bin comprising corner-standards consisting of one or more vertical angle-irons, a filler and means for binding said angle iron or irons and

said filler together; a series of horizontal wall-sections arranged a short distance apart; means for connecting the ends of said wall-sections to said standards; and means for closing the space between said wall-sections, substantially as described and for the purpose set forth.

8. A bin comprising corner-standards consisting of one or more vertical angle-irons, a concrete column, and means for binding said angle iron or irons and said concrete column together; a series of horizontal wall-sections arranged a short distance apart; means for connecting the ends of said wall-sections to said standards; and means for closing the space between said wall-sections, substantially as described and for the purpose set forth.

9. A bin comprising corner-standards consisting of one or more vertical angle-irons, a concrete column, and means for binding said angle iron or irons and said concrete column together; a series of horizontal wall-sections of trough form arranged a short distance apart and with their recesses facing inwardly; means for connecting the ends of said wall-sections to said standards; and means for closing the space between said wall-sections, substantially as described and for the purpose set forth.

10. A bin comprising corner-standards consisting of one or more vertical angle-irons, a filler, and means for binding said angle iron or irons and said filler together; a series of horizontal wall-sections arranged a short distance apart; means for connecting the ends of said wall-sections to said standards; and a series of strips of H cross-section disposed with the spaces between their flanges receiving the adjacent edges of said horizontal wall-sections for closing the spaces between said wall-sections, substantially as described and for the purpose set forth.

11. A bin comprising corner-standards consisting of a series of vertical angle-irons arranged a short distance apart with their apices toward a common center; a concrete column partially filling the space between said angle-irons; a series of horizontally-recessed wall-sections located with their opposite ends between the angle-irons of a pair of standards; filler-blocks filling the recesses at the ends of said wall-sections between said angle-irons; means for fastening said wall-sections and filler-blocks to said angle-irons, and means for closing the spaces between said wall-sections, substantially as described and for the purpose set forth.

12. A bin comprising corner-standards consisting of a series of four vertical angle-irons arranged a short distance apart with their apices toward a common center; a concrete column filling the spaces between the apices of said angle-irons and partially filling the spaces between the adjacent angle-irons; a series of horizontally-recessed wall-sections located with their opposite ends between the angle-irons of a pair of standards; filler-blocks filling the recesses at the ends of said wall-sections between said angle-irons; means for fastening said wall-sections and filler-blocks to said angle-irons, and means for closing the spaces between said wall-sections, substantially as described and for the purpose set forth.

13. A bin comprising corner-standards consisting of a series of vertical angle-irons arranged a short distance apart with their apices toward a common center; a concrete column partially filling the space between said angle-irons; a series of horizontal wall-sections in the form of trough-bed plates located with their opposite ends between the angle-irons of a pair of standards; filler-blocks filling the recesses at the ends of said wall-sections between said angle-irons; means for fastening said wall-sections and filler-blocks to said angle-irons, and means for closing the spaces between said wall-sections, substantially as described and for the purpose set forth.

14. A bin comprising corner-standards consisting of a series of vertical angle-irons arranged a short distance apart with their apices toward a common center; a concrete column partially filling the space between said angle-irons; a series of horizontally-recessed wall-sections located with their opposite ends between the angle-irons of a pair of standards and with said ends embedded in said concrete; filler-blocks filling the recesses at the ends of said wall-sections between said angle-irons; means for fastening said wall-sections and filler-blocks to said angle-irons, and means for closing the spaces between said wall-sections, substantially as described and for the purpose set forth.

15. A bin comprising corner-standards consisting of a series of four vertical angle-irons arranged a short distance apart with their apices toward a common center; a concrete column filling the spaces between the apices of said angle-irons and partially filling the spaces between the adjacent angle-irons; a series of horizontal wall-sections in the form of trough-bed plates located with their opposite ends between the angle-irons of a pair of standards; filler-blocks filling the recesses at the ends of said wall-sections between said angle-irons; means for fastening said wall-sections and filler-blocks to said angle-irons, and means for closing the spaces between said wall-sections, substantially as described and for the purpose set forth.

16. A bin comprising corner-standards consisting of a series of four vertical angle-irons arranged a short distance apart with their apices toward a common center; a concrete column filling the spaces between the apices of said angle-irons and partially filling the spaces between the adjacent angle-irons; a series of horizontally-recessed wall-sections located with their opposite ends between the angle-irons of a pair of standards and with said ends embedded in said concrete; filler-blocks filling the recesses at the ends of said wall-sections between said angle-irons; means for fastening said wall-sections and filler-blocks to said angle-irons, and means for closing the spaces between said wall-sections, substantially as described and for the purpose set forth.

17. A bin comprising corner-standards consisting of a series of vertical angle-irons arranged a short distance apart with their apices toward a common center; a concrete column partially filling the space between said angle-irons; a series of horizontal wall-sections in the form of trough-bed plates located with their opposite ends between the angle-irons of a pair of standards and with said ends embedded in said concrete; filler-blocks filling the recesses at the ends of said wall-sections between said angle-irons; means for fastening said wall-sections and filler-blocks to said angle-irons, and means for closing the spaces between said wall-sections, substantially as described and for the purpose set forth.

18. A bin comprising corner-standards, consisting of a series of four vertical angle-irons arranged a short distance apart with their apices toward a common center; a concrete column filling the spaces between the apices of said angle-irons and partially filling the spaces between the adjacent angle-irons; a series of horizontal wall-sections in the form of trough-bed plates located with their opposite ends between the angle-irons of a pair of standards and with said ends embedded in said concrete; filler-blocks filling the recesses at the ends of said wall-sections between said angle-irons; means for fastening said wall-sections, and filler-blocks to said angle-irons, and means for closing the spaces between said wall-sections, substantially as described and for the purpose set forth.

19. A wall-bracing standard consisting of a series of four vertical angle-irons arranged a short distance apart with their apices toward a common center; a concrete column filling the spaces between the apices of said angle-irons and partially filling the spaces between the adjacent angle-irons; filler-blocks between said angle-irons, and means securing said angle-irons and filler-blocks together.

20. A corner-standard consisting of an angle-iron; an angle-plate arranged with its sides parallel to said angle-iron; filler-blocks partially filling the spaces between the corresponding sides of the angle-iron and angle-plate, a concrete filling for the space between said angle-iron, angle-plate and filler-blocks, and means for securing said angle-iron angle-plate and filler-blocks together, substantially as described and for the purpose set forth.

21. A bin structure comprising a series of standards, a bin supported at the upper ends of said standards a series of channel-irons set on edge at the bottom of the walls of said bin, a bin-bottom, and means for supporting said bin-bottom upon said channel-irons, substantially as described and for the purpose set forth.

22. A bin structure supported upon a base or foundation and comprising a series of standards each consisting of a series of supporting-irons of different lengths, and means for securing said supporting-irons together; a bin; the longer of said supporting-irons extending from said base or foundation to the top of the bin, and the shorter of said supporting-irons extending from the said base or foundation to the under side of the bin: and means for securing said bin to said longer supporting-irons, substantially as described and for the purpose set forth.

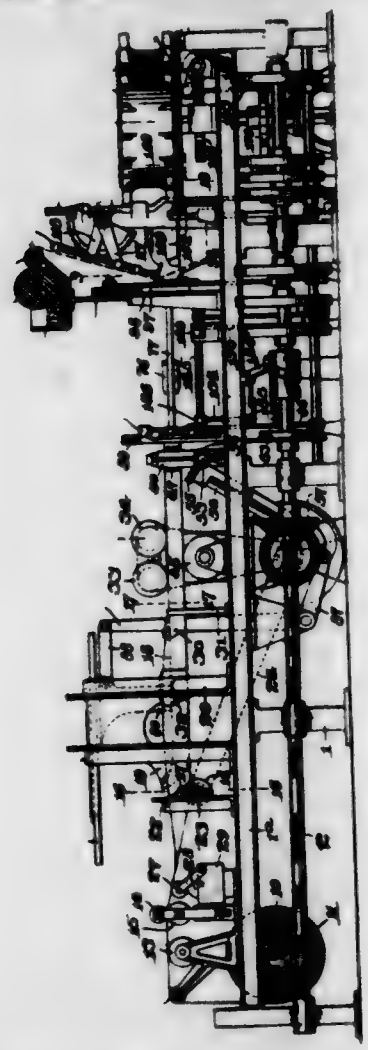
23. A bin structure supported upon a base or foundation and comprising a series of standards each consisting of a series of vertical angle-irons; a series of vertical channel-irons of less length than said angle-irons; and means for securing said angle and channel irons together; a bin; said angle-irons extending from said base or foundation to the top of the bin, and said channel-irons extending from the said base or foundation to the under side of the bin; and means for securing said bin to said angle-irons, substantially as described and for the purpose set forth.

24. A bin structure supported upon a base and comprising a series of standards each consisting of a series of vertical angle-irons, a series of vertical channel-irons of less height than said angle-irons, and means securing said angle and channel irons together; a bin consisting of walls and a hopper-shaped bottom; said angle-irons extending from said base or foundation to the top of the walls of said bins; means securing said bin-walls to the portions of said angle-irons above said channel-irons; a series of horizontal channel-irons resting upon the top of said vertical channel-irons; means securing the ends of said horizontal channel-irons to said vertical angle-irons; and means securing said bin-bottom to said horizontal channel-iron, substantially as described and for the purpose set forth.

704,807. PAPER-BAG-MAKING MACHINE. CHARLES F. KELLER, Philadelphia, Pa. Filed July 11, 1901. Serial No. 67,572. (No model.)

Claim.—1. In a machine for making paper bags, the combination of the rectangular former, means for turning a sheet or strip of paper

over and overlapping the margin of the same upon said former to form the sheet into a rectangular tube, means for applying paste to one of said margins before the same are overlapped, means for drawing forward the said paper tube upon the said former, means for severing the forward end of the said paper tube into suitable bag-blanks, devices for folding in the end portion of said blanks to form a bottom, means for pasting together the folds, and means for carrying the said blank from the former to the said folding and pasting devices, substantially as set forth.



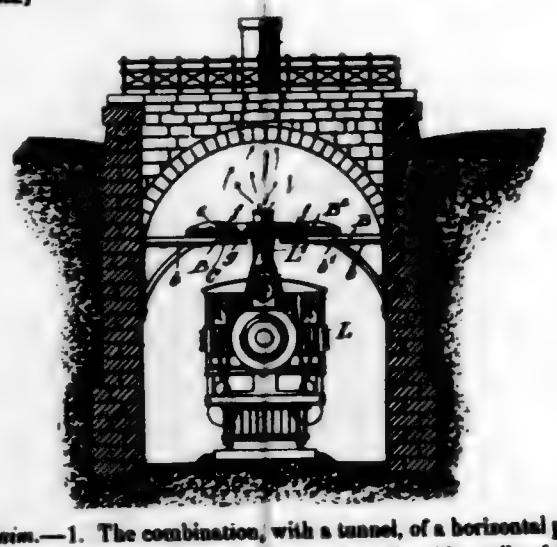
2. In a machine for making paper bags, the combination of the rectangular former, means for turning over a sheet or strip of paper and overlapping the margins of the same upon the former to impart to the sheet the form of a rectangular tube; means for applying paste to one of said margins before the same are overlapped, means for drawing forward the said tube of paper upon the former, means for severing the forward end of said tube into suitable bag-blanks, devices for folding in the forward end portion of said blanks to form the bag-bottom, means for pasting together the folds of the latter, the drum having the series of pockets in its periphery, means for imparting a predetermined intermittent rotation to said drum, the drying-pipes, or the like, beneath the said pockets, means for carrying forward the bag from the infolding and pasting devices to a pocket of said drum and means for upending the bag in said pocket, substantially as and for the purpose set forth.

3. In a machine for making paper bags, the combination of the rectangular former, means for turning a sheet or strip of paper and overlapping the margins thereof upon the said former, to impart to the sheet the form of a rectangular tube, means for applying paste to one of said margins before the same are overlapped, means for drawing forward the said paper tube upon the former, mechanism for severing the end portion of said tube into bag-blanks, the carrier for the latter, the folding devices, means for reciprocating said carrier with relation to the former and the folding devices, means respectively for collapsing and expanding said carrier at the predetermined times recited, means for applying paste to the folds of the bag-blank made by said folding devices, means for pressing together the pasted folds, and means for drying the paste thereon, substantially as set forth.

4. In a machine for making paper bags, the combination of the hollow rectangular former, devices for turning a sheet or strip of paper and overlapping the margins of the same upon said former to impart to the same the form of a rectangular tube, means for applying paste to one of said margins before the same are overlapped, means for drawing forward the said paper tube upon the former, the cutting-blades, and means for actuating the same at predetermined times to sever the forward end of the paper tube into bag-blanks, the rod extending within said former, the carrier connected to said rod, having the transversely-movable side bars, the bars upon which the same are adapted to slide, the cross-bars pivoted to the said rod and having their forward ends pivoted respectively to the said side bars of the carrier, the inclines adjacent to the forward end of the former against which the free ends of said cross-bars are adapted to ride, the knee-joint connection between said side bars of the carrier, consisting of the bars pivoted respectively to the latter and to the said rod, mechanism for imparting longitudinal reciprocations to said carrier, the series of folding-blades, and means for actuating the same at predetermined times, means for pasting together the folds made by said blades, devices for drying the paste, and means for carrying the bag from the pasting to the drying devices, substantially as set forth.

5. In a machine for making paper bags, the combination of the rectangular former, means for turning upwardly side portions of a sheet or strip of paper, consisting of the positively-driven roller, having the outwardly-beveled end flanges, located beneath and adjacent to the rear end of the former, and the superposed roller coacting with said first roller, the devices for turning over and overlapping the margins of the paper, means to the rear of said rollers, for applying a marginal line of paste to the said strip of paper, means in advance of said turn-over devices, for drawing forward the paper tube upon the former, means for cutting off the forward end of said tube to form bag-blanks, the folding devices for folding the forward end of the blank, the collapsible and expansible carrier, means for imparting longitudinal reciprocations of said carrier at predetermined times whereby the bag-blank is caused to be conveyed from the former into position to be operated upon by the folding devices, means for applying paste to the folds, the horizontal, intermittently-rotatable drum having the series of pockets in its periphery, steam drying-pipes or the like below and adjacent to said pockets, the rotatable plate located in advance of the folding and pasting devices, and means for actuating said plate to bring the same into a horizontal position to receive the folded and pasted bag and to upend the same within one of the pockets of said drum, together with means for carrying forward the bag into position to be received upon said plate, substantially as set forth.

704,808. SYSTEM FOR VENTILATING TUNNELS. JOHN KERR, New Rochelle, N. Y. Filed Dec. 4, 1901. Serial No. 84,082. (No model.)



Claim.—1. The combination, with a tunnel, of a horizontal partition formed of stationary guide-plates supported on the side walls of the tunnel, auxiliary guide-plates, spring-cushioned slide-plates provided with upright contact plates or flanges at their adjacent longitudinal edges, and keepers for said slide-plates, substantially as set forth.

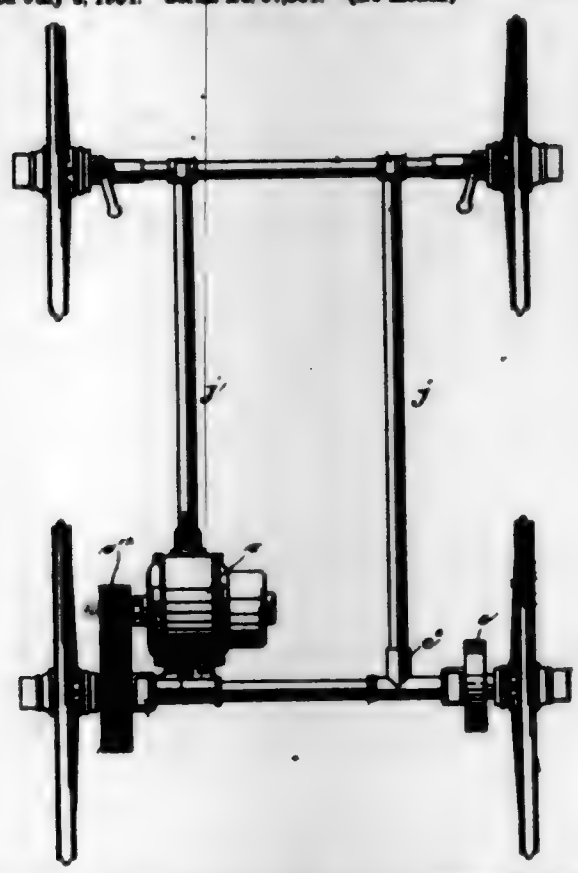
2. The combination, with a tunnel, of a horizontal partition located on the upper part of the same and composed of two longitudinal sections which are formed of stationary guide-plates, auxiliary guide-plates, spring-cushioned slide-plates guided by said auxiliary guide-plates, said slide-plates being provided with upright contact flanges or plates at their adjacent longitudinal edges, and keepers projecting from the upper auxiliary guide-plates over the spring-cushioned slide-plates, substantially as set forth.

3. The combination, with a tunnel provided with uptakes at a suitable distance from each other, of a horizontal partition formed of two longitudinal sections provided with guide-plates and spring-cushioned slide-plates, said slide-plates having upright contact plates or flanges at their adjacent longitudinal edges, and interlocking joints connecting the ends of said contact-plates, substantially as set forth.

4. In a system of ventilating tunnels, the combination, with brackets attached to the side walls of the tunnel, of horizontal main guide-plates attached to said brackets, auxiliary guide-plates supported on said main guide-plates and provided with inwardly-projecting slide-plates, and spring-cushioned slide-plates guided between the main and auxiliary

guide-plates, the adjacent edges of the side-plates being provided with upright contact flanges or plates, and interlocking joints at the adjacent ends of said contact-flanges, substantially as set forth.

704,809. AUTOMOBILE. ALVARO S. KNOX, Springfield, Ohio. Filed July 8, 1901. Serial No. 67,291. (No model.)



Claim.—1. The combination with the front and rear axles, side bars flexibly connected to said front axle, and a motor, of corner-pieces through which the rear axle extends, one of which carries said motor in connection with one of said side bars and the other rigidly attached to the other side bar, and a tube rigidly attached to said motor-carrying corner-piece and extending to and pivotally connected with the other corner-piece, substantially as and for the purpose specified.

2. The combination with the front and rear axles and side bars, body-spring couplings flexibly connecting said bars with the front axle, and a motor, of body-spring bearing corner-pieces through which the rear axle extends, one of said corner-pieces having a tube rigidly attached thereto extending to and pivotally connected with the other body-bearing corner-piece, the corner-piece having a tube attached, being pivotally attached to the side bar carrying said motor and the other being rigidly attached to the other side bar whereby the frame will adjust itself to the unevenness of the road without disturbing the adjustment of the motor, substantially as specified.

3. The combination with the front and rear axles, the motor and the frame having corner-pieces and a tube rigidly attached to one and pivotally connected to the other of said corner-pieces, as described, of antifriction-bearings on said rear axle in recesses formed in each of said corner-pieces, and a body-spring seat on each of said corner-pieces over said antifriction-bearings, substantially as specified.

4. The combination with the front and rear axles, the motor and the frame having the corner-pieces and the tube rigidly attached to one and pivotally connected to the other of said corner-pieces, as described, of antifriction-bearings on said rear axle in recesses formed in each of said corner-pieces, and a body-spring seat centrally located on each of said corner-pieces over said antifriction-bearings, said bearings being inclined toward each other, and means to tighten and adjust said bearings and tube, substantially as specified.

5. The combination with the front and rear axles and side bars flexibly connected to said front axle, and a motor, of corner-pieces through which the rear axle extends, one of which carries said motor in connection with one of said side bars, and the other rigidly attached to the other side bar, and the tube rigidly attached to said motor-carrying corner-piece and extending to and pivotally connected with the other corner-piece, supporting and holding-down springs engaging one end of said motor, said motor being pivotally connected at the other end, substantially as specified.

6. The combination with the front and rear axles and the side bars flexibly connected to the front axle and a motor connected to one of said side bars, of corner-pieces for said side bars through which the rear axle extends, to one of which said motor is rigidly attached, and a tube, also rigidly attached to said motor corner-piece, extending to and pivotally connected with the other side-bar corner-piece, said last-named corner-piece being rigidly attached to its side bar, whereby the motor-supporting corner-piece and side bar may vibrate independently of the other side bar and its corner-piece, substantially as and for the purpose specified.

7. The combination with the rear axle, of a differential gear, as described, mounted on said axle and adjacent to one of the rear wheels of the machine, one bevel-gear of said differential gear being keyed to said axle and the other bevel-gear of said differential being attached to said rear wheel, and a spring-supported motor pivoted to said axle having a driving-pinion for said differential gear, and a casing for said gears attached to the motor and its support, whereby said casing and pinion, under the vibration of the motor caused by uneven roads, are retained in their relative position, the pinion in proper mesh with said gear and the rear wheels of the machine operate independently of each other, substantially as specified.

8. The combination of the frame consisting of the front axle, the motor-carrying side bar, the motor and body supporting corner-piece with the rigidly-attached cross-tube, the opposite side bar and its body-supporting corner-piece pivotally connected to said tube, and the revolving rear axle journaled in said corner-pieces, said side bars being flexibly connected to the front axle and pivotally connected to the rear axle, substantially as and for the purpose specified.

9. The combination of the frame consisting of the front axle, the motor-carrying side bar, the motor and body supporting corner-piece with the rigidly-attached cross-tube, the opposite side bar and its body-supporting corner-piece pivotally connected to said tube, and the revolving rear axle journaled in said corner-pieces, said side bars being flexibly connected to the front axle and pivotally connected to the rear axle, and said motor being held in its normal position by holding-down and supporting springs, as described, whereby the motor vibrates independently of the vibration of its side bar, substantially as specified.

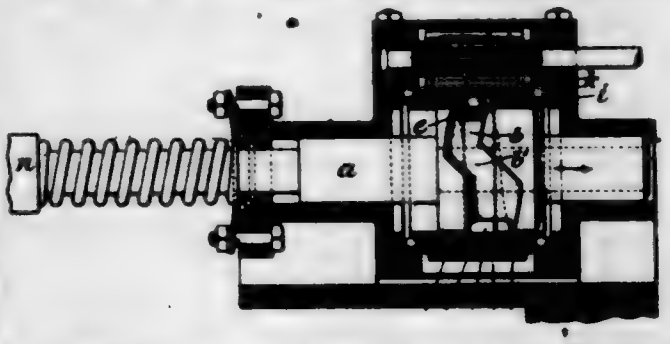
10. The combination with the front and rear axles, of side bars flexibly connected with said front axle and pivotally connected with said rear axle, said side bars also being pivotally connected, at their rear ends, with each other, by a tube through which said rear axle extends, substantially as specified.

11. The combination with the front and rear axles, of the side bars flexibly connected with said front axle and pivotally connected with said rear axle, said side bars also being pivotally connected, at their rear ends, with each other, independent of the rear axle, and a motor carried by one of said side bars and said pivoted connection, substantially as specified.

12. The combination with the front and rear axles, side bars flexibly connected with said front axle, and a motor, of corner-pieces pivoted to said rear axle, one of which carries said motor in connection with one of said side bars, and the other rigidly attached to the other side bar, said corner-pieces being pivotally connected with each other, independent of the rear axle substantially as specified.

13. The combination with the front and rear axles and side bars flexibly connected with said front axle, and a motor, of corner-pieces through which the rear axle extends, one of which carries said motor in connection with one of said side bars, said corner-pieces being pivotally connected, independent of the rear axle, supporting and holding-down springs engaging one end of said motor, said motor being pivotally connected at the other end, substantially as specified.

704,810. MECHANISM FOR CONVERTING ROTARY INTO RECIPROCATORY MOTION. BRADFORD H. LOCKE, Denver, Colo. Filed May 8, 1901. Renewed Jan. 27, 1902. Serial No. 91,409. (No model.)



Claim.—1. A device for converting rotary into reciprocatory motion, comprising a sleeve, a shaft passing freely through the sleeve, one of said parts being arranged to rotate and the other of said parts being arranged to reciprocate, one of said parts having an inclined or spiral shoulder and the other of said parts having an annular shoulder, a rolling coupler for said parts engaging said shoulders to cause longitudinal movement of the reciprocating part in one direction, and a traveler having fric-

tional engagement with the rotating part and coming in contact with said coupler to cause the same to revolve with the rotating part.

2. A device for converting rotary into reciprocatory motion, comprising a sleeve, a shaft passing through the sleeve, one of said parts being arranged to rotate and the other of said parts being arranged to reciprocate, one of said parts having an inclined or spiral shoulder and the other of said parts having an annular shoulder, a rolling coupler for said parts engaging said shoulders to cause longitudinal movement of the reciprocating part in one direction, and a partial ring having frictional engagement with the rotating part and coming in contact with said coupler to cause same to revolve with the rotating part.

3. A device for converting rotary into reciprocatory motion, comprising a sleeve having an annular groove, a shaft passing freely through the sleeve and having an inclined or spiral shoulder, a rolling coupler for said sleeve and shaft engaging said groove and said shoulder, and a partial ring in said annular groove having frictional engagement with the walls thereof and coming in contact with said coupler to cause the same to revolve with said sleeve.

704,811. **TROUSERS-FORMER.** LOUIS F. ANDERSON, Quincy, Ill. Filed Oct. 29, 1901. Serial No. 80,422. (No model.)

Claim.—1. A trousers-shaper for insertion into a trousers-leg, comprising a front shank having a V-shaped outer side for engaging the front of the trousers-leg, a rear shank provided with an adjustable bar having a V-shaped outer side for engaging the rear of the trousers-leg, and means for adjustably connecting the shanks with each other to move the front shank and the bar of the rear shank firmly in engagement with the trousers-leg, as set forth.

2. A trousers-shaper for insertion into a trousers-leg, comprising a front shank having its outer side V-shaped to firmly engage the front of the trousers-leg, a rear shank, a crease-bar movably mounted on the rear shank and adapted to engage the rear of the trousers-leg, means for adjusting the crease-bar, to and from the shank and holding it in the adjusted position, and means for connecting the shanks with each other, as set forth.

3. A trousers-shaper for insertion in a trousers-leg, comprising a front shank for engaging the front of the trousers-leg, a rear shank for engaging the rear of the trousers-leg, and means for adjustably connecting the ends of the shanks with each other, each of the said means comprising brackets detachably and adjustably secured to the ends of the shanks to extend inwardly toward each other and each provided with a nut at its end, and a right and left hand screw-rod working in the nuts of the brackets, as set forth.

4. In a trousers-shaper, the combination with shanks adjustably connected together of a crease-bar movably mounted on one of the shanks, and means for adjusting the crease-bar toward and from the shank and holding it in the adjusted position, as set forth.

5. A trousers-shaper, comprising a front shank made in sections adapted to be folded, a rear shank made in sections and adapted to be folded, a crease-bar adjustably secured to the rear shank, means for adjustably connecting the shanks with each other and comprising removable brackets on the ends of the shanks, and a right and left hand screw-rod for engaging each pair of brackets at each end of the device, as set forth.

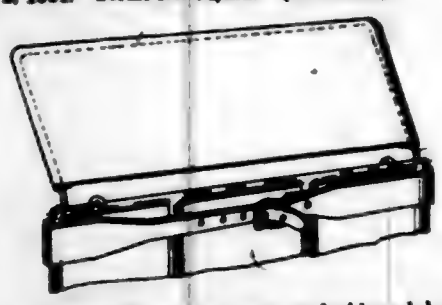
6. In a trousers-shaper, the combination with two members adjustably connected together, of a crease-bar having its ends engaging the rear member, and screws carried by the rear member intermediate of its ends and engaging the said bar, as set forth.

7. In a trousers-stretcher, the combination with two members adjustably connected together, of a crease-bar having one end loosely engaging the rear member and its other end adjustably secured to the said member, and means carried by said member intermediate of its ends for engaging said bar, as set forth.

8. In a trousers-shaper, the combination with two members adjustably connected together, of a crease-bar having a pin at one end loosely engaging the rear member and provided at its other end with a screw-rod working in an opening in the rear member, and engaged by a nut in said rear member, a plurality of screw-rods mounted in the rear member intermediate of its ends and engaging the said bar, and nuts in the member for adjusting said screw-rods, as set forth.

9. A trousers-shaper, comprising a front and rear shank, each formed of hinged sections, the front shank having a V-shaped outer edge, means for adjustably connecting the ends of the shanks together, a crease-bar having a V-shaped outer edge and movably mounted on the rear shank, and means for adjusting the crease-bar toward and from the shank and holding it in the adjusted position, as set forth.

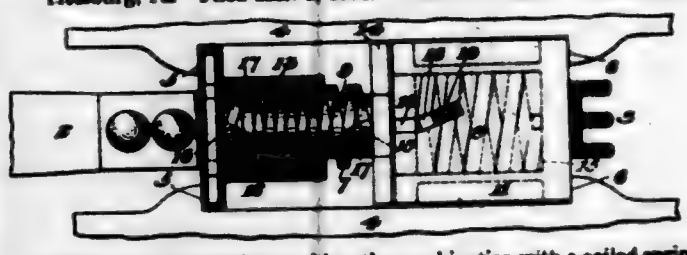
704,812. **DASHBOARD.** GLENN C. BURRELL, Hartford, Ohio. Filed Dec. 2, 1901. Serial No. 84,428. (No model.)



Claim.—1. A removable supplementary dashboard, having the angular elastic wire frame terminating in angular bracing extensions, the covering, and the fastening-straps connected to the bracing extensions, substantially as specified.

2. The combination with a fixed dashboard, of the removable supplemental dashboard consisting of the wire frame open at one side, its covering, and the securing-strap connected to the end portions of said frame, substantially as specified.

704,818. **SPRING-CUSHIONING DEVICE.** CLARENCE P. BYRNES, Pittsburg, Pa. Filed Mar. 5, 1901. Serial No. 49,915. (No model.)



Claim.—1. In a spring-cushion, the combination with a coiled spring, of mechanism for changing the diameter of at least a part of the spring, and a friction device of which the spring is a member, said friction device being brought into action by changing the diameter of the spring; substantially as described.

2. In a spring-cushion, a coiled spring, a friction-surface adjacent thereto, and a connection with the compressing member for the spring arranged to change the diameter of the spring and force a friction device into contact with its coacting surface; substantially as described.

3. In a spring-cushion, a spiral spring, a friction-surface adjacent thereto, an endwise-movable member, and a connection between said member and the spring arranged to change the diameter of the spring and a friction-device arranged to be forced against the said friction-surface by the spring when its diameter is changed; substantially as described.

4. In a spring-cushion, a coiled spring, a diameter-changing device engaging the spring, and a friction-surface arranged to frictionally contact with the spring when its diameter is changed; substantially as described.

5. In a spring-cushion, a coiled spring arranged to force friction-sur-

faces together by changing its diameter, and mechanism for changing its diameter during at least one stroke thereof; substantially as described.

6. A spring-cushion containing a coiled spring, and an inner barrel, and mechanism for contracting the spring into frictional contact with said barrel as it is compressed; substantially as described.

7. A spring-cushion containing a spring, and an outer friction-surface, and mechanism for expanding the spring on at least one stroke thereof and forcing a friction device against such surface; substantially as described.

8. A spring-cushion containing a spiral spring, a friction device arranged to be brought into action by change in diameter of the spring, and a slot-and-lug connection arranged to change the diameter of the spring upon at least one stroke thereof; substantially as described.

9. In a spring-cushion, an armor-clad spring forming one member of a friction device; substantially as described.

10. In a spring-cushion, a spiral spring, mechanism for holding the same against rotation, a friction device arranged to frictionally engage the outer faces of the spring-coils, and mechanism for actuating the friction device during at least one stroke of the spring; substantially as described.

11. In a spring-cushion, a coiled spring, mechanism for preventing rotation thereof, mechanism for changing the diameter of the spring during at least one stroke thereof, and a friction device arranged to be brought into action by changing the diameter of the spring; substantially as described.

12. In a spring-cushion, a spring forming one member of a friction device, mechanism for changing the diameter of the spring, and thereby actuating the friction device during a stroke of the spring in one direction, and mechanism for reducing the amount of friction during the stroke in the opposite direction; substantially as described.

13. In a spring-cushion, a coiled spring, mechanism for changing the diameter of the same, and a friction device arranged to engage the outer faces of the coils on the recoil-stroke, and brought into action by the change in diameter; substantially as described.

14. A spring-cushion containing a coiled spring forming one member of a friction device, and mechanism for actuating the friction device during the recoil only of the spring; substantially as described.

15. In a spring-cushion a coiled spring arranged to force friction-surfaces together by a change in its diameter, and mechanism for changing the length of the spring and simultaneously changing its diameter; substantially as described.

16. In a spring-cushion, a coiled spring, means for changing the length of the spring, mechanism for changing the diameter of the spring on its recoil-stroke, and a friction device arranged to be brought into action by said change in diameter; substantially as described.

17. A spring-cushion having a coiled spring, a friction-surface extending longitudinally of the spring-axis, and mechanism for changing the diameter of the spring and thereby forcing a friction device against said surface; substantially as described.

18. A spring-cushion containing a coiled spring, a friction device of which the spring forms a member, and means for actuating the friction device on one stroke only of the spring, the other stroke being substantially free and unretarded; substantially as described.

19. A spring-cushion containing a coiled spring concentric with the axis of the cushion, a friction device of which the spring forms a member, mechanism for compressing the spring and thereby actuating the friction device, and means for increasing the amount of friction of the recoil-stroke over that of the compression-stroke; substantially as described.

20. A spring-cushion containing a coiled spring, a friction device of which the spring forms a member, mechanism for compressing the spring, and mechanism for simultaneously actuating the friction device, the amount of friction at any point of compression of the spring being independent of the endwise pressure exerted by the spring; substantially as described.

21. A spring-cushion containing a coiled spring, mechanism for compressing the spring, means for varying the diameter of the spring at one point of the compression from that at another point of compression, and a friction device brought into action by the change in diameter; substantially as described.

22. A draft-rigging containing a spring, a friction device arranged to engage the outer faces of the spring-coils, and mechanism for changing the length of the spring and actuating the friction device on both the pulling and buffing strains; substantially as described.

23. A draft-rigging containing a coiled spring, means for compressing the spring, a friction device extending longitudinally of the spring, and located exterior to its coils, and mechanism for actuating simultaneously the spring and friction device on both the pulling and buffing strain; substantially as described.

24. A draft-rigging containing a spiral spring, a friction device arranged to be actuated by changing the diameter of the spring, and means for actuating the spring and changing its diameter on either a pulling or a buffing strain; substantially as described.

25. A spring-cushion containing a spiral spring forming a member of the friction device, and a protective cover movable with said spring; substantially as described.

26. A spring-cushion containing a spiral spring, a friction member arranged concentrically with the spring, and an incline arranged to force one of said members toward the other; substantially as described.

27. A draft-rigging having a spiral spring concentric with its axis, a friction member arranged concentric with the spring, and inclines arranged to force one of said parts toward the other on both buffing and pulling strains; substantially as described.

28. A draft-rigging having a spiral spring concentric with its axis, a friction device within and at least partially inclosed by said spring, followers arranged to compress the spring on both buffing and pulling strains, and connections independent of the endwise pressure of the spring, said connections being arranged to actuate the said friction device simultaneously with compression of the spring in either direction; substantially as described.

29. A draft-rigging having a spiral spring, a friction device within the spring, and followers arranged to compress the spring on both buffing and pulling strains, and mechanism actuated by said followers and independent of the endwise pressure of the spring, said mechanism arranged to simultaneously actuate the friction device on compression of the spring in either buffing or pulling strains; substantially as described.

30. A spring-cushion having a coiled spring interposed between the elements to be cushioned, a friction device arranged to contact frictionally with the spring, and an incline arranged to force one of said parts toward the other; substantially as described.

31. A draft-rigging having a coiled spring, a friction device arranged to frictionally contact with the spring, and inclines arranged to force one of said parts toward the other on both buffing and pulling strains; substantially as described.

32. A draft-rigging containing a pair of spring-cushions, each containing a coiled spring, a friction device arranged to frictionally contact therewith, an incline arranged to force the parts of one cushion toward each other during buffing strain, and an incline arranged to force the parts of the other cushion toward each other during pulling strain; substantially as described.

33. A draft-rigging having a pair of spring-cushions each containing a spring concentric with the axis, and friction elements, one arranged around or including the other, an incline in one cushion arranged to move one of its friction elements radially during buffing, an incline for the other cushion arranged to move one of its friction elements radially during pulling, and followers for compressing the springs; substantially as described.

34. A spring-cushion having friction elements, one arranged around or including the other, one of said elements being concentric with the axis of the cushion, a spiral spring within the cushion, a follower arranged to compress the spring, and an incline arranged to move at least one of the friction elements radially when the spring is compressed by the follower; substantially as described.

35. A spring-cushion containing friction elements, one arranged around or including the other, at least one of said elements being concentric with the axis of the cushion, a spiral spring concentric with the said axis and arranged between the follower and one of the friction elements, and an incline arranged to move at least one of the friction elements radially when the spring is compressed; substantially as described.

36. A spring-cushion having a central longitudinal friction element, another friction element arranged around or including the same, and inclines arranged to force one of said elements radially; substantially as described.

37. A draft-rigging having a longitudinal friction element central of its axis, another friction element located around or including the first, and inclines arranged to force one of said elements radially on both buffing and pulling strains; substantially as described.

38. A spring-cushion having friction elements, one located around or including the other, one of said elements being concentric with the axis of the cushion, a spiral spring also concentric with the axis, and an incline arranged to move one of the friction devices radially; substantially as described.

39. A draft-rigging having friction elements, one located around or including the other, one of said elements being concentric with the axis of the rigging, a spiral spring also concentric with the axis, and inclines arranged to move at least one of the friction devices radially on both buffing and pulling strains; substantially as described.

40. A spring-cushion having friction elements, one located around or including the other, one of said elements being concentric with the axis of the cushion, an incline arranged to move one of the friction devices radially, a coil-spring concentric with the axis of the cushion, and a follower arranged to exert a force through the spring to actuate the friction device; substantially as described.

41. A spring-cushion having a central longitudinal stem, a spiral

spring around the stem, and forming part of an including friction device, and an incline arranged to force said friction device toward the axis of the draft-rigging; substantially as described.

42. A draft-rigging having a central longitudinal friction element, another friction element arranged around or including the same, mechanism for moving said elements longitudinally of each other, and an incline arranged to force at least one of the friction elements radially in contact with the other; substantially as described.

43. A draft-rigging having a longitudinal frictional element substantially concentric with the axis of the rigging, another friction element also concentrically arranged, one of said elements being arranged around or including the other, one of the elements being radially movable, and an incline arranged to force the movable friction element in a radial direction; substantially as described.

44. A draft-rigging having a longitudinal frictional element concentric with its axis, another friction element also concentrically arranged, one of said elements being located around or including the other, an incline arranged to move at least one of the elements in a radial direction, and a coiled spring forming a part of said system; substantially as described.

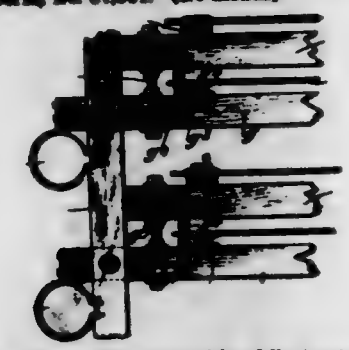
45. A draft-rigging having a main concentric coiled spring, a friction system arranged to be brought into action when said spring is compressed on buffing or pulling strain, and a device actuated by the pressure of said main draft-rigging spring, and arranged to relieve the friction device; substantially as described.

46. A draft-rigging containing a main coiled spring, and a friction system having moving parts, the said spring having a connection with one of the parts arranged to relieve the friction; substantially as described.

47. A spring-cushion containing a coiled spring, a friction device arranged to act simultaneously with the spring, and mechanism for increasing the amount of friction on the recoil-stroke over that of the strokes caused by external pressure applied to the spring; substantially as described.

48. A spring-cushion containing a main resisting coiled spring, and having also a friction system with moving parts arranged to act simultaneously with the spring, and a relief device for the friction system, said device being actuated by the endwise pressure of the main coiled spring; substantially as described.

704,814. DRYING-KILN. ARMER CAREY, Cairo, Ill. Filed Dec. 28, 1901. Serial No. 87,561. (No model.)



Claim.—1. The combination with a kiln having a series of openings in its end walls, of a plurality of horizontal shafts mounted adjacent to each end wall of the kiln, belt-wheels on the several shafts, carrier-belts passing around said belt-wheels, a vertical shaft at the discharge end of the kiln and geared with each of the horizontal shafts at that end of the kiln, clutches for connecting and disconnecting the gearing between said horizontal and vertical shafts, and operating means connected with each of the clutches and extending to the feed end of the kiln, as set forth.

2. The combination with a kiln having a series of openings in its end walls, of a plurality of horizontal shafts mounted adjacent to each end wall of the kiln, the shafts at the feed end being outside of the end wall and those at the discharge end being within the wall, sprocket-wheels on the several shafts, carrier-belts passing around said sprocket-wheels, a vertical shaft geared with each of the horizontal shafts at that end of the kiln, clutches for connecting and disconnecting the gearing between the said horizontal and vertical shafts, and operating-cords connected with the clutches and extending to the feed end of the kiln, a drive-shaft having a clutch connection with the vertical shaft, and means for operating said clutch, said means extending to the feed end of the kiln, as set forth.

3. A drying-kiln, having a plurality of endless belts running horizontally therethrough to receive the material at one end of the kiln and discharge it at the other end, and guide-racks for said belts, said guide-racks comprising upper and lower transverse beams, adjustable, relatively one to the other, and longitudinal track-rails on the said beams for the upper and lower runs of the carrier-belts, as set forth.

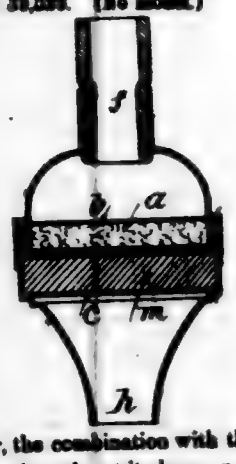
4. A drying-kiln, having a plurality of endless belts running horizontally therethrough to receive the material at one end of the kiln and discharge it at the other, and guide-racks for said belts, said guide-racks comprising upper and lower transverse beams respectively for the upper and lower runs of the carrier-belts, the upper transverse beams being adjustably sustained on the lower beams.

5. A drying-kiln, having a plurality of endless belts running horizontally therethrough to receive the material at one end of the kiln and discharge it at the other, and guide-racks for said belts, said guide-racks comprising upper and lower transverse beams and longitudinal track-rails on the said beams for the upper and lower runs of the carrier-belts, said beams having longitudinal guide-cleats on their adjacent faces, between which cleats the lower runs of the carrier-belts pass.

6. A drying-kiln, having a plurality of endless belts running horizontally therethrough to receive the material at one end of the kiln and discharge it at the other, and guide-racks for said belts, said guide-racks comprising upper and lower transverse beams and longitudinal track-rails on the beams for the upper and lower runs of the carrier-belts, the said transverse beams having longitudinal guide-cleats on their opposing faces and the carrier-belts being formed of chains with cross-bars connecting them, the chains running on the rails.

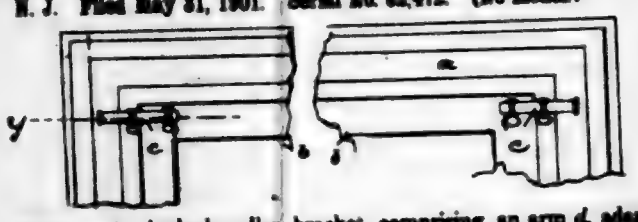
7. A drying-kiln, having means for carrying the material, and air-circulating devices in the kiln, comprising vertical conduits with horizontal distributing-tubes passing therefrom, the distributing-tubes having longitudinal openings along their inner sides.

704,815. FILTER. JULES E. CHARCH, Paris, France. Filed Dec. 11, 1900. Serial No. 39,599. (No model.)



Claim.—In a filter, the combination with the casing, the lower section thereof having an outlet-tube at its lower portion, the upper portion of the section provided with a vertical upwardly-extended right-angular surrounding flange, a perforated grating mounted on one portion of said flange with a suitable packing arranged above the same and coacting therewith, a rubber ring interposed between one portion of the packing and the upwardly-extended wall of said lower section, and a perforated grating mounted on the surrounding upper-edge portion of said ring and the upper packing; of the upper section of the casing having an inlet-tube in line with the outlet-tube and the lower portion of said upper section having a downwardly-extended right-angular surrounding flange to coact with the vertical upwardly-extended flange and with the upper grating on the ring and upper packing whereby to press and hold the packings and gratings between the two sections of the casing, substantially as specified.

704,816. SHADE-FIXTURE. EMILE L. A. CHERAU, East Orange, N. J. Filed May 31, 1901. Serial No. 62,472. (No model.)

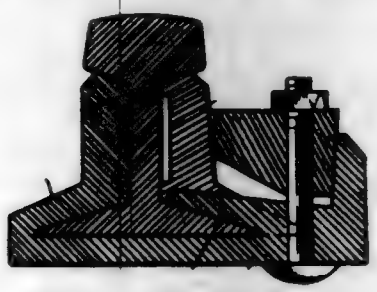


Claim.—1. A shade-roller bracket, comprising an arm *d*, adapted to project from the window-frame and providing a plate *f*, adapted to lie parallel to the window and having lugs at its upper and lower edges, a cam-roller pivoted in said lugs and forming with the plate *f*, a slideway, a slide *g*, in said slideway having one of its ends bent forward, perforated, and forming a shade-roller bearing, and an independently-adjustable shade-roller supported adjustably on the opposite end of the slide.

2. In a shade-roller bracket, the combination of a sheet-metal arm *d*, having its end bent at right angles and the opposite margins of said bent portions provided with forwardly-projecting lugs perforated to provide bearings to receive a cam-roller, said cam-roller pivoted in said lugs and having a finger-piece at one end, a strip of sheet metal adapted to slide between said cam-roller and bent portion of the stem *d*, and having one end bent and perforated to receive a shade-roller pivot, and an independ-

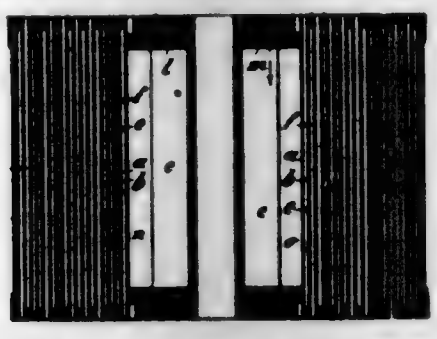
cast sheet-metal shade-roller support projecting from the sliding strip on the opposite side from the integral arm, said independent arm having a portion bent at right angles to lie against the sliding strip and provided with lugs reaching past the edges of said strip, and a cam-roller pivoted in said last-mentioned lugs.

704,817. RAILWAY-JOINT. SYLVESTER H. DEIHL, Altoona, Pa. Filed Jan. 7, 1902. Serial No. 88,709. (No model.)



Claim.—A device of the class described comprising a base having flanges at its side edges, one of said flanges including a lower portion at an acute angle to the base and an upper portion at a right angle to the base, a lip on the base adjacent to the opposite flange, a plate including a lower portion adapted to lie flush with the under face of the lip and an upper portion for engagement with the web of a rail, said lower portion having a recess to receive the lip, a wedge-block adapted to engage between the plate and the adjacent flange of the base, and a bolt passed through the base and block and having a nut for engagement with the block to draw it downwardly, between the plate and flange.

704,818. TEMPERATURE-EXCHANGING APPARATUS. JOSEPH DESHAYOUX, Paris, France, assignor to Compagnie Générale Adroky-draulique, Paris, France. Filed Dec. 6, 1901. Serial No. 84,907. (No model.)



Claim.—1. A temperature-exchanging apparatus, comprising a cylindrical member provided with two non-communicating spirally-disposed passages, each of a width substantially commensurate with the length of said cylindrical member, one of said passages being normally open at one end of said cylindrical member and the other of said passages being normally open at the other end of said cylindrical member, detachable plates for engaging the ends of said cylindrical members, thereby closing said passages at said ends, and means for admitting fluids to said passages and and for permitting the escape of the same therefrom.

2. A temperature-exchanging device, comprising a cylindrical member provided with a plurality of spirally-disposed non-communicating passages, each of a width substantially commensurate with the length of said cylindrical member, one of said passages being normally open throughout its entire length at one end of said cylindrical member and the other of said passages being normally open throughout its entire length at the other end of said cylindrical member, detachable plates for engaging the ends of said cylindrical members, thereby closing said passages at said ends, and means for admitting fluids to said passages and for permitting the escape of the same.

3. A temperature-exchanging device, comprising a cylindrical member provided with a plurality of spirally-disposed non-communicating passages, each being of a width substantially commensurate with the length of said cylindrical member, one of said passages being normally open throughout its entire length at one end of said cylindrical member, and the other of said passages being normally open throughout its entire length at the other end of said cylindrical member, detachable plates for engaging the ends of said cylindrical members thereby and closing said passages at said ends, means for admitting fluids to said passages and for permitting the escape of the same, and a substantially cylindrical core coaxial with said cylindrical member and provided with two tubular passages parallel with the axis of said member, said tubular passages communicating separately with said spirally-disposed passages.

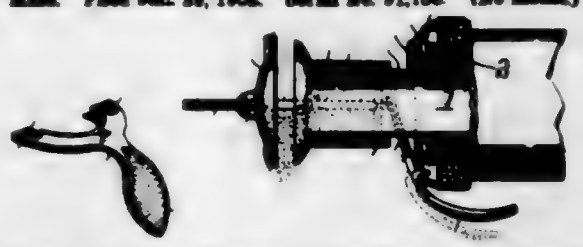
704,819. TOOL. JAMES W. EAST, Tate Springs, Tenn. Filed Apr. 14, 1902. Serial No. 102,795. (No model.)

Claim.—1. A tool-head having a handle-receiving eye and having projecting inside such eye longitudinal wedge-shaped fins tapering from one end of the eye toward the other, substantially as described.

2. A tool-head having a handle-receiving eye and having projecting inside such eye longitudinal wedge-shaped fins, substantially as specified.

3. A tool-head having a handle-receiving eye and having projecting inside such eye longitudinal wedge-shaped fins tapering from one end of the eye toward the other, in combination with a handle adapted to be forced into said eye and have its texture or fiber spread by the wedge-shaped fins to increase the frictional contact of the inclosed surface of the handle with the wall of the eye, substantially as and for the purpose set forth.

704,820. BOTTLE-STOPPER. ALEXANDER ERLUND, Attleboro, Mass. Filed Jan. 20, 1902. Serial No. 91,758. (No model.)



Claim.—1. A bottle-stopper comprising a stopper-cap having a pocket formed on its inner face; means for moving said cap to open position; and means for vibrating said cap to discharge the contents of the stopper-cap pocket.

2. A bottle-stopper comprising a stopper-tube having a pocket formed at its upper end; a stopper-cap having a pocket formed on its inner face; means for moving said cap to open position; and means for vibrating said cap to discharge the contents of the stopper-tube and stopper-cap pockets.

3. A bottle-stopper comprising a stopper-cap having a pocket formed on its inner face; means for closing said stopper-cap; means for moving said cap to open position; and means for vibrating said cap to discharge the contents of the stopper-cap pocket.

4. A bottle-stopper comprising a stopper-cap having a pocket formed on its inner face; automatic means for closing said stopper-cap; means for moving said cap to open position; and means for vibrating said cap to discharge the contents of the stopper-cap pocket.

5. A bottle-stopper comprising a stopper-cap having a pocket formed on its inner face; a spring for automatically closing said cap; an actuating-lever for moving said cap to open position; and means for vibrating said cap to discharge the contents of said stopper-cap pocket.

6. A bottle-stopper comprising a stopper-cap having a pocket formed on its inner face; a spring for closing said stopper-cap; an actuating-lever for moving said cap to open position; and means, carried by said lever, for vibrating said cap to discharge the contents of the stopper-cap pocket.

7. A bottle-stopper comprising a stopper-cap having a concave pocket formed on its inner face; a spring for closing said stopper-cap; an actuating-lever for moving said cap to open position; and means, carried by said lever, for vibrating said cap to discharge the contents of the stopper-cap pocket.

8. A bottle-stopper comprising a pivotally-pendent stopper-cap having a concave pocket formed on its inner face; a spring for closing said stopper-cap; an actuating-lever for moving said cap to open position; and means, carried by said lever, for vibrating said pivotally-pendent cap and discharging the contents of the stopper-cap pocket.

9. A bottle-stopper comprising a stopper-tube having a circumferential pocket formed at its upper end; a stopper-cap having a pocket formed on its inner face seated on said stopper-tube; means for moving said stopper-cap to open position; and means for vibrating said cap to discharge the contents of the stopper-tube and stopper-cap pocket.

10. A bottle-stopper comprising a stopper-tube having a concave circumferential pocket formed at its upper end; a stopper-cap having a

concave pocket formed on its inner face seated on said stopper-tube; means for moving said stopper-cap to open position; and means for vibrating said cap to discharge the contents of the stopper-tube and stopper-cap pockets.

11. A bottle-stopper comprising a stopper-tube having a concave circumferential pocket formed at its upper end; a pivotally-pendent stopper-cap having a concave pocket formed on its inner face seated on said stopper-tube; means for moving said stopper-cap to open position; and means for vibrating said cap to discharge the contents of the stopper-tube and stopper-cap pockets.

12. A bottle-stopper comprising a stopper-tube having an outwardly-projecting concave flange at its upper end; a stopper-cap having a concave inner face seated on said flange; means for holding said cap normally in closed position; means for opening said cap; and means for vibrating said cap to discharge the contents of the stopper-tube and stopper-cap pockets.

13. A bottle-stopper comprising a stopper-tube; a sliding sleeve mounted thereon; a supporting-yoke carried by said sleeve; and a stopper-cap pivotally pendent from said yoke.

14. A bottle-stopper comprising a stopper-tube; a sliding sleeve mounted thereon; a supporting-yoke carried by said sleeve; a stopper-cap having a pocket formed on its inner face supported by said yoke; means for holding said cap normally in closed position; means for moving said sleeve and yoke and opening said cap; and means for vibrating said cap to discharge the contents of the pocket.

15. A bottle-stopper comprising a stopper-tube; a sliding sleeve mounted thereon; a supporting-yoke carried by said sleeve; a stopper-cap having a concave pocket formed on its inner face pivotally pendent from said yoke; automatic means for holding said cap normally closed; means for moving said sleeve and yoke and opening said cap; and means for vibrating said cap to discharge the contents of the pocket.

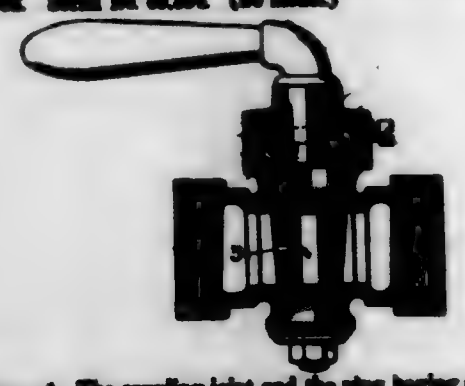
16. A bottle-stopper comprising a stopper-tube; a sliding sleeve mounted thereon; a supporting-yoke carried by said sleeve; a stopper-cap pivotally pendent from said yoke to close said tube; and a stopper-cap-actuating lever pivoted to said tube and engaging said yoke.

17. A bottle-stopper comprising a movable supporting-yoke; a stopper-cap pivotally pendent from said yoke; and an actuating-lever engaging said movable yoke to open said stopper-cap.

18. A bottle-stopper comprising a stopper-tube; a sliding sleeve mounted thereon; a supporting-yoke the limbs of which are secured to said sleeve; a stopper-cap pivotally pendent from said yoke; a spring normally holding said sleeve, yoke, and cap in closed position; and a forked stopper-actuating lever pivoted to said stopper-tube and engaging the limbs of said yoke.

19. A bottle-stopper comprising a stopper-tube having a concave flange to form a circumferential pocket at its upper end; a sliding sleeve mounted on said tube; a supporting-yoke the limbs of which are secured to said sleeve; a stopper-cap having a concave inner face seated on said stopper-tube flange; a spring housed between said tube and sleeve to hold said cap normally closed; and a forked stopper-actuating and stopper-vibrating lever having serrated ends engaging said supporting-yoke.

704,821. PLUG AND COUPLING FOR WATER OR STEAM PIPES. ISAAC H. GLAUBER and JOSEPH H. GLAUBER, Cleveland, Ohio. Filed Jan 15, 1902. Serial No. 89,894. (No model.)



Claim.—1. The coupling-joint and the plug having an integral cap overhanging the plug-seat, a collar within said cap constructed to limit the rotation of the plug, a stop on the plug to engage said collar and means to lock said collar rotatably to said plug, substantially as described.

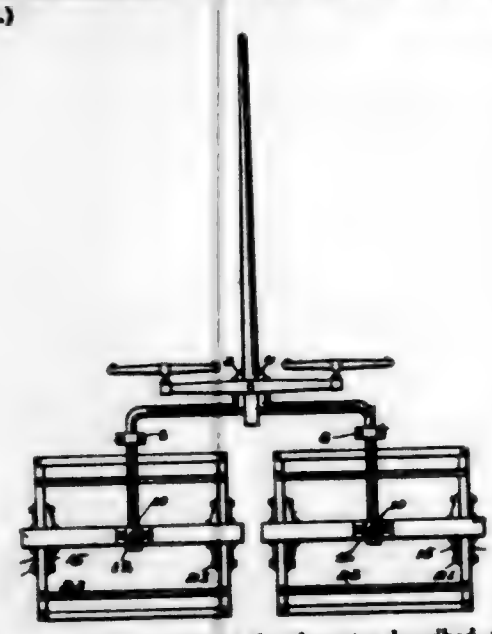
2. The coupling-joint and the plug, a collar engaged to rotate with the plug and the said collar and joint constructed to limit the rotation of the plug and the said plug having an integral cap, substantially as described.

3. The coupling-joint having a plug-seat and a shouldered projection at the top of said seat, a plug having an integral cap about its top and a collar within the cap constructed with a recess to engage said shouldered projection, and a pin through said cap and plug to engage said collar and limit the rotation of the plug, substantially as described.

4. The coupling-joint having a seat for a plug and an upward projection at the top of said seat, a plug in said joint and a free collar about the top thereof having a recess corresponding to said projection and provided with a notch on its top, and a threaded stop extending through the plug into engagement with said notch, substantially as described.

5. The coupling-joint and the plug therein, a collar constructed to have a limited rotation on said joint and having a set of notches on its top, and a screw engaged through the plug in one of said notches, and the said plug having an integral cap overlapping said collar, substantially as described.

704,822. COTTON-CHOPPER AND CLOD-CRUSHER. MARTIN B. GEORGE, Vicksburg, Miss. Filed Oct. 3, 1901. Serial No. 77,431. (No model.)



Claim.—1. In a machine of the character described, the combination with a hub-plate, a central annular lug integral with said plate, pins secured to the plate a short distance from the periphery of said lug, of spring-spokes bent at right angles at their lower ends, a loop formed in the extreme lower end of said spokes, whereby the spokes are secured to said pins.

2. In a device of the character described, the combination with a hub-plate, a central annular lug integral with said plate, pins secured to said plate a short distance from the periphery of the central annular lug, spring-spokes bent at right angles near their lower ends and secured at their extreme lower end to said pins, whereby the right-angled portion rests upon the periphery of the central annular lug, a second hub-plate bolted to the first-named hub-plate, and flat resilient steel knives secured to the outer ends of said spokes.

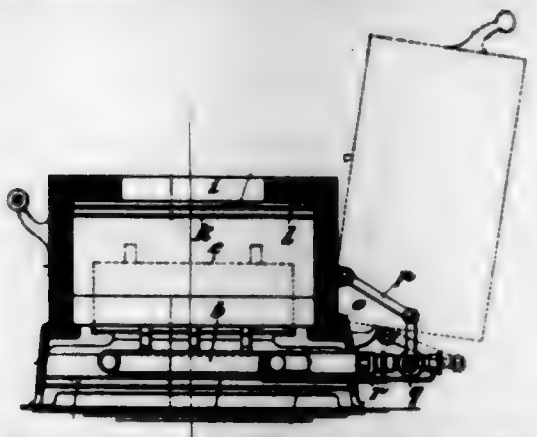
704,823. DRAPER. WALTER T. GORDON, Juniper, Oreg. Filed Apr. 22, 1902. Serial No. 104,103. (No model.)

Claim.—1. The combination of a bolt, a slot arranged on the bolt, and having an aperture extending from its outer to its inner side, and tapered or reduced in size to said inner side, a correspondingly-tapered connecting device arranged in said aperture, and extending throughout the thickness of the slat, and secured at its inner end to the bolt.

2. The combination of a bolt, a slat arranged on the bolt, and having an aperture extending from its outer to its inner side, and tapered or reduced in size to said inner side, and the connection comprising the hollow member exteriorly tapered to its inner end and open at its inner and outer ends; said hollow member being arranged in the said aperture of the slat and extending throughout the thickness of the latter, and a rivet having a head disposed at the inner side of the bolt, and a stem passed through the bolt and into the inner end of the hollow member, and secured in said inner end of the hollow member.

3. The combination in a draper or the like, of a run or runs, a bolt, slats arranged on the bolt so as to travel against the run or runs, and having apertures tapered or reduced in diameter toward the bolt, and correspondingly-tapered connecting devices arranged in said apertures of the slats and secured to the bolt.

704,824. MUFFLE-FURNACE FOR IRONS. HUGO KRETSCHY, Frankfort-on-the-Main, Germany. Filed Apr. 30, 1902. Serial No. 105,162. (No model.)



Claim.—1. A muffle-furnace comprising a muffle providing a combustion-chamber, a guiding-plate disposed within the muffle and spaced from the walls thereof; said guiding-plate being approximately arch-shaped in cross-section and provided with restricted outlet-apertures in the crown thereof, a burner situated underneath said guiding-plate, and means for supporting the article to be heated between the burner and the guiding-plate.

2. A muffle-furnace comprising a muffle having an aperture in the crown thereof and providing a combustion-chamber, an arched guiding-plate provided with restricted outlet-apertures in the crown thereof and disposed within the muffle and spaced from the walls thereof, a burner situated underneath said guiding-plate, means for supporting the article to be heated between the burner and the guiding-plate, and a baffle-plate situated between the guiding-plate and the aperture in the muffle.

3. A muffle-furnace comprising a muffle providing a combustion-chamber, an arched guiding-plate provided with restricted apertures in the crown thereof and disposed within the muffle and spaced from the walls thereof, a burner situated underneath said guiding-plate, means for supporting the article to be heated between the burner and the guiding-plate, a shutting-off plate having an aperture and located underneath the burner, and a guiding-plate underneath the shutting-off plate.

4. A muffle-furnace comprising a hinged muffle providing a combustion-chamber, a burner situated in the muffle, a supply-pipe leading to the burner and having a valve, and means for communicating motion from the muffle to the valve in the supply-pipe; said valve being open when the muffle is in operative relation with respect to the burner and closed when the muffle is moved away from the burner.

5. A muffle-furnace comprising a hinged muffle providing a combustion-chamber, a burner situated in the muffle, a supply-pipe leading to the burner and having a valve, means for communicating motion from the muffle to the valve in the supply-pipe, and a small tube extending from the supply-pipe in rear of the valve to the burner.

704,825. RED AZO DYE. WILHELM HERBERTZ and OTTO BERNERT, Berlin, Germany, assignors to Action Gesellschaft für Anilin Fabrikation, Berlin, Germany. Filed Mar. 3, 1902. Serial No. 96,442. (Specimens.)

Claim.—1. The herein-described new azo dyestuffs which are sodium salts of acids having the formula:

$$C_6H_2\begin{cases}(1)\ OH\\(2)\ N{=}N{-}C_6H_3\\(4)\ NO_2\\(6)\ COOH\end{cases}\qquad\begin{cases}(1)\ CH_3\\(2)\ NH_2\\(4)\ NH{-}SO_2{-}C_6H_4{-}CH_3\end{cases}$$

(in which X means a substituting group, and R and R' hydrogen atoms, which may be replaced by alkyl radicals) and which are obtained by combining diazotized para-nitro-ortho-amido-salicylic acid with a para-substituted meta-amido-alphyl-sulfamid; said dyestuffs forming in the dry state reddish-brown powders, readily soluble in warm water, forming reddish-brown solutions; the aqueous solutions turning deep red on addition of caustic-soda lye and assuming a light orange-red coloration on addition of hydrochloric acid; the dyestuff dissolving readily in concentrated sulfuric acid to dark yellowish-red solutions, and in alcohol to yellowish-red solutions; the dyes producing on wool with the aid of chromium mordants yellowish-red shades of great intensity and fastness.

2. The herein-described new dyestuff, which is a sodium salt of an acid having the formula:

$$C_6H_2\begin{cases}(1)\ OH\\(2)\ N{=}N{-}C_6H_3\\(4)\ NO_2\\(6)\ COOH\end{cases}\qquad\begin{cases}(1)\ CH_3\\(2)\ NH_2\\(4)\ NH{-}SO_2{-}C_6H_4{-}CH_3\end{cases}$$

and which is obtained by combining diazotized para-nitro-ortho-amido-salicylic acid with ortho-amido-para-toluol-para-sulfamido-toluol; said dye forming in the dry state a reddish-brown powder with metallic luster, readily soluble in warm water, forming a reddish-brown solution; the aqueous solution turning deep red on addition of caustic-soda lye and assuming a light orange-red coloration on addition of hydrochloric acid; the dyestuff dissolving readily in concentrated sulfuric acid to a dark yellowish-red solution, and in alcohol to a yellowish-red solution; the dye producing on wool with the aid of chromium mordants yellowish-red shades of great intensity and fastness.

704,826. RED AZO DYE. WILHELM HERBERTZ and OTTO BERNERT, Berlin, Germany, assignors to Action Gesellschaft für Anilin Fabrikation, Berlin, Germany. Filed Mar. 3, 1902. Serial No. 96,441. (Specimens.)

Claim.—1. The herein-described new azo dyestuffs which are sodium salts of acids having the formula:

$$C_6H_2\begin{cases}(1)\ OH\\(2)\ N{=}N{-}C_6H_3\\(4)\ NO_2\\(6)\ NO_2\end{cases}\qquad\begin{cases}(1)\ CH_3\\(2)\ NH_2\\(4)\ NH{-}SO_2{-}C_6H_4{-}CH_3\end{cases}$$

(in which Y means a hydrogen atom, which may be replaced by a nitro group, X a substituting group, and R and R' hydrogen atoms which may be replaced by alkyl radicals) and which are obtained by combining the diazo compound of a nitro derivative of ortho-amidophenol with a para-substituted meta-amido-alphyl-sulfamid; said dyestuffs forming in the dry state reddish-brown powders, soluble in water to orange-red solutions; the aqueous solutions turning somewhat more yellowish on addition of caustic-soda lye and separating red precipitates on the addition of mineral acids; the dyestuffs dissolving readily in concentrated sulfuric acid to yellow solutions and in alcohol to red solutions; the dyes producing on wool with the aid of chromium mordants bordeaux-red shades of great intensity and fastness.

2. The herein-described new dyestuff which is a sodium salt of an acid having the formula:

$$C_6H_2\begin{cases}(1)\ OH\\(2)\ N{=}N{-}C_6H_3\\(4)\ NO_2\\(6)\ NO_2\end{cases}\qquad\begin{cases}(1)\ CH_3\\(2)\ NH_2\\(4)\ NH{-}SO_2{-}C_6H_4{-}CH_3\end{cases}$$

and which is obtained by combining diazotized picramic acid with ortho-amido-para-toluol-para-sulfamido-toluol; said dye forming in the dry state a reddish-brown powder, which dissolves in water to an orange-red solution; the aqueous solution turning more yellowish on addition of caustic-soda lye and separating a red precipitate on the addition of a mineral acid; the dye dissolving easily in concentrated sulfuric acid forming a yellow solution; dissolving in alcohol to a red solution; the dye producing on wool with the aid of chromium mordants intense bordeaux-red shades of great intensity and fastness.

704,827. HAT-HOOK. ROBERT W. HIGGINS, Cortland, N. Y. Filed Aug. 17, 1901. Serial No. 72,370. (No model.)

Claim.—1. A hanger formed from a single piece of wire, one end of which is formed into a closed supporting-loop and the other end is formed into a clamp having two members, one member being a figure-8-shaped clamping member and the other clamping member being the straight portion of the wire below the supporting-loop, substantially as described.

2. A hanger formed from a single piece of wire, one end of which is formed into a supporting-loop, a straight portion below the loop, and two loops in the remaining portion of the wire, one upon each side of the straight portion, the portion of wire between said two loops crossing the straight portion at an angle and forming therewith a clamp for holding the article to be supported, substantially as described.

704,828. BOTTLE-WASHING BRUSH. ROBERT HOSKINS, Brooklyn, N. Y. Filed Dec. 17, 1901. Serial No. 86,226. (No model.)

Claim.—1. A bottle-washing brush comprising a brush portion, and a curved tubular and perforated body or back adapted to move to a position out of normal while entering it in a bottle, and to move to normal

position when inserted, to engage the brush material against the inner surface of the bottle-body, substantially as specified.

2. A bottle-washing brush having a tubular curved back or body portion consisting of two sections, and a flexible connection between the sections, substantially as specified.

3. A bottle-washing brush having a tubular and perforated curved back or body portion, consisting of two sections, and a spring arranged within the sections and having one end connected to one section and the other end connected to the other section, substantially as specified.

4. A bottle-washing brush having a tubular perforated back or body portion, consisting of two sections, ferrules secured to the sections, and a spring arranged within the ferrule portions and secured thereto, substantially as specified.

5. A bottle-washing brush having a tubular perforated back or body portion, consisting of two sections, a flexible connection between the sections, and metal straps having swinging connection with one of the sections and sliding and swinging connection with the other of the sections, substantially as specified.

6. A bottle-washing brush comprising a tubular body portion open at one side, and a rubber brush seated in said opening and having shoulders for engaging against the inner surface of the body and shoulders for engaging against the outer surface of the body, substantially as specified.

704,829. METAL FRAMEWORK FOR BUILDINGS. EDWARD HUBER, Marion, and ALFRED MILLIKEN, Toledo, Ohio. Filed Mar. 4, 1902. Serial No. 96,659. (No model.)

Claim.—1. In a metal framework for buildings, blocks fitted on the sides of the girders to form supports for columns between floors, substantially as shown and described.

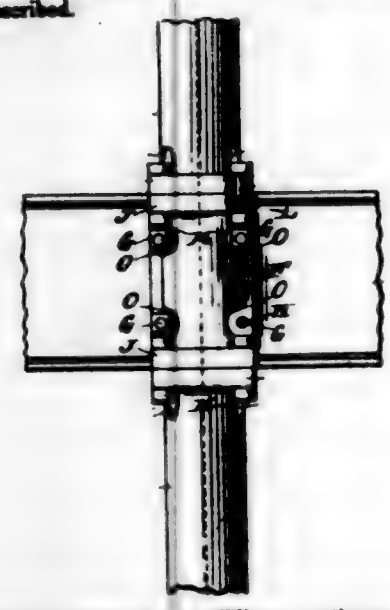
2. In a metal framework for buildings, blocks fitted on the sides of the girders, and projecting flanges at the extremities of said blocks to form connecting-surfaces for the supporting-columns, substantially as shown and described.

3. In a metal framework for buildings, blocks fitted on and following the contour of the girders to form supports for the columns between floors, substantially as shown and described.

4. In a metal framework for buildings, blocks fitted on and following the contour of the girders, and flanges at the extremities of the blocks to form connecting-surfaces for the supporting-columns, substantially as shown and described.

5. In a metal framework for buildings, continuous I-beam girders, columns to support said girders intermediate of their ends, and blocks to fit on each side of said girders so formed as to provide supports for the crowns and bases of said columns, substantially as shown and described.

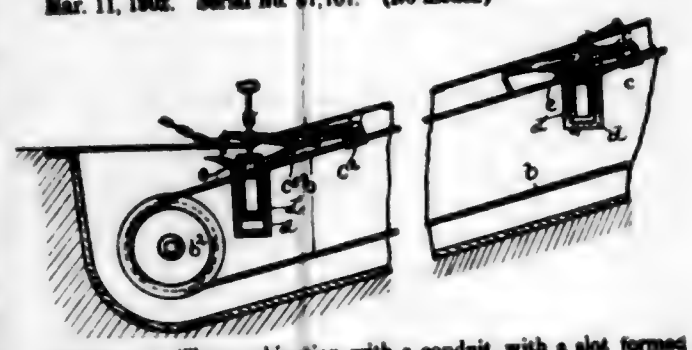
6. In a metal framework for buildings, continuous I-beam girders, columns to support said girders intermediate of their ends, blocks to fit on each side of said girders, and projecting flanges on said blocks to form surfaces to connect with the crown or base of said columns, substantially as shown and described.



7. In a metal framework for buildings, continuous I-beam girders, blocks secured to each side of said girders, a projecting flange at each end of said block having a recess to receive the flange on one side of said I-beam, and a column secured to the flange on said block, substantially as shown and described.

8. In a metal framework for buildings, continuous I-beam girders, columns to support said girders, blocks to fit on each side of said girders shaped to represent continuations of said columns, and a projecting flange at each end of said block having a recess to receive the flange on said I-beam, the flanges on said blocks forming connecting-surfaces for said columns, substantially as shown and described.

704,880. CABLE MECHANISM FOR HAULING LOADS UP INCLINED SURFACES. WILLIAM J. JACKMAN, Cleveland, Ohio. Filed Mar. 11, 1902. Serial No. 97,707. (No model.)



Claim.—1. The combination with a conduit, with a slot formed in its upper surface, a cable operatively mounted in said conduit, and means for operating said cable, of an arm pivotally secured on said cable, a gripping device arranged on one end of said arm, movable devices arranged within said conduit and lying without the path of said arm, means for causing said devices to come into engagement with said arm, so as to cause said gripping device to rise through the slot in said conduit, and stationary devices arranged in said conduit and lying without the path of said arm, when the said arm is in its normal position within the said conduit, and arranged to engage with said arm when said arm is in its raised position, for the purpose set forth.

2. The combination with a conduit, with a slot formed in its upper surface and extending longitudinally thereof, a cable operatively mounted in said conduit and means for operating said cable, of gripping devices permanently secured to said cable and normally lying entirely within said conduit, cam devices mounted within said conduit at predetermined points and arranged so that when the said gripping devices come in contact therewith the said gripping devices will rise through the slot in the said conduit, for the purpose set forth.

3. The combination with a conduit, with a slot formed in its upper surface and extending longitudinally thereof, a cable operatively mounted in said conduit and means for operating said cable, of gripping devices each of said gripping devices comprising a bracket extending longitudinally of the cable and rigidly secured thereto, a lever pivoted to the free end of said bracket, a hook formed on one end of said lever, and devices arranged at predetermined points within the conduit, and adapted to engage the said lever so as to cause the hook on the end thereof to rise through the slot in the said conduit, for the purpose set forth.

4. The combination with a conduit, with a slot formed in its upper surface and extending longitudinally of the said conduit, a cable operatively mounted in said conduit and means for operating said cable, of engaging or gripping devices permanently secured to said cable, each of said gripping devices comprising a bracket rigidly secured to said cable, a lever pivoted to said bracket, a hook formed on one end of said lever and a roller on the other end and cam devices arranged at predetermined points within said conduit and adapted to engage the said roller so as to depress the roller-carrying end of the lever and elevate the hook-carrying end of the said lever, substantially as described and for the purpose set forth.

5. The combination with a conduit, with a slot formed in its upper surface and extending longitudinally thereof, a cable operatively mounted in said conduit and means for operating said cable, of gripping devices each of said gripping devices comprising a bracket rigidly secured to said cable, a lever pivoted to the free end of the said bracket and a hook formed on one end of said lever, and cam devices located within said conduit and arranged below the path of said gripping devices and means for moving said cam devices into the path of the said gripping devices, substantially as described and for the purpose set forth.

6. The combination with a conduit, with a slot formed in the upper surface and extending longitudinally thereof, a cable operatively mounted in said conduit and means for operating said cable, of gripping devices each of said devices comprising a bracket rigidly secured to said cable, a lever pivoted on said bracket, a hook formed on one end of said lever, and a roller mounted on the other end of said lever, guideways located within said conduit, frames arranged in said guideways, cams secured to said frames and normally lying without the path of said roller on said lever, and means for lifting said frames in said guideways so as to bring said cams within the path of said roller, substantially as described and for the purpose set forth.

7. The combination with a conduit, with a slot formed in its upper surface and extending longitudinally thereof, a cable operatively mounted in said conduit and means for operating said cable, of gripping devices each of said devices comprising a bracket rigidly secured to said cable, a lever pivoted on said bracket, a hook formed on one end of said lever, and a roller mounted on the other end of said lever, vertical guideways located within said conduit, frames arranged in said guideways, cams secured to said frames and normally lying without the path of said roller on said lever, and a chain secured to said frames and adapted to lift said frames in the said guideways, substantially as described and for the purpose set forth.

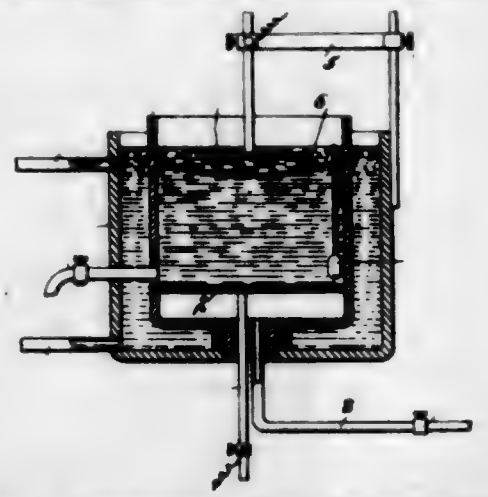
8. The combination with a conduit, with a slot formed in its upper surface, a cable operatively mounted in said conduit and means for operating said cable, of gripping devices pivotally secured to said cable and normally lying entirely within said conduit, a movable cam arranged within said conduit and normally lying without the path of said gripping device, for causing said gripping device to rise through the slot in the said conduit when said cam is brought into the path of said gripping device, and a stationary device, for automatically disengaging said gripping device from a load, arranged within the conduit and lying without the path of the gripping device when in its normal position within the conduit, and lying within the path of and adapted to engage with said gripping device when said gripping device is in its raised position, for the purpose set forth.

9. The combination with a conduit, with a slot formed in its upper surface and extending longitudinally of said conduit, a cable operatively mounted in said conduit and means for operating said cable, of gripping devices normally lying entirely within said conduit, means for causing said gripping devices to rise through the slot in the said conduit so as to engage with a load above the said conduit, a stationary cam mounted within said conduit and arranged so as to lie below the horizontal frame of the said gripping device when in its normal position, and to contact with the said gripping device when the said gripping device is in engagement with a load, substantially as described and for the purpose set forth.

10. The combination with a conduit with a slot formed in its upper surface, a cable operatively mounted in said conduit, and means for operating said cable, of a gripping device pivotally secured to said cable and normally lying within said conduit, frames arranged within said conduit without the path of said gripping device, cams arranged on said frames, and means for actuating said frames, so as to cause the said cams to lie within the path of said gripping device, for the purpose set forth.

11. The combination with a conduit, a cable-slot formed in said conduit, a cable operatively mounted in said conduit and means for operating said cable, of a gripping device pivotally secured to said cable and normally lying within said conduit, a movable frame arranged within said conduit, without the path of the said gripping device, a cam arranged on said frame, means for actuating said frame so as to bring said cam within the path of the said gripping device, a stationary frame arranged within said conduit, a cam mounted on said frame and lying without the path of said gripping device, when said gripping device is in its normal position within the conduit, and arranged to engage with the said gripping device, when the said gripping device is in its raised position, for the purpose set forth.

704,881. PROCESS OF MANUFACTURING SULFURIC ACID FROM SULFUR DIOXID IN AQUEOUS SOLUTION BY ELECTROLYSIS. CHARLES R. JACOBS, East Orange, N. J., assignor to the Ampere Electro-Chemical Company, Jersey City, N. J., a Corporation of New Jersey. Filed June 1, 1901. Serial No. 62,711. (No specimens.)



Claim.—1. The process of making sulfuric acid, which consists in passing sulfur dioxid through a porous anode and setting free the oxygen of water by electrolysis upon said anode.

2. The process of making sulfuric acid by electrolysis, which consists in setting free the oxygen of water upon a porous anode and forcing sulfur dioxid through said anode under pressure.

3. The process of making sulfuric acid which consists in supplying sulfur dioxid through the anode of an aqueous electrolytic bath, setting free the oxygen of the water at the anode by electrolysis of the bath, maintaining at the cathode of such bath a current density sufficient to prevent access of sulfur dioxid to the cathode, and causing the hydrogen to escape from the cathode without acting on the sulfur dioxid.

4. The process of producing sulfuric acid consisting in passing sulfur dioxid into an aqueous electrolytic bath, maintaining at the cathode of said bath in proximity to the anode a current density greater than the current density at the anode whereby rapid escape of hydrogen at the cathode is effected.

5. The process of producing sulfuric acid, which consists in supplying sulfur dioxid at the anode of an aqueous electrolytic bath, passing the electric current through said bath in an upward direction to oxidize the sulfur dioxid in the lower region of the bath and retain the product of oxidation remote from the cathode.

704,882. CHECK-LOCK FOR MINE-CARS. LEVI J. JONES, Meyersdale, Pa. Filed Mar. 3, 1902. Serial No. 96,468. (No model.)

Claim.—1. The combination with a car having an opening in its body portion above the floor thereof, of a check or similar token, a ring connected to the check or token and inserted through the opening in the side of the car, and a hook pivoted to the side of the car and swinging in a vertical plane downwardly to engage said ring and lock the same in place, substantially as described.

2. The combination with a car having an opening in its body portion above the floor of a check or token, and a fastening for uniting the check or token to the body of the car, said fastening consisting of two elements one of which projects through the opening in the body of the car and is connected to the check or token, and the other of which is separate and distinct from the first-named element to engage the same by downward movement and thus lock the check or token in place, substantially as and for the purpose set forth.

704,888. BAG-HOLDER. ARTHUR D. JOHNSON, Clare, Mich. Filed Nov. 21, 1901. Serial No. 83,142. (No model.)

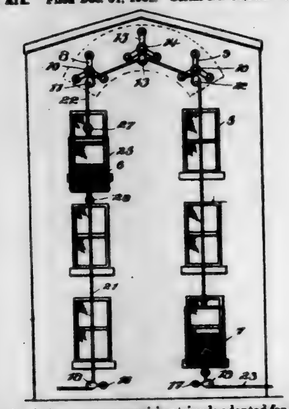
Claim.—1. In a bag-holder, the combination with a suitable bag-

mouth-supporting frame, of jaws pivoted to said frame and adapted to engage the opposite sides thereof and clamp the neck of the bag thereto, each jaw being longitudinally expansible to compensate for the bunching of the necks of bags of different thicknesses of material of which the necks are formed, substantially as set forth.

2. In a bag-holder, the combination with a suitable bag-mouth-supporting frame, of jaws pivoted to said frame and adapted to engage the opposite sides thereof, said jaws being formed intermediate their pivoted ends with springs to permit of the expansion of said jaws and to serve the additional function of handles by means of which the jaws may be operated, substantially as set forth.

3. In a bag-holder, the combination with a suitable supporting-frame comprising two sets of hinged legs, of a bag-mouth-holding frame pivoted to and connecting the upper ends of the legs, and spring-jaws pivoted to the bag-mouth-holding frame and adapted to engage the opposite sides thereof, substantially as set forth.

704,834. FIRE-ESCAPE. GEORGE W. JONES and JAMES C. JONES, Scotland, Ark. Filed Dec. 31, 1901. Serial No. 87,944. (No model.)



Claim.—1. A fire-escape comprising tripods adapted for attachment to the upper portion of a building above the windows having pulleys engaged therewith, additional pulleys adapted for attachment to the base of the building below the windows, a cable engaged with the first-named pulleys, baskets with which the ends of the said cable are engaged, and additional cables attached to the under sides of the baskets and passed around the second-named pulleys.

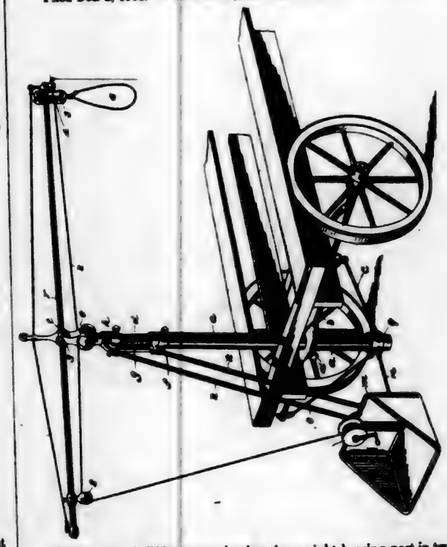
2. A fire-escape comprising a bail formed of an endless bar of metal including a bottom, sides and top, the sides being bent to form bearings, and the bottom and top being bent to form eyes, and a metal basket having trunnions at its upper edge pivotally engaged with the bearings, the upper and lower eyes being adapted for attachment of cables thereto.

704,835. IRONING-BOARD. GEORGE KABLER, Wymore, Nebr., assignor of one-half to Frank J. Uplinger, Wymore, Nebr. Filed Oct. 18, 1901. Serial No. 78,633. (No model.)

Claim.—1. The combination with a suitably-shaped board, a cleat thereon having a convex face, an abutment-bar bedded in the cleat, and a rest-block secured upon the board spaced from the cleat, of a spring-bar secured near one end on the cleat, and having contact with the abutment-bar, and a prop-leg hinged near one end thereof upon one springing end of the bar, said leg being held projected at a right angle from the board by the resilience of the spring-bar, and a lateral contact of one end upon a side edge of the rest-block.

2. The combination with a suitably-shaped board, a transversely-disposed cleat secured near one end thereon, a transverse rest-block secured on the board and spaced from the cleat, and a spring-bar secured near one of its ends upon the cleat so as to press toward the rest-block, of a prop-leg hinged near one of its ends upon an end of the spring-bar, and held at a right angle to the board in contact with the rest-block, by a keeper-block, said keeper-block comprising an oblong piece having two spaced angular slots in it, engaged by set-screws that may slide in longitudinal portions of the slots and interlock with lateral extensions thereof.

704,836. LIFTING-CRANE. THEODORE KAUFFMAN, Osborn, Ohio. Filed Dec. 2, 1901. Serial No. 84,428. (No model.)



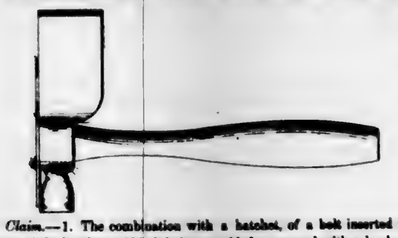
Claim.—1. A lifting-crane, having the upright bearing-post in two sections adjustable vertically, the counterbalance-platform, having bracing connections with said post, the winding-reel carried by said platform, the laterally-extending or horizontal crane-rod carried by said post, its pulleys, and the lifting-rope, substantially as specified.

2. In a lifting-crane, the combination with the upright post provided with wagon connections, and a laterally-extending rod or jib, of the counterbalance-platform adapted for the operator to stand therein, having a supporting-wheel resting upon the surface of the ground, and braced to said post, the winding-reel carried by said platform and the lifting-rope, substantially as specified.

3. The detachable crane comprising the crane-head, extension-rod, its movable pulleys, the bracket or frame, for connection to the bearing-post, the lifting-rope, the counterbalance-platform, the connections of the latter to said frame, the socket-foot, and the connection thereof to said platform, substantially as specified.

4. The combination with a wagon or rack, and its bearing-post and socket devices for holding said post, of the detachable crane-head, its extension-rod, and the pulleys thereon, the trip device, the bracket or frame secured to the crane-head, the counterbalance-platform connected to said frame, the reel, and lifting-rope, and the radial hook of the counterbalance-platform, substantially as specified.

704,837. SHINGLE-GAGE FOR HATCHETS. MILES M. KELLOGG, Boulder, Colo. Filed Mar. 27, 1902. Serial No. 100,270. (No model.)



Claim.—1. The combination with a hatchet, of a bolt inserted in the eye of the hatchet, said bolt being provided at one end with a hook to engage the wall of the eye and screw-threaded at its outer end, a longitudinally-slotted gage-plate arranged upon the outer edge of the hatchet, said bolt projecting through said slot, a nut for clamping said plate in position, said plate being provided with arms projecting laterally in opposite directions beyond the plane of the hatchet-blade, substantially as set forth.

2. A gage for hatchets comprising a longitudinally-slotted gage-plate having at one end laterally-projecting arms, and a bolt having a hook at one end and a nut at the other, substantially as set forth.

704,838. PLAYING-BALL. ELEAZER KEMPSHALL, Boston, Mass. Filed May 3, 1902. Serial No. 105,732. (No model.)

Claim.—1. A hollow playing-ball consisting entirely of two thin shells, whereof the inner shell is of hard, springy material, and the outer is thicker than the inner and consists of hard, plastic material; said inner shell having perforations through which the material of the outer shell protrudes.

2. A playing-ball consisting entirely of a thin, springy perforated metal shell, and a thicker shell thereon formed of hard springy plastic material.

3. A playing-ball consisting entirely of a thin, springy perforated metal shell, and a thicker shell thereon formed of hard springy plastic material, the material of said outer shell protruding into said perforations.

4. A hollow playing-ball consisting wholly of two thin shells, whereof the inner is thinner than the outer and consists of springy metal provided with perforations, said outer shell consisting of plastic material, portions whereof protrude into the perforations.

5. A playing-ball comprising a thin shell of springy metal, said shell being provided throughout with perforations, and a hard springy cover upon said shell.

6. A playing-ball comprising a thin shell of metal provided with perforations, and a shell of celluloid compacted upon said shell, portions of the celluloid protruding into said perforations.

7. A playing-ball comprising a complete shell having perforations and a shell thereon consisting of segments of plastic material welded together at their edges; portions of the plastic material entering said perforations and locking said shells together, and thereby preventing rupture of said plastic shell at the weld.

8. A playing-ball comprising a shell having barbs and a shell formed of joined segments of plastic material; said barbs being embedded in said plastic material and preventing separation of said segments.

9. A playing-ball comprising a thin metal shell having barbs and a shell formed of welded segments of plastic material; said barbs being embedded in said plastic material and preventing separation of said segments.

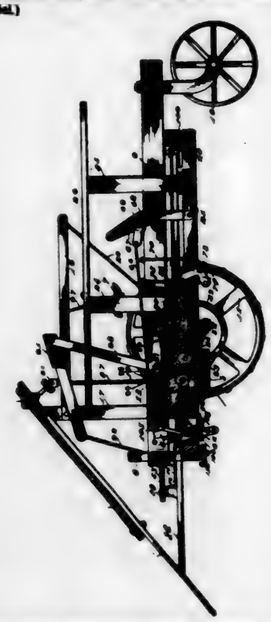
10. A playing-ball comprising a thin metal shell having barbs, and a shell formed of joined segments of celluloid; said barbs being embedded in said celluloid and preventing separation of said segments.

11. A playing-ball comprising a thin perforated metal shell having barbs and a shell formed of welded segments of plastic material; said barbs being embedded in said plastic material and preventing separation of said segments.

12. A playing-ball comprising a thin metal shell having struck-up barbs and a shell formed of joined welded segments of plastic material; said barbs penetrating and preventing separation of said segments.

13. A playing-ball comprising a shell having barbs and a shell formed of joined segments of plastic material; said barbs being embedded in said plastic material, the barbs in one hemisphere pointing toward those in the other hemisphere, thereby to clench said segments together.

704,839. CORN HARVESTER AND SHOCKER. GRANGER G. KIRKELL, Farmer, Ohio. Filed May 13, 1901. Serial No. 60,052. (No model.)



Claim.—1. In a corn harvester and shocker, the combination with a suitable frame and caster-wheel sills, the frame and sills having a hinged or pivotal connection with each other, of a tilting platform hinged to the frame, said platform carrying uprights which have sliding connection with the caster-wheel sills, whereby a lateral twisting of either is prevented and a central support secured on the upper ends of these uprights.

2. In a corn harvester and shocker, the combination with a suitable frame and caster-wheel sills, connected therewith, of a tilting platform hinged to the frame, said platform carrying uprights which have sliding connection with the caster-wheel sills, whereby a lateral twisting of either is prevented and a central support secured on the upper ends of these uprights.

3. In a corn harvester and shocker, the combination with a suitable frame and caster-wheel sills, connected therewith, of a tilting platform carrying uprights which have sliding connection with the caster-wheel sills, whereby a lateral twisting of either is prevented and a central support secured on the upper ends of these uprights.

4. The combination with a suitable frame and caster-wheel sills connected therewith, of a tilting platform and means for raising and lowering said platform, said means operating to automatically lock the platform when adjusted to its elevated position, and a spring suspensory device connected to the platform for assisting in raising it.

5. The combination with a suitable frame and a pair of caster-wheel sills suitably spaced apart and connected with the frame, of a tilting platform having uprights fitted and guided between the caster-wheel sills and adapted to be raised and lowered therebetween in the operations of moving the platform, whereby to prevent lateral motion of either of said parts with respect to the other, and a central support secured on the upper ends of said uprights.

6. The combination with a suitable frame and a pair of caster-wheel sills suitably spaced apart and connected with the frame, of a tilting platform having uprights fitted to and guided between the space intervening

between the caster-wheel sills and adapted to be raised and lowered therebetween in the operations of moving the platform, whereby to prevent lateral movement of either of said parts with respect to the other, a central support secured on the upper ends of said uprights, a bell-crank located on the sills, a curved link extending from one end of this bell-crank, between the sills, to the platform and means for rocking the bell-crank lever whereby to throw the bell-crank and link over the dead-center of the bell-crank and cause the platform to lock, and a spring suspensory device depending from the sills through the space between them, to the platform whereby to facilitate the raising of the latter.

7. The combination with a suitable frame and tilting platform hinged thereto, said platform having endless aprons arranged to traverse it, of sliding shoes adapted to hold the stalks that have accumulated when the platform is tilted downward and means connected with the platform and with the shoes for simultaneously reciprocating the latter with the movements of the platform.

8. The combination with a suitable frame, of a tilting platform having hinged connection therewith, endless aprons carried over said platform, a rock-shaft supported in boxes carried by the platform, said shaft having arms thereon one in the form of a bell-crank lever, a link connecting one end of this lever with a suitable stationary support, sliding shoes adapted to bridge the space between the frame and the adjacent ends of the platform and connecting-rods extending from the shoes to the arms on the rock-shaft.

9. The combination with a suitable frame, of a tilting platform having hinged connection therewith, endless aprons carried over said platform, a rock-shaft supported in boxes carried by the platform, said shaft having arms thereon, one in the form of a bell-crank lever, a link connecting one end of this lever with a suitable stationary support, sliding shoes adapted to bridge the space between the frame and the adjacent end of the platform, connecting-rods extending from the arms to the shoes and means for raising and lowering the platform with respect to the frame during the simultaneous sliding motions of the shoes.

10. The combination with a main frame, guide-frames and means for feeding cornstalks in standing position through the guide-frames and for cutting the stalks during their passage therethrough, of a tilting frame, endless aprons carried thereon, a central support connected with the platform, guide-bars, a cord extending from one guide-bar to the other, a packer for packing the stalks on either side of the central support against the cord and caster-wheel sills for guiding the tilting platform and preventing lateral movement thereof.

11. The combination with a suitable frame and tilting platform hinged thereto, said platform carrying endless aprons of a main shaft and a sprocket-wheel shaft carried by the main frame and intergeared with each other, a clutch for throwing these two shafts into or out of gear with each other and means driven by the main shaft for imparting a step-by-step movement to the sprocket-shaft.

12. The combination with a suitable frame and platform hinged thereto, said platform carrying endless aprons, of a drive-shaft, means for driving the latter, a gear-wheel loosely mounted on said shaft, a shipper for clutching it to the shaft, means for tilting the platform, said shipper in position to be operated by said means when the platform is thrown to one of its extreme positions, means for imparting a step-by-step motion to the endless-apron-driving shaft when the gear-wheel is released from the drive-shaft and means for adjusting the throw of said step-by-step driving mechanism.

13. The combination with a suitable frame, a tilting platform, said platform carrying an endless apron and means for raising and lowering and locking the platform, of a drive-shaft, an apron-driving shaft which receives motion from the main shaft when the tilting platform is in one of its positions and a step-by-step escapement mechanism for imparting intermittent motion to the apron when the platform is in its other extreme position.

14. The combination with a suitable frame, a tilting platform, said platform carrying an endless apron and means for raising and lowering and locking the platform, of a drive-shaft, an apron-driving shaft which receives motion from the main shaft when the tilting platform is in one of its positions, a step-by-step escapement mechanism for imparting intermittent motion to the apron when the platform is in its other extreme position, and means for adjusting the throw of the escapement mechanism.

15. The combination with a suitable frame and a platform having hinged connection therewith, of a main drive-shaft having a gear-wheel loosely mounted thereon, means for locking said gear-wheel to the shaft, means for tilting the platform and simultaneously causing the lock or release of the said gear-wheel, a shaft carrying sprocket-wheels and provided with a pinion adapted to be driven by the gear-wheel on the main shaft when said gear-wheel is locked to said main shaft, a ratchet-toothed wheel secured to the shaft which carries the sprocket-wheels, an eccentric carried by the main shaft, a rock-shaft having a bell-crank lever thereon, an eccentric-strap extending from the eccentric to a crank on the rock-shaft, a packer connected with the bell-crank lever and means for adjusting the throw of said packer.

16. The combination with a main frame, a main shaft revolubly supported therein, means for driving said shaft and a tilting platform having hinged connection with the main frame, said platform carrying endless aprons, of caster-wheel sills, a central support, uprights extending from the platform between the sills, to which the central support is secured, a shaft for driving the endless aprons, gearing for imparting a continuous motion to said apron-driving shaft when the tilting platform is in one of its positions, means for imparting a step-by-step motion to the endless aprons when the platform is in its other extreme position, a packer and guide-bars between which and the central support, the stalks are packed, a cord for receiving said stalks, guide-frames, cutters therein and feed mechanisms, substantially as described.

17. The combination with a frame, a platform, endless aprons, shaft for imparting motion to the latter, of a main drive-shaft having an eccentric thereon, a packer operated by the eccentric, and means extending from and supporting the packer for communicating motion to the apron-shaft.

18. The combination with a frame, a platform, endless aprons, shaft for imparting motion to the latter, of a main drive-shaft having an eccentric thereon, a packer operated by the eccentric, and means extending from and supporting the packer for communicating intermittent motion to the apron-shaft.

19. The combination with a frame, a platform connected therewith, endless aprons carried by the platform, a shaft for driving the aprons, said shaft having a ratchet-toothed wheel thereon, of a main drive-shaft, a packer driven thereby, a bell-crank lever supporting the packer, a lever having a pawl pivoted thereto adapted to engage the teeth of the ratchet-toothed wheel to impart intermittent impulses thereto, and a link connecting the two levers whereby motion is imparted form one lever to the other.

20. The combination with a frame, a platform connected therewith, endless aprons carried by the platform, a shaft for driving the aprons, said shaft having a ratchet-toothed wheel thereon, of a main drive-shaft, a packer driven thereby, a bell-crank lever supporting the packer, a lever having a pawl pivoted thereto adapted to engage the teeth of the ratchet-toothed wheel to impart intermittent impulses thereto, and a link connecting the two levers whereby motion is imparted from one lever to the other, and means for varying the adjustment of said link, whereby to increase or decrease the extent of vibratory movements of the lever which carries the pawl.

21. The combination with a frame, and a tilting platform, said platform carrying an endless apron, of a drive-shaft, an apron-driving shaft which receives motion from said shaft when the tilting platform is in one of its positions, and a step-by-step escapement mechanism for imparting intermittent motion to the apron when the platform is in its other extreme position.

704,840. EXERCISING-MACHINE. JOHN C. KORTH and AUGUST GARSEMBULLER, New York, N. Y. Filed Feb. 24, 1900. Serial No. 6,236. (No model.)

Claim.—1. In an exercising-machine, two elastic cords provided at one end with means for attachment to an elevated support, said cords extending normally downwardly from the support and parallel with each other, and each provided at its free end with a handle, and between its handle and point of support, with an eye adjustable thereon, and a link having a detachable engagement with the eyes of the cord, said eyes and link serving to tie the cords together at any desired point in their length, as and for the purpose set forth.

2. In an exercising-machine, two elastic cords provided at one end with means for attachment to a support, said cords normally extending downwardly from the support and parallel with each other, and each provided at its free end with a handle and intermediate of its ends with a ring secured thereto, and a split link engaging the rings of the said cords, substantially as described.

3. In an exercising-machine, two elastic cords provided at one end with means for attachment to an elevated support, said cords normally extending downwardly from the support parallel with each other, and each provided with a coupling at its lower end, eyes movable up and down on the cords between their point of support and their lower ends, means for connecting the eyes together to tie the cords together and hold them in close proximity to each other, and means for adjustably securing the said eyes on the cords whereby the cords can be tied together at any desired point in their length, substantially as described.

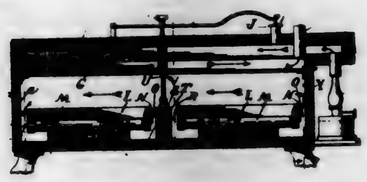
4. In an exercising-machine, two elastic cords each having one end fixedly secured to a device, by means of which the cords are connected with an elevated support, said cords normally extending downwardly parallel with each other and each provided with a coupling at its other end, and rings intermediate of the ends of the cords and adjustable up and down on said cords, as set forth.

5. In an exercising-machine, two elastic cords each having one end fixedly secured to a ring for engagement with an elevated support, said cords normally extending downwardly parallel with each other and each provided with a coupling at its other end, and intermediate of its ends with a ring adjustable thereon, as set forth.

6. In an exercising-machine, two elastic cords, each having one end fixedly secured to a support and provided at its other end with a coupling, said cords normally extending downwardly parallel with each other, rings movable up and down on the cords, and handles connected with said cords, substantially as herein shown and described.

7. In an exercising-machine, two elastic cords secured to a support so as to be independent of one another and extending downwardly parallel with each other, handles connected with the cords, and a connection between the cords intermediate of their ends, said connection being adjustable up and down on said cords, as set forth.

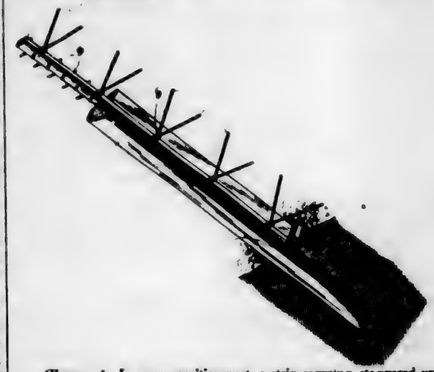
704,841. INCUBATOR. FRANK KRUPICKA, Milligan, Nebr. Filed Aug. 18, 1900. Serial No. 27,302. (No model.)



Claim.—1. An incubator comprising a casing, an egg-chamber in the lower part of the casing, said chamber having inlet and outlet openings in its opposite end walls, heating-chambers arranged in the upper part of the casing one above the other, and communicating with one another at one end, the upper chamber being provided at the end opposite that which communicates with the lower chamber with means for connection with a source of heat, a flue leading from the end of the lower chamber opposite that which communicates with the upper chamber, out through the upper chamber and the casing, a valved flue leading from the upper chamber out through the casing, and a thermostat arranged in the egg-chamber and operating the valve of said flue, as set forth.

2. An incubator comprising a casing having an extension at one end at the upper part thereof, an egg-chamber in the lower part of the casing and having inlet and outlet openings in its opposite end walls, heating-chambers arranged in the upper part of the casing one above the other, the upper chamber having one end extending into the extension of the casing and communicating with the lower chamber at its opposite end, a flue leading from the upper chamber out through the bottom of the extension and with which a source of heat is to be connected, a flue leading from the lower chamber at the end adjacent to the extension out through the upper chamber and the casing, a flue leading from the upper chamber out through the casing, a valve for controlling said flue, and a thermostat in the egg-chamber and controlling said valve, as set forth.

704,842. COMPOSITION FENCE-POST. DANIEL W. LARIMER and DAVID C. ELLIOTT, Goshen, Ind. Filed Jan. 23, 1902. Serial No. 91,627. (No model.)



Claim.—1. In a composition post, a strip carrying staggered projections embedded in the post and having one of its faces exposed with means carried by said exposed face for engagement with the wires of the fence, and a protecting-strip formed integral with the post and secured over the lower portion of the first-named strip, substantially as described.

2. In a composition post, a strip carrying a series of staggered projections embedded in the post and having one of its faces exposed with a series of staples carried by the exposed face of the strip for engagement with the wires of the fence, a protecting-strip carried by the post and covering the lower portion of the strip, and a cap carried by the upper end of the post and secured over the upper end of said strip, substantially as described.

704,843. PROCESS OF MAKING EXTRACT DYES. ROBERTO LEPETIT and EZZERO TAGLIANI, Buss, Italy. Filed July 18, 1896. Serial No. 599,718. (No specimens.)

Claim.—1. The process of obtaining an improved dye from the natural dyewood extract, which consists in treating the extract with a salt of sulfurous acid, under the influence of heat and pressure.

2. The process of obtaining an improved dye from a natural dyewood extract, which consists in treating the extract with a sulfurous-acid salt of an alkali metal, under the influence of heat and pressure.

3. The process of obtaining a new dye from natural-color extracts, which consists in treating the natural extract with sodium bisulfite at a temperature of from 110° to 150° centigrade under pressure.

704,844. MANIFOLDING MEMORANDUM BOOK OR PAD. EDWARD E. LEWIS, Franklin, Pa., assignor to the General Manifold Company, Franklin, Pa., a Corporation of Pennsylvania. Filed Sept. 4, 1901. Serial No. 74,398. (No model.)

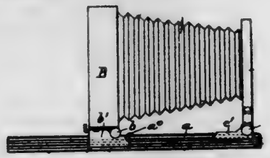
Claim.—1. A manifolding device consisting of a package provided with a series of separate stubs in combination with a series of writing and copying sheets, each sheet composed of two leaves, one leaf provided with a writing-surface on one side and a transfer-surface on its opposite side, and the other leaf provided with a transfer-receiving surface, said leaves separately and detachably secured at one end to the stubs along a weakened line and to each other at their opposite ends by a similar joint, substantially as described.

2. A manifolding device consisting of a package provided with separate stubs, in combination with an outside cover to which said stubs are connected and within which they are bound, each of said sheets composed of two leaves, each separately united at their upper ends to said stubs by covering-joints, and their lower ends united along a weakened line, one of said leaves provided with a writing-surface on one side and a transfer-surface on its opposite side, and the remaining leaf provided with a transfer-receiving surface, substantially as described.

704,845. CAMERA. HARVEY W. LOCKE, Rochester, N. Y., assignor to Century Camera Company, Rochester, N. Y., a Corporation of New York. Filed May 24, 1902. Serial No. 108,867. (No model.)

Claim.—1. In a camera, a bed having pairs of parallel slots on its side edges, two camera elements each movable on said bed and each hav-

ing a pair of plates adapted to slide in one pair of said slots, the side plates on said two elements being adapted to overlap when the two elements are brought close together.



2. In a camera, a bed having pairs of parallel slots on its side edges, the upper slot in each edge being in a rabbeted portion of said edge, two camera elements each movable on said bed, one having a pair of plates adapted to slide in the pair of upper slots and the other element having a pair of plates adapted to slide in the pair of lower slots, the side plates on said two elements being adapted to overlap when the two elements are brought close together.

3. In a folding camera, a sectional bed composed of parts hinged together and having pairs of parallel continuous slots on its side edges, two camera elements each movable on said bed and each having a pair of plates adapted to slide in one pair of said slots, the side plates on one of said two elements being adapted to overlap when the two elements are brought close together, one of the parts of the bed being of suitable length to bear the camera-box and lens-frame and another part of said bed being adapted to fold upward against an outer face of one of said elements when the same are brought close together.

4. In a folding camera, a sectional bed composed of parts hinged together and having parallel continuous slots on its side edges, the upper slot in each edge being in a rabbeted portion of said edge, two camera elements having a pair of plates adapted to slide in the pair of upper slots, and the other element having a pair of plates adapted to slide in the pair of lower slots, the side plates of one of said elements being adapted to overlap when the two elements are brought together, and one of the parts of the bed being of suitable length to bear the said two elements and another part of said bed being adapted to fold upward against an outer face of the said elements when the same are brought close together.

5. In a folding camera, a sectional bed composed of parts hinged together and having pairs of parallel continuous slots on its side edges, two camera elements each movable on said bed and each having a pair of plates adapted to slide in one pair of said slots, the side plates on one of said two elements being adapted to overlap when the two elements are brought close together, one of the parts of the bed being of suitable length to bear the camera-box and lens-frame, and another part of said bed being adapted to fold upward against an outer face of one of said elements when the same are brought close together, and an automatic catch on said bed for engaging one of said elements and holding it in the position for folding the bed against said outer face.

6. In a folding camera, a sectional bed composed of parts hinged together and having parallel continuous slots on its side edges, the upper slot in each edge being in a rabbeted portion of said edge, two camera elements each movable on said bed and one element having a pair of plates adapted to slide in the pair of upper slots, and the other element having a pair of plates adapted to slide in the pair of lower slots, the side plates of one of said elements being adapted to overlap when the two elements are brought together and one of the parts of the bed being of suitable length to bear the said two elements and another part of said bed being adapted to fold upward against an outer face of the said elements when the same are brought close together, and an automatic catch on said bed for engaging one of said elements and holding it in the position for folding the bed against said outer face.

7. In a camera, a bed having pairs of parallel slots on its side edges, a camera-box having a plate on each side adapted to slide in one of said slots, a lens-frame having a plate on each side adapted to slide in the other of said slots, the side plates of the camera-box and of the lens-frame being adapted to overlap one over the other when the camera-box and lens-frame are brought close together.

8. In a camera, a bed having pairs of parallel slots on its side edges, the upper slot of each pair being in a rabbeted portion of the edge of the bed, a camera-box having a plate on each side adapted to slide in one of said slots, a lens-frame having a plate on each side adapted to slide in the other of said slots, the side plates of the camera-box and of the lens-frame being adapted to overlap one over the other when the camera-box and lens-frame are brought close together.

9. In a camera, a sectional bed composed of parts attached together and having pairs of parallel continuous slots on its side edges, a camera-box having a plate on each side adapted to slide in one of said slots, a lens-frame having a plate on each side adapted to slide in the other of said slots, the side plates of the camera-box and of the lens-frame being adapted to overlap one over the other when the camera-box and lens-frame are brought close together.

10. In a camera, a sectional bed composed of parts attached together and having pairs of parallel continuous slots on its side edges, the upper slot of each pair being in a rabbeted portion of the edge of the bed, a camera-box having a plate on each side adapted to slide in one of said slots, a lens-frame having a plate on each side adapted to slide in the other of said slots, the side plates of the camera-box and of the lens-frame being adapted to overlap one over the other when the camera-box and lens-frame are brought close together, one of the parts of the bed being of suitable length to bear the camera-box and lens-frame and another part of said bed being adapted to fold upward against an outer face of the said parts when the same are brought close together.

11. In a folding camera, a sectional folding bed composed of parts hinged together and having pairs of parallel continuous slots on its side edges, a camera-box having a plate on each side adapted to slide in one of said slots, a lens-frame having a plate on each side adapted to slide in the other of said slots, the side plates of the camera-box and of the lens-frame being adapted to overlap one over the other when the camera-box and lens-frame are brought close together, one of the parts of the bed being of suitable length to bear the camera-box and lens-frame and another part of said bed being adapted to fold upward against an outer face of the said parts when the same are brought close together.

12. In a folding camera, a sectional folding bed composed of parts hinged together and having pairs of continuous parallel slots on its side edges, the upper slot of each pair being in a rabbeted portion of the edge of the bed, a camera-box having a plate on each side adapted to slide in one of said slots, a lens-frame having a plate on each side adapted to slide in the other of said slots, the side plates of the camera-box and of the lens-frame being adapted to overlap one over the other when the camera-box and lens-frame are brought close together, one of the parts of the bed being of suitable length to bear the camera-box and lens-frame, and another part of said bed being adapted to fold upward against an outer face of the said parts when the same are brought close together.

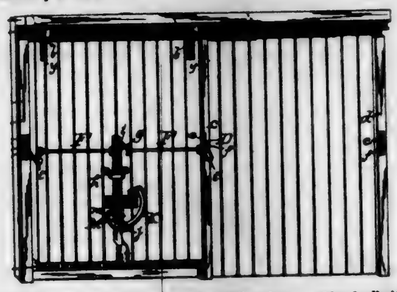
13. In a camera, a sectional bed composed of parts attached together and having pairs of parallel continuous slots on its side edges, the upper slot of each pair being in a rabbeted portion of the edge of the bed, a camera-box having a plate on each side adapted to slide in one of said slots, a lens-frame having a plate on each side adapted to slide in the other of said slots, the side plates of the camera-box and of the lens-frame being adapted to overlap one over the other when the camera-box and lens-frame are brought close together, and a catch on said bed for engaging the camera-box and holding it in the proper position for folding the camera.

14. In a folding camera, a sectional folding bed composed of parts hinged together and having pairs of parallel continuous slots on its side edges, a camera-box having a plate on each side adapted to slide in one of said slots, a lens-frame having a plate on each side adapted to slide in the other of said slots, the side plates of the camera-box and of the lens-frame being adapted to overlap one over the other when the camera-box and lens-frame are brought close together, one of the parts of the bed being of suitable length to bear the camera-box and lens-frame and another part of said bed being adapted to fold upward against an outer face of the said parts when the same are brought close together, and a catch on said bed for engaging the camera-box and holding it in the proper position for folding the camera.

15. In a folding camera, a sectional folding bed composed of parts hinged together and having pairs of continuous parallel slots on its side edges, the upper slot of each pair being in a rabbeted portion of the edge of the bed, a camera-box having a plate on each side adapted to slide in one of said slots, a lens-frame having a plate on each side adapted to slide in the other of said slots, the side plates of the camera-box and of the lens-frame being adapted to overlap one over the other when the camera-box and lens-frame are brought close together, one of the parts of the bed being of suitable length to bear the camera-box and lens-frame and another part of said bed being adapted to fold upward against an outer face of the said parts when the same are brought close together, and a catch on said bed for engaging the camera-box and holding it in the proper position for folding the camera.

704,848. SLIDING DOOR. JOHN F. LYDON, Davenport, Iowa, assignor to the International Manufacturing Company, Davenport, Iowa, a Corporation of Iowa. Filed Oct. 19, 1900. Serial No. 33,541. (No model.)

Claim.—1. The combination of a wall having a doorway therein, the three vertically-disposed stripe c secured to the wall and extending outward therefrom, the strips being at uniform distances apart, and two of the strips being arranged adjacent to the opposite edges of the doorway in the wall, a track arranged above the doorway, a sliding door mounted upon the said track and arranged to travel in front of the intermediate strip, the said door being capable of a limited lateral movement while retaining its vertical position, and means for moving the door laterally inward toward the face of the wall between either pair of the said strips, substantially as set forth.



2. The combination of a suspended sliding door capable of a limited lateral movement, a track upon which the door is supported, a horizontally-disposed crank-shaft for locking the door, a lever mounted upon the door, and a connecting-link between the lever and the crank-shaft, these parts being disposed to have the arm of the lever to which the link is connected and the link in alinement when the rock-shaft is turned to locking position, substantially as set forth.

3. The combination with a wall having a doorway therein and lock counterparts on either side of the doorway, of a sliding door capable of a limited lateral movement, a crank-shaft having its ends formed to engage with the said lock counterparts, a lever supported by the door and arranged to move in a plane parallel with the face thereof, and a connecting-link between the lever and the crank-shaft, said link and the arm of the lever to which it is connected being arranged to be in alinement when the crank-shaft is turned into position to cause the locking of the door, substantially as set forth.

4. The combination with a wall having a doorway therein, a suspended sliding door capable of a limited lateral movement a rock-shaft carried by the door and having at its opposite ends hooks, and catches with which the said hooks are adapted to engage supported by the said wall, the said catches being set out from the face of the wall, whereby when the rock-shaft is moved to cause the engagement of its hooks with the said catches, the door is forced inward toward the face of the wall, substantially as set forth.

5. The combination with a wall having a suitable doorway therein and having lock counterparts on each side of said doorway, and a suspended sliding door capable of a limited lateral movement while retaining its vertical position, of a horizontal rock-shaft suitably journaled to said door which is provided with a crank mediate its length, hooks on the ends thereof adapted to engage said counterparts, a vertically-movable link engaging said crank, and lever connected to and actuating said link and means for locking said lever when it alines with said link.

6. The combination with a wall having a suitable doorway therein and having lock counterparts on each side of said doorway, and a suspended sliding door capable of a limited lateral movement while retaining its vertical position, of a horizontal rock-shaft suitably journaled to said door which is provided with a crank mediate its length, hooks on the ends thereof adapted to engage said counterparts, a vertically-movable link engaging said crank, and lever connected to and actuating said link and automatic means for locking said lever when it alines with said link.

7. A device for locking a sliding door, comprising a horizontal rock-shaft suitably journaled to said door and provided with a crank mediate its length, hooks on the ends thereof, a link engaging said crank, a lever connected to and actuating said link a segmental frame extending transversely through a guide-opening in said lever, and a longitudinally-reciprocal bolt adapted to shoot through said segmental frame when said lever alines with said link.

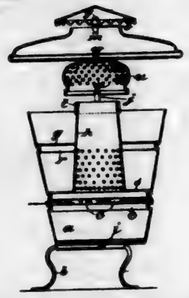
8. A device for locking a sliding door, comprising a horizontal rock-shaft suitably journaled to said door and provided with a crank mediate its length, hooks on the ends thereof, a link engaging said crank, a lever connected to and actuating said link, a segmental frame extending transversely through a guide-opening in said lever, and a longitudinally reciprocal bolt having a transverse opening therethrough adapted to shoot through said segmental frame when said lever alines with said link.

9. A locking device for a sliding door comprising a horizontally-disposed rock-shaft suitably journaled to said door which is provided with a crank mediate its length, and with hooks on the ends thereof, a vertically-movable link engaging said crank, a lever connected to and actuating said link, the arm of the lever to which the link is connected being arranged to be in alinement therewith when the parts are turned into locking position and a bolt for locking said lever when it alines with said link.

10. The combination with a suspended sliding door capable of a limited lateral movement, of a horizontal rock-shaft consisting of a continuous stretch of metal bar or rod, the ends of which extend beyond the sides of said door, and are bent so as to make an outward detour to form arms, and then bent back to form hooks on the side of the rock-shaft opposite the arms, and devices for operating said rock-shaft.

11. The combination with a suspended sliding door capable of a limited lateral movement, of a horizontal rock-shaft consisting of a continuous stretch of metal bar or rod, which is bent mediate its ends to form a crank and the ends of which extend beyond the sides of said door and are bent to make an outward detour to form arms, and are then bent back to form hooks on the side of the rock-shaft opposite from the arms, and devices for operating said rock-shaft.

704,847. APPARATUS FOR DESTROYING BUGS OR OTHER INSECTS INFESTING DWELLINGS OR LIKE PLACES. CONRADT MATTHEY-MEIER, Basle, Switzerland. Filed Mar. 1, 1902. Serial No. 96,219. (No model.)



Claim.—1. An apparatus for destroying bugs and other insects infesting dwellings and the like by the combustion of sulfur or a mixture of sulfur and carbon or other combustible material capable of producing on combustion poisonous gases, consisting of an inferior pan, a truncated conical envelop of sheet metal put on the upper end of said pan, carrying an internal annular grate adapted to receive the combustible material to be burned and being provided on its lower part below the grate with downward-directed air-inlet channels, and an upright chimney connected to the grate and arranged within the said truncated conical envelop so as to extend upward above the said grate.

2. An apparatus for destroying bugs and other insects infesting dwellings and the like by the combustion of a combustible material capable of producing on combustion poisonous gases, consisting of an inferior pan, a truncated conical envelop of sheet metal put on the upper end of the pan, carrying two superposed internal annular grates the upper of which is designed to receive the combustible material to be burned, and being provided on its lower part with downward-directed air-inlet channels, and an upright chimney within the said envelop, connecting the two grates and arranged so as to extend upward above the upper grate, substantially as described.

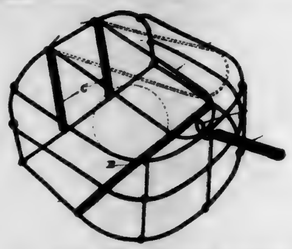
3. An apparatus for destroying bugs and other insects infesting dwellings and the like by the combustion of a combustible material capable of producing on combustion poisonous gases, consisting of an inferior pan, a truncated conical envelop of sheet metal put on the upper end of the pan, carrying an internal annular grate to receive the combustible material and being provided on its lower part below the grate with downward-directed air-inlet channels, an upright chimney connected to the grate and arranged within the said truncated conical envelop so as to extend upward above the grate, a perforated cap on the chimney and an annular hood carried and held by the said envelop at a certain distance above this latter and surmounted by a cap so as to prevent the combustion-flame from attaining a dangerous height above the apparatus, substantially as described.

4. An apparatus for destroying bugs and other insects infesting dwellings and the like by the combustion of a combustible material capable of producing on combustion poisonous gases, consisting of an inferior pan, a truncated conical envelop of sheet metal put on the upper end of the pan, carrying two superposed internal annular grates the upper of which is designed to receive the combustible material to be burned and being provided on its lower part with downward-directed air-inlet channels, an upright chimney within the said envelop, connecting the two grates and arranged so as to extend upward above the upper grate, this chimney being perforated with holes around its circumference at that part situated between the said two grates, a perforated cap on the chimney and an an

nular hood carried and held by the said envelop at a certain distance above this latter and surmounted by a cap so as to prevent the combustion-flame from attaining a dangerous height above the apparatus, substantially as described.

5. An apparatus for destroying bugs and other insects infesting dwellings and the like by the combustion of a combustible material capable of producing on combustion poisonous gases, consisting of an inferior pan, a truncated conical envelop of sheet metal put on the upper end of the pan, carrying two superposed internal annular grates the upper of which is designed to receive the combustible material to be burned, an upright chimney within the said envelop, connecting the two grates and arranged so as to extend upward above the upper grate, this chimney being perforated with holes around its circumference at that part situated between the said two grates, and air-inlet apertures, below the lower grate, near the lower part of the said envelop.

704,848. **DEVICE FOR GATHERING BALLS.** FRANCIS MINTON, London, England, assignor to Charles Minton, London, England. Filed Mar. 14, 1902. Serial No. 98,255. (No model.)



Claim.—1. A device for picking up balls, comprising a receptacle having one or more admission-openings and flexible retaining-strips across said openings, substantially as described.

2. A device for picking up balls comprising a receptacle having an admission-opening inclined so as to make an acute angle with one of the faces of said receptacle, and flexible strips across said opening.

3. A device for picking up balls comprising a receptacle having one or more admission-openings, a movable door for facilitating withdrawal of the balls and flexible strips across the admission-openings, substantially as described.

4. A device for picking up balls comprising a receptacle having one or more admission-openings and one or more elastic retaining-strips across each opening substantially as described.

5. A device for picking up balls comprising a wire framework open on one side at least and one or more spiral springs stretched across the opening to form a retaining-strip substantially as described.

6. A device for picking up balls comprising a wire framework open on two contiguous faces making other than a right angle with each other and spiral springs stretched across said openings, substantially as described.

7. A device for picking up balls comprising a wire framework open on one side at least for admission of a ball and having an opening for withdrawing the balls, one or more elastic retaining-strips across the admission-opening a door in said withdrawal-opening and means for fastening said door.

704,849. **CEMENT.** JAMES T. MCKIM, Thorntown, Ind., assignor of one-half to Lewis Miller, Thorntown, Ind. Filed Jan. 22, 1902. Serial No. 90,058. (No specimens.)

Claim.—1. A cement composed of Portland cement, sand, calcareous ocher, iron-ore paint and litharge.

2. A compound to be added to Portland or similar cement, consisting of calcareous ocher, iron-ore paint and litharge.

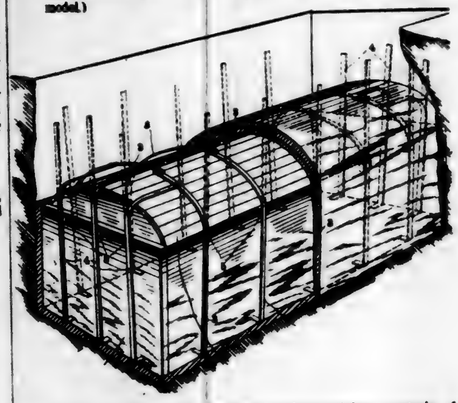
3. A compound to be added to Portland or similar cement, consisting of calcareous ocher, iron-ore paint and litharge in the proportions specified.

4. A compound to be added to Portland or similar cement, consisting of calcareous ocher, iron-ore paint and litharge thoroughly ground, subjected to a temperature of 160° Fahrenheit and then cooled.

5. A cement composed of approximately ten parts of a calcareous compound consisting of approximately forty-nine parts calcareous ocher, forty-nine parts iron-ore paint, and two parts litharge; approximately seventy parts of Portland or similar cement; and approximately seventy parts of clean sharp sand.

6. A cement composed of approximately ten parts of a calcareous compound consisting of approximately forty-nine parts calcareous ocher, forty-nine parts iron-ore paint, and two parts litharge, ground, subjected to 160° Fahrenheit and cooled; approximately seventy parts of Portland or similar cement; and approximately seventy parts of clean sharp sand.

704,850. **BURIAL-VAULT.** JAMES T. MCKIM and LEWIS MILLER, Thorntown, Ind. Filed Feb. 1, 1902. Serial No. 92,132. (No model.)



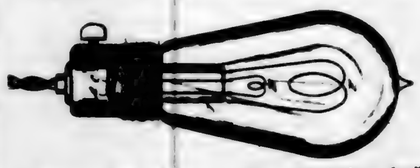
Claim.—1. The combination with a casket-receiving receptacle, of a plurality of strengthening-strips secured to said receptacle and having portions lying clear thereof, and a cement covering incasing the receptacle and embedding portions of said strips.

2. The combination with a casket-receiving box, of a plurality of strengthening-strips each secured at one of its ends to said box, said strips being adapted to be brought together in an arch over and free from the box-cover, the box-cover, and a cement covering incasing the box and embedding said strips.

3. The combination with a casket-receiving box, of a plurality of strengthening-strips each secured to the bottom of the box and extended up alongside the box free from the sides thereof and adapted to be arched thereover, a cover for the box, and a cement covering incasing the box and embedding the strips.

4. The combination with a casket-receiving box, of a plurality of strengthening-strips each secured to the bottom of the box, extended up alongside the box and adapted to be joined in pairs to form a series of arches over the cover of the box, the said cover, other strengthening-strips each secured at one end to the bottom of the box and at their free ends adapted to be secured to the adjacent strengthening-arch, and a cement covering incasing the box and embedding the strips.

704,851. **ELECTRIC LAMP.** HENRY W. HENNEL, Jr., Port Townsend, Wash. Filed Feb. 6, 1902. Serial No. 92,773. (No model.)



Claim.—1. An electric lamp comprising a globe having a plurality of filaments and a conducting screw-collar for the lamp-socket with one end of each filament connected to said screw-collar and separate insulated contacts arranged on the upper face of the neck of the globe and connected to the other ends of the filaments, said insulated contacts being made as cams having their upper faces inclined to correspond to the pitch of the screw-collar substantially as and for the purpose described.

2. An electric lamp comprising a globe having a plurality of filaments, and a conducting screw-collar for the lamp-socket with one end of each filament connected to said screw-collar, and separate insulated contacts arranged on the upper face of the neck of the globe, and connected to the other ends of the filaments, said contacts being made of different heights to cooperate separately or collectively with a yielding electrode in the lamp-socket substantially as and for the purpose described.

3. An electric lamp comprising a globe having a plurality of filaments and a conducting screw-collar for the lamp-socket with one end of each filament connected to said screw-collar, separate insulated contacts arranged on the upper face of the neck of the globe and connected to the other ends of the filaments and made of different height as described, and a lamp-socket screw-threaded to mesh with the collar of the globe and having a yielding electrode arranged to bear separately or collectively upon the globe-contacts substantially as described.

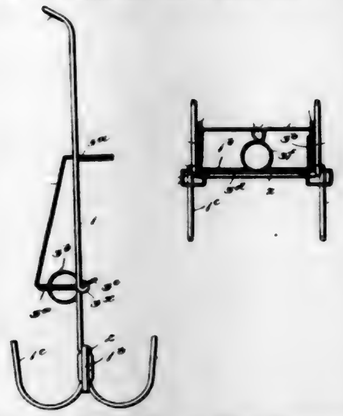
4. An electric lamp comprising a globe having a plurality of filaments, and a conducting screw-collar for the lamp-socket with one end of each filament connected to said screw-collar, separate insulated contacts arranged in the upper face of the neck of the globe and connected to the other ends of the filaments and made of different heights as described and a lamp-socket screw-threaded to mesh with the collar of the globe, and having a yielding electrode arranged to bear separately or collectively upon the globe-contacts, the said yielding electrode and globe-contacts being adapted as described to be brought into separate or collective contact by a rotation of the globe in its socket as described.

5. In an electric lamp of the kind described, a globe having a plurality of filaments with terminal insulated contacts made of different heights as described whereby the higher of said contacts is made to hold a yielding electrode away from and out of contact with the next adjacent and lower contact as described.

6. In an electric lamp of the kind described, a globe having a plurality of filaments with two terminal insulated contacts, one of said contacts being made relatively broad and low and the other one narrow and high in relation to each other substantially as described.

7. In an electric lamp of the kind described, a globe having a plurality of filaments with terminal insulated contacts having contacting faces inclined to form cams substantially as described.

704,852. **GRAPPLING DEVICE.** GEORGE F. BOLTZ, Fort Madison, Iowa. Filed Sept. 20, 1901. Serial No. 75,879. (No model.)



Claim.—1. The grapple having a loop member having hook terminals and a second member also having hook terminals fixed together, and means for lowering and raising the said grapple, substantially as set forth.

2. The grapple comprising a loop member having hook terminals and a second member having also hook terminals fixed together, a frame or third member pivoted to the first member, and means for the lowering and raising of the grapple, substantially as set forth.

3. The grapple comprising a loop member having hook terminals and a second member also having hook terminals fixed together, a member or frame having coincident springs, and means for lowering and raising the grapple, substantially as set forth.

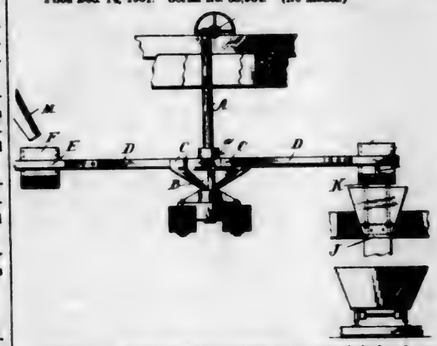
4. The grapple comprising a loop member having hook terminals and a second member also having hook terminals fixed together, a pivoted right-angled member or frame having bent projections adapted to engage the first member, and coincident coiled springs with their forming-wires adapted to form stops, and means for lowering and raising said grapple, substantially as set forth.

5. The grapple comprising a loop member having hook terminals and a pivoted member having at its lower end, at the corners, loops adapted to serve as stops to hold off the hooks from the pump-stock and to retain the first-referred-to member in proper position in the movement upon the wire or cable applied to the pump-stock, substantially as set forth.

6. The grapple comprising a loop member having hook terminals and a pivoted member having at its lower end, at the corners, loops or stops, and a spring connected with, and possessing said stops with spring action, substantially as set forth.

7. The grapple comprising a loop member having hook terminals, and a pivoted member having lateral wires or portions bowed or extended beyond their connecting-wires toward the pump-stock, substantially as set forth.

704,853. **ORE-SAMPLER.** SIDNEY R. BRETHERTON, Denver, Colo. Filed Dec. 14, 1901. Serial No. 85,984. (No model.)

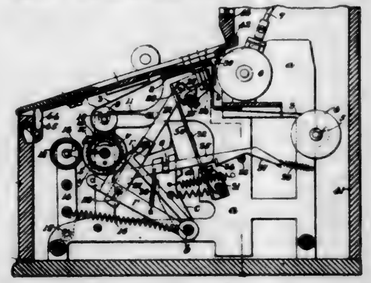


Claim.—1. An ore-sampler consisting of a vertical shaft and means for rotating it, a spider adjustable on the supporting-shaft and having radiating arms detachable therewith as specified, the said arms carrying at their free ends balanced buckets having projections for engaging a fixed tripper device dumping the buckets, and the buckets having a stop device permitting it to swing in one direction only beyond its balanced position as set forth.

2. In an ore-sampler employing a vertical shaft and horizontally-disposed arms fixedly secured to and radiating from said shaft, the combination therewith of buckets pivoted to the said arms and carried thereby, and means in the path traveled by the buckets adapted to tilt and dump them on their pivots, substantially as described.

3. In an ore-sampler, the combination with a supporting-shaft and detachable arms radiating from and horizontally supported on said shaft, pivots on the arms in alinement therewith, balanced buckets supported on the said pivots and a fixed tripper device in the path traveled by the buckets adapted to tilt and dump them, substantially as described.

704,854. **TIME-RECORDER FOR WORKMEN OR SERVANTS OR LIKE APPARATUS.** FRANK BROOK, Lindley, Huddersfield, England, assignor to Peter MacMaster, Hampstead, county of Middlesex, England. Filed Feb. 27, 1902. Serial No. 95,990. (No model.)



Claim.—1. The combination, in a time-recorder, of a frame, an actuating-shaft, a feed-roller pivotally mounted in said frame, a ratchet-wheel on said feed-roller, a feed-pawl engaging said ratchet-wheel, an oscillating pawl-carrier bearing said pawl, a wheel connected by a pin and slot to said pawl-carrier, and gearing connecting said wheel to the actuating-shaft of the apparatus, substantially as, and for the purpose, hereinbefore described.

2. The combination, in a time-recorder, of a frame, an actuating-shaft, a magazine-roller, a feed-roller pivotally mounted in said frame, a spring-pressed friction-roller bearing against said feed-roller, a ratchet-

wheel on said feed-roller, a feed-pawl engaging with said ratchet-wheel, an oscillating pawl-carrier bearing said pawl, a wheel connected by a pin and slot to said pawl-carrier, gearing connecting said wheel to the actuating-shaft of the mechanism, and a receiving-roller, substantially as, and for the purposes, hereinbefore described.

3. The combination, in a time-recorder, of a magazine-roller, time-printing wheels, inking mechanism, a printing-hammer, an actuating-shaft, gearing connecting said hammer and said actuating-shaft, a stationary writing-table arranged above said hammer, a feed-roller, gearing having lost motion connecting said feed-roller and said actuating-shaft, a friction-roller coacting with said feed-roller, and a receiving-roller coacting with said feed-roller, substantially as, and for the purposes, hereinbefore described.

4. The combination, in a time-recorder, of a writing-table, a cover having an aperture arranged above the said writing-table, guides on said writing-table, a shutter movable in said guides, forks on said shutter, pivotally-mounted cranks engaging said forks, an actuating-shaft, and gearing having lost motion connecting said cranks and said actuating-shaft, substantially as, and for the purposes, hereinbefore described.

5. The combination in a time-recorder, of a frame, an actuating-shaft, a feed-roller, rings having roughened peripheral surfaces and fitting on the said feed-roller, means for securing said rings on said feed-roller, a ratchet-wheel on said feed-roller, a feed-pawl engaging said ratchet-wheel, an oscillating pawl-carrier bearing said pawl, a wheel connected by a pin and slot to said pawl-carrier, and gearing connecting said wheel to the actuating-shaft, substantially as described.

6. The combination, in a time-recorder, of a frame, an actuating-shaft, a magazine-roller pivotally mounted in said frame, time-printing mechanism, inking mechanism, a stationary writing-table, a feed-roller, a spring-pressed friction-roller engaging with said feed-roller, a receiving-roller, a detachable cover, an aperture formed in said cover and registering with said writing-table, a rock-shaft pivotally mounted on said cover, an external handle on said rock-shaft, a crank-arm on said rock-shaft, and a forked lever mounted on said actuating-shaft and engaging said crank-arm, substantially as described.

7. The combination, in a time-recorder, of a frame, an actuating-shaft, a magazine-roller pivotally mounted in said frame, time-printing mechanism, inking mechanism, a stationary writing-table, a feed-roller, a spring-pressed friction-roller engaging said feed-roller, a receiving-roller, a detachable cover, an aperture formed in said cover and registering with said writing-table, a rock-shaft pivotally mounted on said cover, an external handle on said rock-shaft, a crank-arm on said rock-shaft, a forked lever mounted on said actuating-shaft and engaging said crank-arm, an arc-shaped rack on said rock-shaft, and a pivoted spring-controlled pawl coacting with said rack, substantially as described.

8. The combination, in a time-recorder, of a casing, an actuating-shaft, a detachable cover to said casing, a rock-shaft pivotally mounted on said cover, an external handle on said rock-shaft, an arc-shaped rack on said rock-shaft, a pivoted spring-controlled pawl coacting with said rack, an internal lever-arm on said rock-shaft, a lever-arm on said actuating-shaft, and a pin and interengaging fork on said lever-arms, substantially as, and for the purposes, hereinbefore described.

9. In a time-recorder, the combination of a frame, an actuating-shaft, a spring controlling said actuating-shaft, means for oscillating said actuating-shaft, a magazine-roller, time-printing wheels, inking mechanism, a pivoted spring-pressed printing-hammer, a spring-controlled bar, linkwork connecting said bar to said actuating-shaft, interengaging projections on said hammer and said bar, a cam on said bar for tripping said projections, a stationary writing-table, a feed-roller, gearing having lost motion connecting said feed-roller and said actuating-shaft, a spring-pressed friction-roller bearing against said feed-roller, a receiving-roller, a casing having an aperture arranged above said writing-table, a sliding shutter arranged beneath said aperture, guides for said shutter, and gearing having lost motion connecting said shutter and said actuating-shaft, substantially as described.

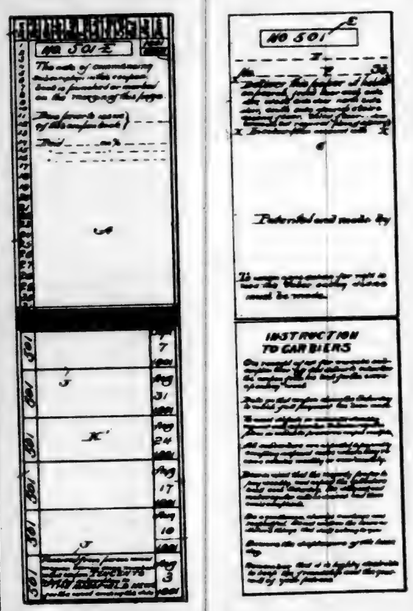
10. The combination, in a time-recorder, of a frame, a magazine-roller, time-printing wheels, a printing-hammer, inking mechanism, a writing-table rigidly fixed on said frame above said printing-hammer, a shutter mounted in guides over said table, a feed-roller, and friction and receiving rollers coacting with said feed-roller, the same being adapted to feed and print a recording-strip extending from said magazine-roller, between said time-printing wheels and said hammer, between said table and said shutter, over said friction-roller, between said friction-roller and said feed-roller, around said feed-roller and between said feed-roller and said receiving-roller, and onto said receiving-roller, substantially as described.

11. The combination, in a time-recorder, of a frame, an actuating-shaft, a feed-roller, rings having roughened peripheral surfaces and fitting onto said feed-roller, means for removably securing said rings on said feed-roller, and gearing connecting said actuating-shaft and said feed-roller, substantially as described.

704,855. DOOR-STOP. CHESTER C. BENNETT, Bayonne, N. J. Filed Nov. 26, 1901. Serial No. 83,868. (No model.)

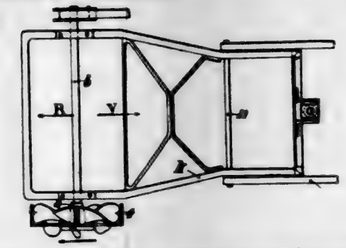
Claim.—A door and a bar hinged at one end directly to the door and free at the other, with a guide-loop and a stop against which the bar strikes so as to rest thereon freely or without becoming attached so that the door can be closed without the bar having to be first disengaged from any holding device.

704,856. COUPON COLLECTION AND RECEIPT BOOK. WILLIAM S. CAPPELLER, Mansfield, Ohio, and CHARLES S. PATTERSON, New York, N. Y. Filed July 30, 1901. Serial No. 70,171. (No model.)



Claim.—A coupon collection and receipt book comprising covers, the outside face of the front cover provided with a designating-numeral, spaces for the reception of a name and place of residence, instructions as to the place of delivery of an article, and the name and address of the party with whom the account is opened, the inside face of the front cover provided with dats indicating the date on which the account was opened, a designating-numeral corresponding with the one on the outside face of the front cover, and appropriately-designated spaces for the entry of any amounts due prior to the issue of the book and for the entry of amounts paid on account of prior amounts due, the inside face of the back cover containing instructions to carriers, and a plurality of leaves bound with the covers, the leaves wholly consisting of a series of detachable coupons, each coupon bearing a date, a designating-numeral corresponding to the other designating-numerals heretofore mentioned, and a receipt signifying the amount paid, the article for which it was paid and the length of time during which the article paid for will be delivered, the date on the coupon corresponding with the date on which the subscription for the article ends, the coupons arranged in consecutive order from the bottom to the top of the leaf, each coupon being detachably secured to the one adjacent thereto and above it.

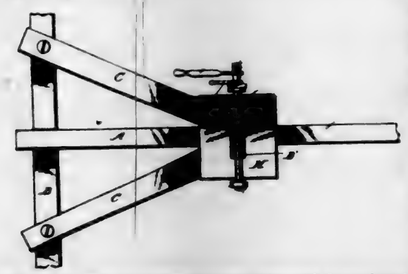
704,857. ROTARY APPARATUS OR PLOW FOR TREATMENT OF GROUND. ANDRÉ CASTELLIN, Paris, France, assignor to the Société Anonyme d'Études et d'Exploitation des Brevets A. Castelin pour Machines Agricoles Automobiles, Paris, France. Filed Jan. 9, 1902. Serial No. 89,086. (No model.)



Claim.—1. A rotary plow comprising a hub, radial arms extending therefrom and bent at right angles near their ends, and approximately S-shaped hoes supported by said radial arms.

2. A rotary plow comprising an axis, a hub mounted thereon, radial arms extending from said hub, and bent at a right angle near their ends, and hoes attached to said radial arms and supported intermediate the points by such right-angular bends.

704,858. COUPLING FOR WAGONS. WILLIAM S. CHAPMAN, Kippen, Idaho, assignor of one-half to Andrew J. Erickson and Albert H. Peterson, Kippen, Idaho. Filed Apr. 19, 1902. Serial No. 103,692. (No model.)



Claim.—In a wagon-coupling, the combination, with the rear bounds and the reach, of independently-movable gripping-jaws arranged on opposite sides of the reach and provided with extended lugs or heads at the opposite ends, a rigid metal casing applied to the ends of the bounds and extending over the reach and provided on the upper and under sides with guideways for reception of the said heads of the jaws, whereby the latter are adapted to slide laterally in the casing, a frame which surrounds the casing transversely, and the screw-clamp connected with the jaws and frame and adapted for adjusting the jaws relative to the reach, as shown and described.

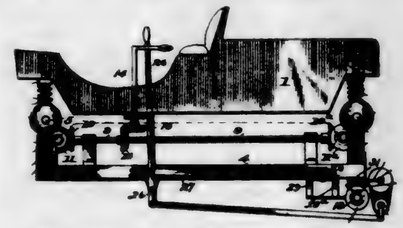
704,859. ELECTRIC ACCUMULATOR-ELECTRODE. VICTOR CERVAL and JOSEPH LUDEMAN, Brussels, Belgium. Filed Nov. 21, 1901. Serial No. 83,103. (No model.)

Claim.—1. An improved electrode for accumulator-batteries comprising a mass of active material, a perforated envelop, inclosing the mass, and radial insulating-arms projecting from the envelop, substantially as described.

2. An improved electrode for accumulator-batteries, comprising a central conducting-rod, a mass of active material packed around it and a perforated envelop around the mass with radial insulating-arms secured to the envelop, said envelop being open at the top and bottom, substantially as described.

704,860. AUTOMOBILE. SAMUEL S. CONANT, Edgerton, Ohio. Filed Apr. 26, 1902. Serial No. 104,739. (No model.)

Claim.—1. The combination, with a vehicle-body and base-frame, of vertical guide-shafts, axle-hubs having gears connected therewith and both adapted to slide and rotate on said guides, spiral springs interposed between the hubs and the body of the vehicle and encircling the aforesaid guides, transverse shafts carrying worms that engage the said gears, a third shaft suitably geared with the said transverse shafts, and a hand-shaft geared with such third shaft and adapted to be operated from the seat of the vehicle for swinging the hubs and axles horizontally and thus guiding the vehicle, substantially as shown and described.



2. The combination, with a rigid frame and vertical guides arranged therein, of stub-axles having hubs adapted to slide and rotate on said guides, elongated spur-gears which are rigidly connected with said hubs and arranged slidably on the guide, a horizontal worm-shaft, a hand-crank shaft, and intermediate mechanism connecting it with the worm-shaft, whereby the operator is enabled to shift the axles of the running wheels at different angles to the body of the vehicle, substantially as shown and described.

3. The combination, with a vehicle-body, and base-frame, of vertical guides located at the corners of the frame and vehicle-body, hubs mounted slidably and rotatably on said guides and provided with stub-axles, elongated gears rigidly connected with the hubs and similarly mounted on the guides, springs applied to the guides above the hubs and elastically supporting the weight of the vehicle-body and attachments, transverse shafts carrying worms which engage the elongated gears, a shaft arranged longitudinally of the frame and geared with the worm-shaft, and a crank-shaft geared with such longitudinal shaft and projecting upward in proximity to the seat of the vehicle, substantially as shown and described.

4. The combination, with a suitable frame and vertical guides supported thereon, of axle-hubs and elongated gears connected and adapted to slide and rotate on said guides, and means for rotating the axles, the engagement therewith being maintained irrespective of the vertical oscillation of the axles and hubs, substantially as shown and described.

5. The combination with the vehicle-body, the rigid frame and vertical shafts journaled in the latter, of hubs arranged on the shafts, axles journaled in the hubs and geared with the shafts, the said hubs being provided with worm-wheels and adapted to slide vertically on the shafts, springs arranged between the hubs and the frame and pressing upon the hubs, a worm-shaft geared with the hubs, and means for rotating the vertical shafts and also for rotating the hubs for swinging the axles in the horizontal planes, substantially as shown and described.

6. The combination of the vehicle-frame and vertical shafts journaled therein, of hubs which are adapted to slide vertically on the shafts, axles held rotatably in the hubs and geared with said shafts, means for rotating the hubs and thereby swinging the axles horizontally, the drive-shaft and bevel-gearing adapted for driving the aforesaid shafts, clutches for locking the driving-gears with the drive-shaft, and lever mechanism for adjusting said clutches whereby the driving mechanism is thrown into and out of gear, substantially as shown and described.

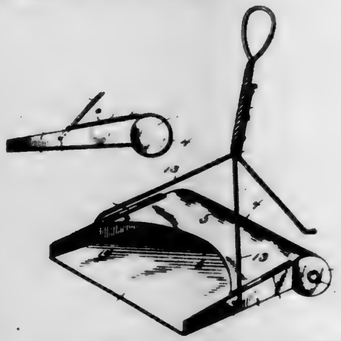
7. The combination with the vehicle-frame and vertical shafts journaled therein, and axles and hubs arranged rotatably as described, of gearing adapted to be connected with the drive-shaft, clutches for throwing the gearing into and out of action, a brake mechanism comprising a friction device, a cylinder, a piston, and lever mechanism connecting it with the brake proper, a valve for regulating admission of steam to the cylinder, and lever mechanism connected with the clutches and also with the valve whereby the clutches are engaged or disengaged, and the valve simultaneously shifted, correspondingly, for applying or releasing the brake, substantially as shown and described.

8. The combination with the vehicle-frame, vertical shafts, hubs adapted to rotate horizontally thereon, and axles held in said hubs and geared with the said shafts, of means for rotating the hubs and thereby swinging the axle horizontally as required for guiding the vehicle, a drive-shaft and loose gears and clutches mounted thereon, a single and double clutch adapted to engage the same, and lever mechanism connected with the clutches whereby, when the driving-wheels are unlocked, a reversing-wheel, 30, may be brought into action for reversing the rotation of one of the running wheels, substantially as shown and described.

9. The combination with the vehicle-frame and vertical shafts journaled therein, of the front and rear hubs and axles adapted to swing horizontally on said shafts and provided with worm-wheels arranged below the hubs, the said hubs being adapted to slide vertically on the shafts, worm-shafts geared with said wheels, a longitudinal shaft geared with said worm-shaft, a crank-shaft geared with said longitudinal shaft and arranged in proximity to the vehicle-seat, spiral springs applied to the shafts between the vehicle-body and the axle-hubs, a drive-shaft, gears for operatively connecting it with the vertical shafts, clutch mechanism for engaging such gears with the drive-shaft, lever mechanism for adjusting the clutches, and a brake mechanism consisting of the friction-brake proper, a piston-cylinder, piston and rod connecting it with the brake, a valve and means for connecting it with the aforesaid lever mechanism, whereby the valve is operated simultaneously with the shifting of the remaining portion of the lever mechanism by which the driving mechanism is thrown into and out of gear, substantially as shown and described.

10. The combination with the vehicle-body, the rigid frame and shafts journaled vertically therein, of hubs adapted to slide and rotate on the said shafts and provided with axles, springs interposed between the hubs and the vehicle-body, axles secured in said hubs, the hubs having hollow, polygonal, downward extensions surrounding the shafts, worm-wheels applied to such extensions and adapted to rotate therewith, but permitting the extensions to slide vertically, a worm-shaft geared with the said wheel, and means for rotating the said worm-shaft for the purpose of shifting the axles in horizontal planes for guiding of the vehicle, the engagement with the hubs being maintained in any vertical adjustment of the latter, substantially as shown and described.

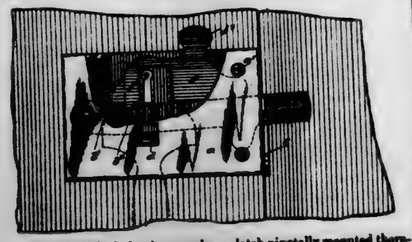
704,861. DUST-PAN. WILLIAM H. CORRELL, Holyoke, Colo. Filed Oct. 19, 1901. Serial No. 79,263. (No model.)



Claim.—1. The combination with a dust-pan, of a handle comprising a single wire bent centrally to form a loop and twisted upon itself below the said loop to form a grasp-coil, eyes in one of the strands of the said coil, and a brace-wire loosely mounted in the said eyes and having a stop at its upper end and a footpiece at its lower end.

2. The combination with a dust-pan, of a handle comprising a twisted wire formed with eyes, and a brace-wire extending through said eyes and having a stop at its upper end and a footpiece at its lower end.

704,862. LOCK. JAMES L. COULTER, Novina Center, N. Y. Filed Apr. 25, 1900. Renewed June 24, 1902. Serial No. 113,982. (No model.)



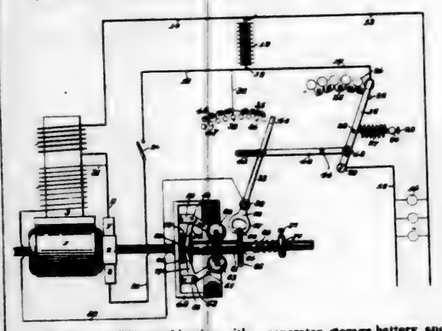
Claim.—1. A lock, having a casing, a latch pivotally mounted therein and formed with two indentations or recesses in its upper edge adjacent to its pivoted end, means for actuating the latch, and a tumbler capable of engagement at one end between the latch and a part of the casing to hold the latch in locked position, the forward portion of said tumbler being heavier than its rear portion and arranged to rest on the top of the latch, the tumbler having a rigid finger at its other end arranged to be lifted by a key to throw the tumbler, and the end of the finger bearing on the latch and being capable of engaging in either one of the recesses or indentations in the latch to hold the tumbler in active or inactive position.

2. A lock, comprising a casing, a latch pivoted at one end in said casing and formed with two indentations or recesses in its upper edge adjacent to its pivoted end, a thumb or finger plate for operating the latch, and a tumbler having a body portion resting on the top of the latch and provided with an extension at its forward end adapted to engage between the latch and a fixed part of the casing to hold the latch in locked position, an integral finger extending from the body portion of the tumbler at the opposite or rear end and having its lower end shaped to correspond with the recesses in the latch and arranged to engage either of said recesses to hold the latch in active or inactive position, the said finger end of the tumbler being adapted to be engaged by a key to lift the tumbler at said end and move the finger from one of said recesses to the other.

3. A lock, comprising a casing, a latch pivoted at one end in said casing and having two recesses therein adjacent to its pivoted end, means for operating the latch, and a tumbler resting on the latch and having an extension at one end adapted to engage between the latch and a stationary part of the casing to hold the latch in locked position, a finger at the other end of said tumbler and adapted to engage in either of said recesses in the latch, and an upward extension on said tumbler projecting through an opening in the top of the casing.

4. A lock, comprising a casing, a latch pivotally mounted in the casing, a tumbler working with said latch to hold it in locked position, and a thumb or finger plate for operating the latch, the said thumb or finger plate extending loosely through an opening in the casing and the door and having an upwardly-bent portion to prevent the turning of the thumb-plate in the opening in the door, and to hold the plate in position.

704,863. SYSTEM OF ELECTRICAL DISTRIBUTION. JOHN L. CREVELING, New York, N. Y. Filed Aug. 30, 1900. Serial No. 28,525. (No model.)



Claim.—1. The combination with a generator, storage battery, and translating device in electrical communication one with the other, of a resistance device and coöperative movable member in the work-circuit, and mechanical means for actuating said movable member proportionately to the rate of speed of the armature of the generator.

2. The combination with a generator, battery and translating devices, in electrical communication one with the other, of two variable resistances, one in the work-circuit and one in the field-circuit, movable members coöperative therewith, and mechanical means for actuating said members in proportion to the rate of speed of the generator.

3. The combination with a generator, battery and translating devices, in electrical communication one with the other, of variable resistances, one in the work-circuit and the other in the field-circuit, movable members coöperative with said resistances, respectively, and mechanical means for coregulating the currents in said circuits, respectively, by correlative movements of said members.

4. The combination with a generator, battery and translating devices, in operative communication one with the other, of a pair of variable resistances, one in the work-circuit and the other in the field-circuit, a pair of movable members coöperative with said resistances, respectively, an endwise-movable member operatively connected with said members, and centrifugally-actuated mechanism varying in speed with the armature-shaft of the generator, operatively connected with the endwise-movable member.

5. The combination with a generator, storage battery, and translating device in electrical communication one with the other, of a field-coil, variable resistances and movable members inserted respectively into the work or translating and field circuits, respectively, insulated, mechanical means uniting said movable members, and mechanical means for actuating said movable members relatively to the rate of speed of the armature of the generator.

6. The combination with a generator, storage battery and translating device, in electrical communication one with the other, of a field-coil, variable resistances and movable members inserted respectively, into the work or translating and field circuits, respectively, insulated mechanical means uniting said movable members, and mechanical means for actuating said movable members in successive order, relatively to the rate of speed of the armature of the generator.

7. The combination with a generator, storage battery, and translating device, in electrical communication one with the other, of a resistance device and coöperative movable member, inserted into the work-circuit, and centrifugally-actuated mechanism upon the armature-shaft of the generator, operatively connected with said movable member.

8. The combination with a generator, storage battery, and translating device, in electrical communication one with the other, and a field-coil, of resistance devices and mechanically-connected, but electrically-insulated, movable members, inserted, respectively, into said work or translating and field circuits, and centrifugally-actuated mechanism connected with the armature-shaft of the generator, operatively connected with said movable members.

9. The combination with a system of electrical distribution, comprising a generator, storage battery and translating devices, in electrical communication, and a field-coil, of mechanical means for coregulating the currents in the field and work circuits, relatively to the speed of rotation of the armature of the generator.

10. The combination with a system of electrical distribution comprising a generator, storage battery, and translating devices in electrical communication, and a field-coil, of resistance devices in the work and field circuits, respectively, and mechanical means of coregulating the currents in the field and work circuits through their respective resistances whereby the intensity of the translating devices may be held practically constant.

11. The combination with a generator, storage battery, and translating device, in electrical communication one with the other, and a battery field-coil, of a movable member intersecting the field-circuit, means for actuating said movable member relatively to the rate of speed of the armature-shaft of the generator, and a pair of variable resistances operatively disposed in the path of movement of the movable member, adapted respectively to diminish and increase the degree of resistance in the field-circuit through the continued movement of said movable member, substantially as and for the purpose specified.

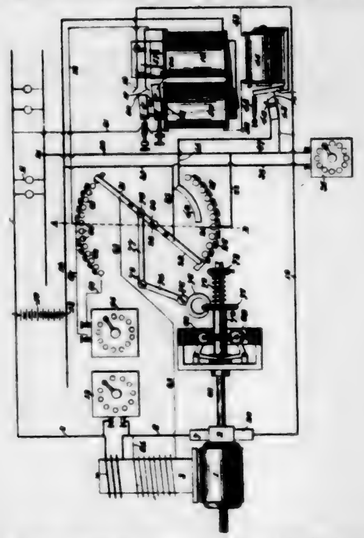
12. The combination with a generator, storage battery and translating device, in electrical communication one with the other, of a battery field-coil, resistance devices and coöperative movable members inserted into the translating and field circuits, respectively, a transversely-insulated link, movably secured to one of said members, and loosely united to the other, whereby continued movement of one of said movable members will actuate the other in successive order, and centrifugally actuated mechanism connected with the armature-shaft of the generator, operatively connected with one of said movable members, substantially as and for the purpose specified.

13. The combination with a generator, storage battery and translating device, in electrical communication one with the other, and a battery field-coil, of resistance devices and movable members, coöperative in successive order, inserted respectively, into the translating and field circuits, a loose sleeve upon the armature-shaft of the generator, operatively connected with one of said movable members, an adjustably-fixed spring upon said shaft opposed to the movement of said sleeve, and centrifugally-actuated mechanism upon said shaft, operatively connected with said sleeve, substantially as and for the purpose specified.

14. The combination with a generator, storage battery and translating devices, in electrical communication one with the other, a battery lamp-circuit being defined between the battery and translating devices, of mechanical means for regulating the lamp-circuit by the speed of the generator, whereby the voltage of the lamp-circuit is kept practically constant, notwithstanding variations of the voltage in the generator and generator-circuit, due directly to the said variations in speed.

704,864. SYSTEM OF ELECTRICAL DISTRIBUTION. JOHN L. CREVELING, New York, N. Y. Filed Dec. 7, 1900. Serial No. 39,052. (No model.)

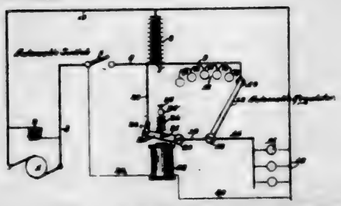
Claim.—1. The combination with a system of electrical distribution, comprising a generator, storage battery and translating devices in electrical communication through a main circuit, the battery dividing from the main circuit, in effect, a lamp-circuit deriving energy directly through the battery, of means for increasing or diminishing resistance in the lamp-circuit upon increase or decrease of battery-current to the field-circuit.



2. The combination with a system of electrical distribution, comprising a generator, storage battery, and translating devices, in electrical communication through a main circuit, and a field-coil, of resistance devices in the main and field circuits, respectively, means for coregulating the currents in the main and field circuits through their respective resistances, and an additional rheostat in shunt across the respective resistances.

3. The combination with a system of electrical distribution, comprising a generator, storage battery, and translating devices, in electrical communication through a main circuit, a field-coil, and means of coregulating the currents in the field and main circuits, respectively, proportionately to the rate of speed of the generator, of means for short-circuiting the variable-resistance main circuit, in case of failure of current in the generator main circuit.

704,865. SYSTEM OF ELECTRICAL DISTRIBUTION. JOHN L. CREVELING, New York, N. Y. Filed Dec. 7, 1900. Serial No. 39,050. (No model.)



Claim.—1. The combination with a generator comprising a rotative member, a storage battery and a work or translating circuit, of a regulator in said circuit dependent upon the speed of rotation of said rotative member, and independent means of nullifying the effect of the regulator whenever the generator is ineffective.

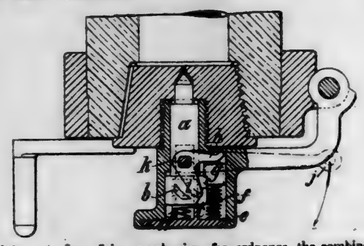
2. The combination with a generator comprising a rotative member, a storage battery and a work or translating circuit, of a regulator in said circuit dependent upon the speed of rotation of said rotative member, and independent means of cutting out the regulator whenever the generator is ineffective.

3. The combination with a generator comprising a rotative member, a storage battery and a work or translating circuit, of a regulator in said circuit dependent upon the speed of rotation of said rotative member, independent means of cutting out the regulator whenever the generator is

ineffective, and electromagnetic means for inserting the regulator when the generator is in effective operation.

4. The combination with a generator comprising a rotative member, a storage battery and a work or translating circuit, of a regulator in said circuit dependent upon the speed of rotation of said rotative member, a shunt-circuit around the regulator, and independent automatic means for controlling said shunt-circuit.

704,866. **FIRING-GEAR FOR ORDNANCE.** KARL DEHELEIS, Pilsen, Austria-Hungary, assignor to Skodawerke Actiengesellschaft, in Pilsen, Pilsen, Austria-Hungary, a Firm. Filed Dec. 26, 1901. Serial No. 87,261. (No model.)



Claim.—1. In a firing mechanism for ordnance, the combination with a breech-block, of a striker arranged therein, a spring for operating said striker, a projection carried by the striker, a cocking device consisting of a bell-crank lever having one arm thereof during its passage in one direction engaging said projection to compress the spring to cause the operation of the striker when the said arm has passed out of engagement with said projection, means for oscillating said cocking device, a second projection carried by the striker and adapted to be engaged by the said arm in its passage in the opposite direction for returning the striker to its position of rest, and means engaging the cocking device for returning the same to its normal position and causing the said arm to engage with the said second projection.

2. In a firing mechanism for ordnance, the combination with a breech-block, of a striker arranged therein, a spring for operating said striker, a projection carried by the striker, a cocking device consisting of a bell-crank lever having one arm thereof during its passage in one direction engaging said projection to compress the spring to cause the operation of the striker when the said arm has passed out of engagement with said projection, means for oscillating said cocking device, a second projection carried by the striker and adapted to be engaged by the said arm in its passage in the opposite direction for returning the striker to its position of rest, means engaging the cocking device for returning the same to its normal position and causing the said arm to engage with the said second projection, and mechanism for preventing the operation of the striker until the breech-block is completely closed.

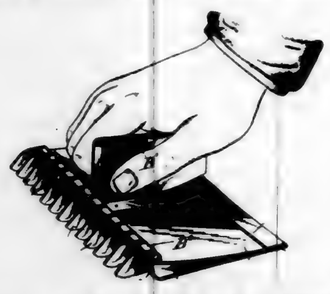
3. In a firing mechanism for ordnance, the combination with a breech-block, of a striker arranged therein, a spring for operating said striker, a projection carried by the striker, a cocking device engaging said projection during its passage in one direction and adapted to compress the said spring to cause the operation of the striker when the cocking device has passed out of engagement with the said projection, means for oscillating said cocking device, a second projection carried by the striker and adapted to be engaged by the cocking device in its passage in the opposite direction for withdrawing the striker and returning the same to its position of rest, and means engaging with the cocking device for returning it to its normal position and for causing the engagement of the cocking device with the second projection, substantially as described.

4. In a firing mechanism for ordnance, the combination with a breech-block, of a striker arranged therein, a spring for operating said striker, a projection carried by the striker, a cocking device engaging said projection during its passage in one direction and adapted to compress the said spring to cause the operation of the striker when the cocking device has passed out of engagement with the said projection, means for oscillating said cocking device, a second projection carried by the striker and adapted to be engaged by the cocking device in its passage in the opposite direction for withdrawing the striker and returning the same to its position of rest, means engaging with the cocking device for returning it to its normal position and for causing the engagement of the cocking device with the second projection, and mechanism for preventing the operation of the striker until the breech-block is completely closed, substantially as herein shown and described.

5. In a firing mechanism for ordnance, the combination with a breech-block, of a striker arranged therein, a guide for the said striker, a spring for operating said striker, a projection carried by the striker, a cocking device adapted to engage the said projection during its passage in one direction for compressing the spring to cause the operation of the striker when the cocking device has passed out of engagement with the said projection, a second projection carried by the striker, a spring arranged in the breech-block and adapted to be compressed during the operation of the cocking device in one direction and for causing the return of the cocking device to its normal position and for causing the cocking device to engage the second projection for withdrawing the striker to its position of rest, and means for operating said cocking device.

6. In a firing mechanism for ordnance, the combination with a breech-block, of a striker arranged therein, a guide for the said striker, a spring for operating said striker, a projection carried by the striker, a cocking device adapted to engage the said projection during its passage in one direction for compressing the spring to cause the operation of the striker when the cocking device has passed out of engagement with the said projection, a second projection carried by the striker, a spring arranged in the breech-block and adapted to be compressed during the operation of the cocking device in one direction and for causing the return of the cocking device to its normal position and for causing the cocking device to engage the second projection for withdrawing the striker to its position of rest, means for operating said cocking device, and mechanism for preventing the operation of the striker until the breech-block is completely closed.

704,867. **PILL-MAKING MACHINE.** JULIUS H. DEWS, Portsmouth, Va. Filed Dec. 7, 1901. Serial No. 85,011. (No model.)



Claim.—1. The pill-making machine herein described consisting of the base-section composed of a plate provided at its front edge with tongues spaced apart for the cutters and at its rear edge with a returned portion forming a keeper and the cutter-section having its rear edge fitted detachably in the keeper of the base-plate and its front edge normally sprung apart from the base-plate and provided with blades operating between the tongues of the said base-plate substantially as set forth.

2. The combination in a pill-making machine of the base-section provided at its rear edge with a forwardly-opening keeper and the cutter-section fitted at its rear edge detachably in said keeper and provided at its front edge with blades for dividing the mass into sections substantially as set forth.

3. A pill-making machine comprising the base, the cutter-section held at its rear edge to the base and provided at its front edge with blades and sprung at its front edge normally away from the base and the handle secured at its front end to the cutter-section and elongated in the direction of the blades, and free at its rear end from the cutter-section whereby the said handle may operate with a lever action, substantially as set forth.

4. A pill-making machine consisting of the base provided at its front edge with a spaced-apart tongue and the cutter-section held at its rear edge to the base and provided with a transverse roll and with blades projecting therefrom at the front edge of the cutter-section substantially as set forth.

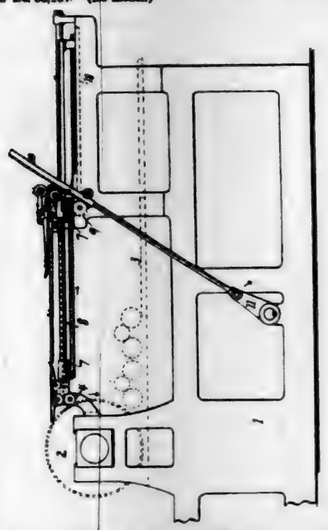
5. A pill-making machine consisting of the base-plate having a returned rear edge forming a keeper and provided at its front edge with the upwardly and forwardly projecting tongues spaced apart and the cutter-section fitting at its rear edge detachably in the keeper formed by the returned edge of the base-section and provided at its front edge with blades operating between the tongues of the base-section substantially as set forth.

6. A pill-making machine comprising a base-section and a cutter-section held together at their rear edges and sprung apart at their opposite edges and a handle secured at its front end to the cutter-section and having a rearward extension whereby it may operate with a lever action substantially as set forth.

7. A pill-making machine consisting of base and cutter sections, one

of said sections being provided at its rear edge with a forwardly-opening keeper for receiving the rear edge of the other section substantially as set forth.

704,868. **SHEET-DELIVERY APPARATUS FOR PRINTING PRESSES.** GEORGE P. PRESSEY, New London, Conn. Filed Jan. 2, 1902. Serial No. 88,167. (No model.)



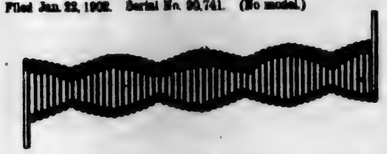
Claim.—1. A reciprocating carriage having a shaft, a curler and curler-roll mounted on the shaft, a driving-gear and rack for the curler-roll, a presser-roll, a supporting-arm for the presser-roll mounted on the carriage, and a lifting-arm and incline for the presser-roll substantially as described.

2. A delivery-tape, a reciprocating carriage made to take a sheet from the tape, a curler-shaft on the carriage, a curler-roll and curler on the shaft, a presser-roll, and a lifting-arm and incline for moving the presser-roll out of action, said presser and curler roll being made to feed a sheet to the curler for reversing or bending down the printed side of the sheet substantially as described.

3. A reciprocating carriage having a shaft with a curler, a curler-roll and curler-roll-driving gear all mounted on said shaft, said curler being removable or dismountable substantially as described.

4. A reciprocating carriage having a shaft with arms extended upward and forward therefrom, a front roller on the shaft, a cross-shaft on said arms, a curler on said cross-shaft made to clasp the upper and lower front portion of the front roller, and a gear for driving the front roller.

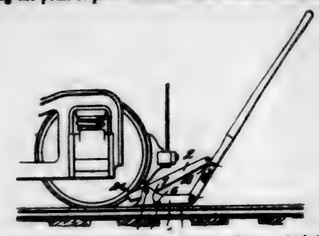
704,869. **COUPLING FOR WIRES, CONDUCTORS, OR THE LIKE.** JACOB FISCHER and HERMANN SCHNEIDER, Solothurn, Switzerland. Filed Jan. 22, 1902. Serial No. 90,741. (No model.)



Claim.—A wire or conductor coupler consisting of a flexible sleeve of helically-wound wire the coils of which when in a free state form the walls of a spirally-shaped socket so that when the ends of this sleeve-coil are turned back the ends of the wires or conductors may be inserted into the interior of this sleeve-coil, the interior of which now forms an approximately straight bore, and by releasing the ends of the coil the ends of the wires or conductors are gripped and held fast in consequence of the torsion in the sleeve-coil.

704,870. **CAR-MOVER.** CHARLES D. FOX, Appleton, Wis. Filed Feb. 24, 1902. Serial No. 95,394. (No model.)

Claim.—1. A car-mover, comprising a base or shoe, a pinch-bar fulcrumed thereto, an operating-lever also fulcrumed thereto, a link pivotally connecting said pinch-bar with said operating-lever, and means for changing the point of pivotal connection of said link with said lever.



2. A car-mover, comprising a base or shoe, a pinch-bar fulcrumed thereto, an operating-lever also fulcrumed thereto having an elongated slot therein and a plurality of openings extending transversely of and intersecting said slot, a link pivoted to said pinch-bar fitting within said slot, and a removable pivot pin or bolt extending through one or the other of said openings, and through said link.

3. In a car-mover, a base or shoe having a plurality of separated arms, and a yieldingly-supported roller mounted in and movable between said arms and normally projecting below the lower surface of said shoe.

4. In a car-mover, a base or shoe having a plurality of separated arms, a roller bodily movable in and between said arms and normally projecting below the lower surface of said shoe, and a spring for resisting the upward movement of said roller.

5. In a car-mover, a base or shoe having a plurality of separated arms, a spur or projection on the under side thereof, and a yieldingly-supported roller mounted in and between said arms and normally projecting below the lower surface of said shoe.

6. In a car-mover, a base or shoe having a plurality of separated arms, a spur or projection on the under side thereof, a roller bodily movable in and between said arms and normally projecting below the lower surface of said shoe, and a spring for resisting the upward movement of said roller.

7. In a car-mover, a base or shoe having two parallel arms, a roller vertically movable between said arms and normally projecting below the lower surface of said shoe, and a spring secured to said shoe and acting upon said roller for resisting the upward movement thereof.

8. In a car-mover, a base or shoe having two parallel arms, a roller vertically movable between said arms and normally projecting below the lower surface of said shoe, a cross-bar connecting said arms, and a spring secured to said cross-bar and acting upon said roller for resisting the upward movement thereof.

9. In a car-mover, a base or shoe having two parallel arms provided with grooves along their inner surfaces, a roller normally projecting below the lower surface of said shoe and having its shaft or axis fitting within said grooves, and a spring acting upon said roller for resisting its upward movement.

10. In a car-mover, a base or shoe bifurcated or slotted to form two parallel, vertically-disposed arms, having grooves in the inner surfaces thereof terminating at their lower ends in shoulders, a roller normally projecting below the lower surface of said shoe and having its shaft or axis fitting within said grooves and adapted to engage said shoulders, a bearing-block for said roller movable in said grooves, and a spring acting upon the upper end of said bearing-block.

704,871. **BICYCLE ATTACHMENT.** JOHN B. DAVIS, Dayton, Ohio, assignor of one-half to W. J. Peters and H. B. Peters, Troy, Ohio. Filed Mar. 14, 1902. Serial No. 98,160. (No model.)

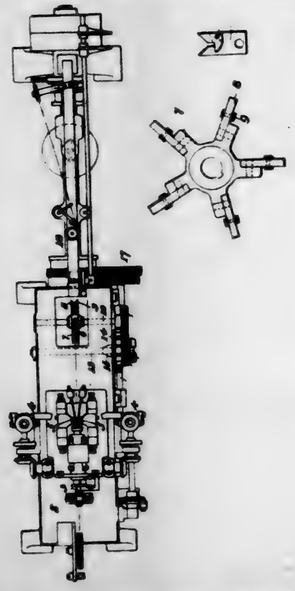
Claim.—1. In an attachment for loading bicycles in the rear of vehicles, the combination with the steering-fork of a bicycle, a horizontal fork having a connection with said steering-fork, a bow or yoke having

a pivotal connection with said horizontal fork, hooks or angular arms connected to the ends of said bow or yoke, said hooks or angular arms being adapted to inclose a vehicle-axle, a saddle adapted to inclose the upper portion of a vehicle-axle, and a spring connected to the median portion of said bow or yoke and to which said saddle is loosely connected the said spring serving to maintain said saddle in rigid contact with the vehicle-axle and to permit of the yielding motion of the attachment due to the moving vehicle, substantially as specified.

2. In a device for loading bicycles in the rear of vehicles, the combination with the steering-fork of a bicycle, a horizontal fork having a pivotal connection with said steering-fork, a yoke or bow having a pivotal connection with said horizontal fork, hooks or angular arms having swivel and spring-controlled connections with the ends of said bow or yoke, the said hooks or angular arms being adapted to be moved into two positions and to be locked in such positions, one of said positions securing the attachment to the rear axle of a vehicle, a saddle adapted to inclose the upper portion of said vehicle-axle between the said hooks or angular arms, a spring attached to the median portion of said bow or yoke, said spring having an extended portion to which the saddle is movably attached, and the said extended portion exerting pressure to maintain the saddle in rigid contact with the upper portion of the vehicle-axle, substantially as specified.

3. In a device for loading bicycles in the rear of vehicles, the combination of a fork adapted to be attached to the steering-fork of a bicycle, a bow having a spring-controlled and swivel connection with said fork, hooks or angular arms attached to the ends of said bow, a pin and slot on the adjacent ends of said bow and the angular arms by means of which said angular arms are locked in and out of operative positions, springs controlling said angular arms when in such locked positions, the said angular arms when in operative positions inclosing the rear axle of a vehicle and serving to prevent a disconnection of the attachment from the vehicle-axle when the vehicle is moving, a saddle inclosing the upper side of the vehicle-axle, a spring secured to the median portion of the bow, the said spring having an extended portion to which the saddle is loosely connected and by means of which the said saddle is maintained rigidly against the upper side of the vehicle-axle, substantially as specified.

704,872. **WIRE-BARBING MACHINE.** WILLIAM H. FARRELL, Donora, Pa. Filed Dec. 12, 1901. Serial No. 85,565. (No model.)



Claim.—1. In a wire-barbing machine, a pull-out wheel having grippers formed of two or more members, one of which at least is movable, the movable member or members being actuated to grip the wire by the pressure of the wire thereon caused by the tension on the wire.

2. In a wire-barbing machine, a pull-out device having grippers formed of two or more members, one of which at least is movable, the movable member or members being composed of a bell-crank lever or levers, one arm of such lever being adapted to have the wire rest thereon.

3. In a wire-barbing machine, a pull-out wheel having grippers formed of two or more members, one of which at least is movable, the movable member or members being actuated to grip the wire by the pressure of the wire thereon caused by the tension on the wire, a twister, and a yielding butterfly-wheel between the pull-out wheel and the twister.

704,873. **MEANS FOR CLOSING JARS.** GEORGE H. FOX, Bangor, Me. Filed Nov. 16, 1901. Serial No. 82,541. (No model.)

Claim.—1. The combination of a jar provided with openings at both ends, closures for said openings, and a locking device attached to and serving as a carrier for one of said closures and adapted to engage the other closure; said jar having a vertical notched flange which extends beyond the plane of the attached closure and serves to protect the latter and to hold the locking device in position on the jar.

2. The combination of a jar provided with openings at both ends, closures for said openings, and a locking device attached to and serving as a carrier for the bottom closure and adapted to engage the top closure; said jar having a vertical notched flange which extends beyond the plane of the attached closure and serves to protect the latter and to hold the locking device in position on the jar.

3. The combination of a jar provided with openings at both ends, closures for said openings, and an elastic locking device attached to and serving as a carrier for one of said closures and adapted to engage the other closure; said jar having a vertical notched flange which extends beyond the plane of the attached closure and serves to protect the latter and to hold the locking device in position on the jar.

4. The combination of a jar provided with openings at both ends and with a flange at one end having notches, closures for said openings, and a continuous bail engaging said notches and extending around said jar and over both closures, the lower closure being attached to said bail and carried thereby.

5. The combination of a jar provided with a top opening and with a bottom having a small opening, said jar being provided at its bottom with a downwardly-extending notched flange, a notched cover for said top opening, a stopper for the small bottom opening, the outer end of said stopper being above the plane of said flange, and a continuous bail for securing said cover and stopper extending around said jar and engaging said stopper and the notches of said flange and cover.

6. The combination of a jar provided with openings at both ends and having a downwardly-extending peripheral flange at the bottom thereof, said flange having oppositely-disposed notches therein, closures for said openings, and a bail attached to the bottom closure and adapted to extend over the top closure, said bail fitting in said notches.

7. A bail forming a complete circuit and adapted to extend around a jar, said bail having a handle at one end, a stopper independent of the circuit attached to the other end and spring-loops formed in said bail between said stopper and handle, whereby the bail is clamped around the jar.

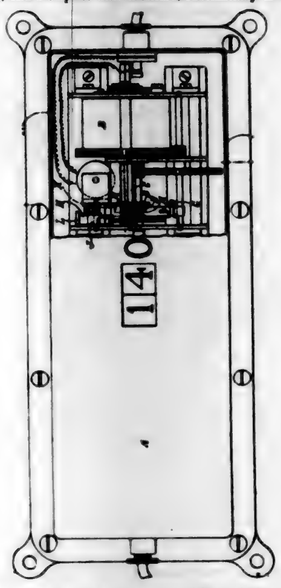
8. A bail forming a complete circuit in one continuous piece and adapted to surround a jar, said bail having a loop in one end thereof adapted to serve as a handle, and having its terminal ends fastened together and provided with a stopper independent of the circuit.

9. A bail forming a complete circuit adapted to surround a jar, said bail having a loop-handle formed in one end, a stopper attached to the other end independent of said circuit and springs formed in said bail at opposite sides between said handle and stopper.

704,874. **ESCAPEMENT FOR ELECTROMAGNETICALLY-CONTROLLED CLOCKS.** HERBERT H. GRENFELL, London, England. Filed Feb. 5, 1902. Serial No. 92,687. (No model.)

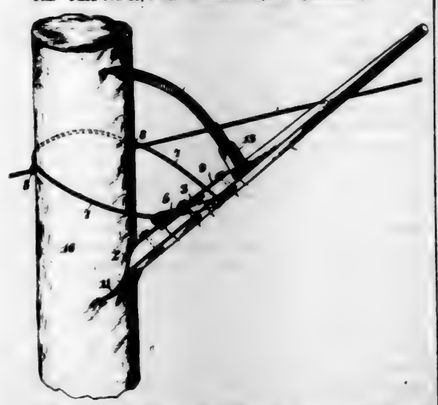
Claim.—1. In an electromagnetically-controlled clock-movement, the combination, with an arbor of said movement, of a pin connected to said arbor, a slotted detent-bar forming a stop for said pin, but allowing the pin to pass through the slot as the said bar is moved to and fro, guides in which said bar can slide, a spring-controlled armature pivotally mounted between the poles of an electromagnet, and connected to the detent-bar, and said electromagnet, substantially as described.

2. In an electromagnetically-controlled clock-movement, an escapement consisting of a radial arm fixed on an arbor of said movement, a pin projecting from said arm substantially parallel to said arbor, a slotted detent-bar forming a stop for said pin, but allowing the pin to pass through the slot when the said bar is moved to and fro, guides in which said bar can slide, a spring-controlled armature pivotally mounted between the poles of an electromagnet and pivotally connected to the detent-bar, said electromagnet, and a stop for said armature, substantially as described.



3. In a drum signaling device actuated by a clock-movement, the combination with the clock-movement and the drum-axle, of an electromagnetically-controlled escapement comprising an electromagnet, an armature pivoted between the poles of said magnet, a spring for controlling the armature, a stop to limit the turning movement of the armature in one direction, a slotted detent-bar pivotally connected to the armature, guides for said detent-bar, and a pin connected to one arbor of the clock-work-train and adapted to rest upon the detent-bar and to pass through the slot therein as said bar is moved to and fro, substantially as described and for the purpose specified.

704,875. **WIRE-STRETCHER.** WILLIAM M. HALPAIN, Hamilton, Tex. Filed Oct. 10, 1901. Serial No. 78,722. (No model.)



Claim.—1. A wire-stretcher, comprising a lever, a swinging cross-head disposed transversely of the lever and having an intermediate fulcrum connection therewith, whereby the cross-head is capable of swinging in a direction endwise of the lever, and wire-engaging links loosely carried by the opposite ends of the cross-head.

2. A wire-stretcher comprising a lever having a socket or recess formed in the upper side thereof, a cross-head mounted within the recess, a metal strap secured across the recess and projected at the adjacent end of the lever to form a fulcrum therefor, and wire-engaging hooks loosely connected to the outer ends of the cross-head.

3. A wire-stretcher comprising a lever having a beveled end and a recess formed adjacent to said end and in the upper face thereof, a cross-head mounted in the recess, a metal strap secured across the recess, conformed to the beveled end of the lever and projected beyond the latter to form a fulcrum-point, a pivot-bolt piercing the lever, the cross-head and the strap, and wire-engaging links loosely connected to the opposite ends of the cross-head.

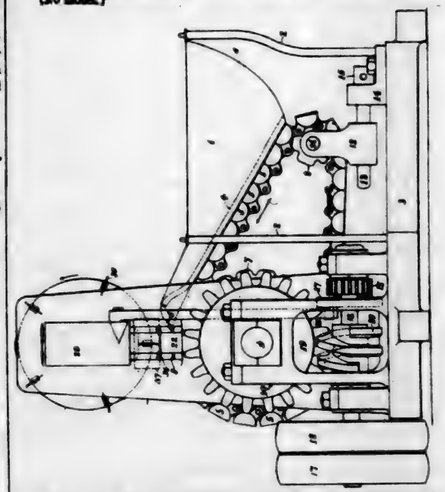
4. A wire-stretcher, comprising a wooden lever having a beveled end and a recess formed adjacent to said end and in the upper face of the lever, a metal plate secured across the recess formed in the beveled end of the lever and having a projected bifurcated end to form a fulcrum, a cross-head fitted in the recess, a pivot piercing the lever, the cross-head and the metal strap, links loosely connected to the opposite ends of the cross-head and having outer terminal hooks, and a prop pivoted to the lever and located outwardly from the cross-head.

5. A wire-stretcher, comprising a lever, an intermediately-pivoted cross-head carried thereby, wire-engaging links connected to the opposite ends of the cross-head, and correspondingly-beveled stop-shoulders located at opposite sides of the cross-head and in the path of the swinging movement thereof.

6. A wire-stretcher, comprising a lever having a recess formed therein, the opposite ends of the recess being pointed to form correspondingly-beveled stop-shoulders, a cross-head pivoted intermediately in the recess and capable of contact with the corresponding stop-shoulders, and wire-engaging links carried by the opposite ends of the cross-head.

7. A wire-stretcher, comprising a lever having a recess formed therein, the opposite ends of the recess being pointed to form correspondingly stop-shoulders, a cross-head pivoted intermediately in the recess and capable of contact with the shoulders, and a metal strap secured across the recess and projected beyond the adjacent end of the lever to form a fulcrum therefor.

704,876. **MACHINE FOR REMOVING STONES FROM CHERRIES OR OTHER SINGLE-STONED FRUIT.** WILLIAM P. HARRIS, London, England, assignor to the Fruit Stoning and Preserving Syndicate, Limited, London, England. Filed Feb. 24, 1902. Serial No. 96,280. (No model.)



Claim.—1. The combination of a reciprocatory stone-extractor for entering and withdrawing the stone from the fruit and an extractor-clearer for freeing the withdrawn stone from the extractor.

2. The combination of a reciprocatory stone-extractor for withdrawing the stone and a fruit-retainer for the fruit to bear against during withdrawal of the stone therefrom and an extractor-clearer for freeing the withdrawn stone from the extractor.

3. The combination of a reciprocatory stone-extractor for withdrawing the stone and a fruit-retainer for the fruit to bear against during withdrawal of the stone therefrom and an extractor-clearer for freeing the withdrawn stone from the extractor and a rotary stone-discharger for removing the freed stone from the machine.

4. A reciprocatory stone-extractor provided with sharp edges partially for entering and cutting open the skin and pulp of the fruit at one side of the stone and partially for engaging with and withdrawing the stone through the opening cut.

5. A reciprocatory stone-extractor comprising spring-tongues for piercing the fruit and embracing the stone therein and projections on the said tongues for retaining the stone in the embrace of the extractor.

6. A reciprocatory stone-extractor comprising spring-tongues for piercing the fruit and embracing the stone therein and projections on the said tongues for retaining the stone in the embrace of the extractor and blades for cutting open the skin and pulp of the fruit between the spring-tongues and the stone to permit of exit of the stone with the extractor on withdrawal of the latter from the fruit.

7. An extractor-clearer for freeing withdrawn stones carried by a reciprocating stone-extractor such clearer consisting of a plate situated in the path of motion of the stone-extractor.

8. In a machine of the character described, the combination of a reciprocatory stone-extractor for partially entering and withdrawing the stone from the fruit, a conveyer for feeding the fruit to the extractor, a pair of sprocket-wheels for supporting the conveyer, said wheels of different diameters, a shaft for operating the sprocket-wheel of larger diameter, a peg-wheel for operating said shaft, means engaging with the said peg-wheel for intermittently operating it, means for operating the stone-extractor, and an extractor-clearer for freeing the withdrawn stone from the extractor.

9. In a machine of the character described, a reciprocatory stone-extractor comprising spring-tongues for piercing the fruit and embracing the stone therein and projections on the said tongues for retaining the stone in the embrace of the extractor, and an extractor-clearer for freeing the withdrawn stones from the extractor.

10. In a machine of the character described, a reciprocatory stone-extractor comprising spring-tongues for piercing the fruit and embracing the stone therein and projections on the said tongues for retaining the stone in the embrace of the extractor, an extractor-clearer for freeing the withdrawn stones from the extractor, and a rotary stone-discharger for removing the freed stone.

11. A reciprocatory stone-extractor comprising spring-tongues for piercing the fruit and embracing the stone therein and projections on the said tongues for retaining the stone in the embrace of the extractor and blades for cutting open the skin and pulp of the fruit between the spring-tongues and the stone to permit of exit of the stone with the extractor on withdrawal of the latter from the fruit, and an extractor-clearer for freeing the withdrawn stones from the extractor.

12. A reciprocatory stone-extractor comprising spring-tongues for piercing the fruit and embracing the stone therein and projections on the said tongues for retaining the stone in the embrace of the extractor and blades for cutting open the skin and pulp of the fruit between the spring-tongues and the stone to permit of exit of the stone with the extractor on withdrawal of the latter from the fruit, an extractor-clearer for freeing the withdrawn stones from the extractor, and a rotary stone-discharger for removing the freed stone.

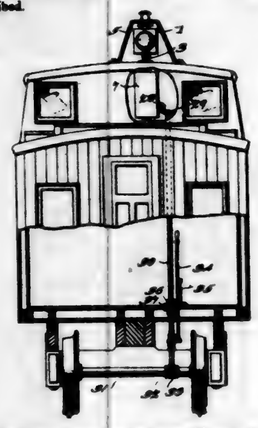
13. In a machine of the character described, a standard, a rod carried thereby, a slide mounted upon the rod, guides for the said slide, means for imparting a vertical reciprocatory motion to said slide, a stone-extractor carried by the said slide and adapted to partially enter and withdraw the stone from the fruit, means for feeding the fruit to be stoned to the said extractor, and an extractor-clearer for freeing the withdrawn stone from the extractor.

14. In a machine of the character described, a standard, a rod carried thereby, a slide mounted upon the rod, guides for the said slide, means for imparting a vertical reciprocatory motion to said slide, a stone-extractor carried by the said slide and adapted to partially enter and withdraw the stone from the fruit, means for feeding the fruit to be stoned to the said extractor, an extractor-clearer for freeing the withdrawn stone from the extractor, and a rotary stone-discharger for removing a freed stone from the machine.

704,877. AUTOMATIC RAILWAY-SIGNAL. WALTER L. HARPER, Mena, Ark. Filed Feb. 25, 1902. Serial No. 95,567. (No model.)

Claim.—1. A device of the class described comprising a rotary signal designed to be mounted on a train, gearing for connecting the signal with one of the axles, and means for automatically rotating the signal when the train stops, whereby the signal will display its lights in a predetermined manner, substantially as described.

2. A device of the class described comprising a rotary signal designed to be mounted on a train and to be rotated when the train is in motion, and means for automatically actuating the signal when the train stops to display a danger-signal in a predetermined direction, substantially as described.



3. A device of the class described comprising a rotary signal, a shaft carrying the signal, a stationary gear-wheel, upright revolving gears offset from the shaft and meshing with the stationary gear, a rotary gear also meshing with the revolving gears, means for connecting the rotating gear with a car-axle, and a rotary weight connected with the said shaft and adapted to return the same to its initial position, substantially as and for the purpose described.

4. A device of the class described comprising a rotary signal designed to be mounted on a train and provided with a plurality of lights of different colors, gearing for rotating the signal while the train is in motion, and a rotating weight connected with the signal and adapted to return the same to its initial position when the train stops, substantially as described.

5. A device of the class described comprising a rotary signal having a plurality of different-colored lights, gearing for rotating the signal while the train is in motion, and a shaft having a weighted arm and connected with the said gearing, said weighted arm being adapted to return the signal to its initial position, substantially as described.

6. A device of the class described comprising a rotary globe or lantern-casing provided with a plurality of transparent panes or bull's-eyes of different colors, a stationary lighting device supported within the globe or casing, and means for rotating the globe or casing when a train is in motion, and for stopping the globe or lantern-casing in a predetermined position when the train stops, substantially as described.

7. A device of the class described comprising an upright signal-carrying shaft provided with arms, a stationary horizontal gear, a rotary horizontal gear designed to be connected with an axle of a train, whereby the device will be operated when the train is in motion, gears mounted on the arms, and meshing with the said horizontal gears, a horizontal shaft having a weighted arm, and gearing connecting the horizontal shaft with the upright shaft, substantially as described.

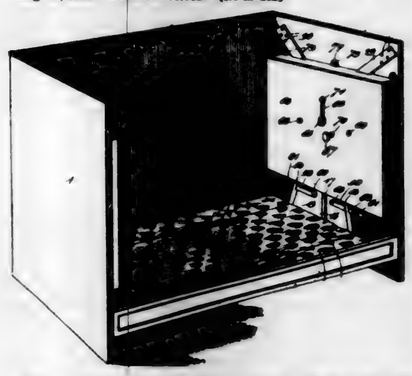
8. A device of the class described comprising an upright signal-carrying shaft carrying an arm, the stationary and rotary horizontal gears, gears mounted on the arm and meshing with the said gears, and means for returning the upright shaft to its initial position when the train stops, substantially as described.

9. A device of the class described comprising an upright shaft, a lantern globe or casing detachably interlocked with the shaft and provided with a plurality of transparent panes of different character, a bracket, a stationary lighting device supported by the bracket within the globe or casing, gearing for rotating the upright shaft when a train is in motion, and means for returning the globe or casing to its initial position when the train stops, substantially as described.

10. A device of the class described comprising an upright rotary-signal-carrying shaft, a signal mounted on the shaft, arms extending from the same, upright gears mounted on the arms, stationary and rotary horizontal gears meshing with the upright gears, a shaft 30 extending to the bottom of the car, gearing for connecting the shaft 30 with the rotary horizontal gear and with one of the axles, means for throwing the shaft 30 into and out of gear and means connected with the signal-carrying shaft for returning the signal to its initial position when the train stops, substantially as described.

11. A device of the class described comprising a signal-carrying shaft, a shaft 30 extending to the bottom of the car, gearing for connecting the shaft 30 with one of the axles and with the signal-carrying shaft, a bearing receiving the shaft and mounted on the car-body, and springs cushioning the bearing, substantially as described.

704,878. SHIP'S BERTH. ADDISON W. HITT, San Francisco, Cal., assignor of one-half to Charles B. Naylor, San Francisco, Cal. Filed Aug. 12, 1901. Serial No. 71,816. (No model.)



Claim.—1. The combination with a swinging berth, of pivoted buffers operatively connected with the berth-supports, and motion-controlling springs disposed for flexure in planes parallel with those of the buffers.

2. The combination with a swinging berth, of pivoted buffers operatively connected with the berth-supports, motion-controlling springs cooperating with the buffers, and means for increasing or diminishing the resistance to flexure of said springs.

3. The combination with a three-part bed-bottom frame, of braces secured to the center section thereof and having their upper ends supported for swinging movement, fixed extensions projecting beyond the braces, and swinging buffers pivotally connected with said extensions.

4. The combination with a three-part bed-bottom frame, of braces secured to the center section thereof and having their upper ends supported for swinging movement, fixed extensions projecting beyond the braces, swinging buffers pivotally connected with the said extensions, and motion-controlling springs cooperating with the braces.

5. The combination with a bed-bottom frame, of braces secured thereto and having their upper ends supported for swinging movement, fixed extensions projecting beyond the braces, swinging buffers pivotally connected with said extensions, motion-controlling springs cooperating with the braces, and means for increasing or diminishing the resistance to flexure of the said springs.

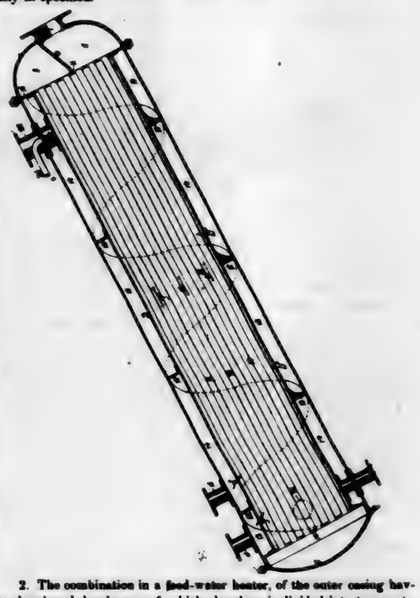
6. In a ship's berth, a bed-bottom comprising a frame composed of a fixed center section and hinged side sections, drop-rods rigidly associated with the center sections and pivotally associated with the side sections, a wire mattress suitably associated with the said sections, a three-part mattress supported upon the frame, head and foot boards associated with the center section of the frame and hung for swinging movement, gravity-catches carried by the head and foot boards and having means associated therewith for operating the same, and projections of the side pieces of the frame to engage with the gravity-catches to hold the side pieces turned at right angles to their normal positions.

7. In a ship's berth, a bed-bottom comprising a frame composed of a fixed center section and hinged side sections, drop-rods rigidly associated with the center section and pivotally associated with the side sections, a wire mattress suitably associated with the three sections, and a three-part mattress supported upon the wire mattress.

8. In a ship's berth, a bed-bottom frame supported for swinging movement and having foldable sides, in combination with means carried by the frame-support for engaging the sides to hold them turned at right angles to their normal positions.

704,879. FEED-WATER HEATER. RAYMOND H. HOUSEHOLDER, Canton, Ohio. Filed Mar. 27, 1902. Serial No. 100,231. (No model.)

Claim.—1. The combination, in a feed-water heater, of an outer casing having chambered heads, an inner casing containing a chamber having inlet and outlet and closed at its opposite ends by tube-sheets whereby said internal chamber is separated from the chambered heads of the casing, tubes connecting said sheets and passing through the chamber within the inner casing, and means whereby fluid is caused to flow through the chamber between the inner and outer casings and between the tube-sheets of the heater and through the tubes of the same, substantially as specified.



2. The combination in a feed-water heater, of the outer casing having chambered heads, one of which chambers is divided into two parts, an inner casing containing a chamber with inlet and outlet, tube-sheets closing the opposite ends of said inner casing, and separating the chamber within the same from the chambers within the heads of the outer casing, tubes extending through said internal chamber and connecting the opposite tube-sheets, both sets of tube-sheets communicating with the chamber in one of the heads, and each set of tubes communicating with its respective chamber in the other head, one of the latter chambers being in communication with the annular space between the inner and outer casings and between the tube-sheets of the heater, and the other being in communication with the supply or discharge branch, substantially as specified.

3. The combination in a feed-water heater, of an outer casing having chambered heads, an inner casing containing a chamber with inlet and outlet, tube-sheets closing the opposite ends of said casing, and separating the same from the heads of the outer casing, tubes connecting said tube-sheets, a helical partition whereby the annular chamber between the inner and outer casings is formed into a spiral passage, and communication between said passage and one of the chambered heads of the outer casing, substantially as specified.

4. The combination in a feed-water heater, of inner and outer casings, with a helical partition forming the annular chamber between said casings into a spiral passage, said partition consisting of an angular bar having one of its flanges secured to one of the casings, the other flange forming the partition, substantially as specified.

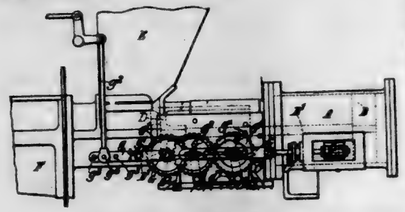
5. The combination in a feed-water heater, of inner and outer casings, with a helical partition forming the annular chamber between said casings into a spiral passage, said partition consisting of an angular bar having one of its flanges secured to the inner casing, substantially as specified.

6. The combination of a feed-water heater having steam and water passages therein, and a water-distributer located in the contracted steam-outlet branch whereby it provides for a condensation of the steam independently of that effected by contact of said steam with the casings of the passages through which the water flows, substantially as specified.

704,880. MECHANICAL STOKER. GEOFFREY HOWARD and GEO. GUNN, Bedford, England. Filed Jan. 18, 1902. Serial No. 90,266. (No model.)

Claim.—1. In a mechanical stoker, the combination with a fuel-

pressure cylinder, a ram worked thereby for supplying to the furnace the charges of fuel, and a valve for controlling the passage of the pressure fluid to and from said cylinder; of a cam-wheel for actuating the valve, and of means for imparting a step-by-step motion to said cam-wheel substantially as and for the purpose specified.



2. In a mechanical stoker, the combination with the fluid-pressure cylinder, the ram and the valve; of a cam-wheel for actuating the valve, of a pawl-and-ratchet device for imparting motion to said cam-wheel, of mechanical means for driving the pawl-and-ratchet device, and of means for imparting additional motion to said cam-wheel independently of the said pawl-and-ratchet device, substantially as and for the purpose specified.

3. In a mechanical stoker, the combination with the fluid-pressure cylinder, the ram and the valve; of a cam-wheel for actuating the valve, of a pawl-and-ratchet device for imparting motion to the cam-wheel, of mechanical means for driving the pawl-and-ratchet device, of an arm on the ram, of a movable bar provided with abutments lying in the path of said arm so as to be operated thereby as the said ram terminates its forward and rearward strokes for the purpose of actuating said movable bar, and of means whereby the movements of said bar are transmitted to said cam-wheel substantially as and for the purpose specified.

4. In a mechanical stoker, the combination with the fluid-pressure cylinder, the ram and the valve; of a cam-wheel for actuating the valve, of a pawl-and-ratchet device for imparting motion to the cam-wheel, of mechanical means for driving the pawl-and-ratchet device, of an arm on the ram, of a movable bar provided with adjustable abutments lying in the path of said arm so as to be operated thereby as said ram terminates its forward and rearward strokes for the purpose of actuating said movable bar, and of pawls connected with said movable bar and adapted to impart the movements of said bar to said cam-wheel substantially as and for the purpose specified.

5. In a mechanical stoker, the combination with the fluid-pressure cylinder, the ram and the valve; of a cam-wheel for actuating the valve, of a pawl-and-ratchet device for imparting motion to the cam-wheel, of mechanical means for driving the pawl-and-ratchet device, of an arm on the ram, of a rocking bar provided with adjustable abutments having inclined surfaces lying in the path of said arm so as to be operated thereby as said ram terminates its forward and rearward strokes for the purpose of actuating said rocking bar, and of two pawls carried by the rocking bar and engaging with the ratchet of the cam-wheel in opposite directions for imparting thereto the rocking movements of said bar substantially as and for the purpose specified.

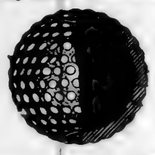
6. In a mechanical stoker, the combination with the fluid-pressure cylinder, the ram and the valve; of a cam-wheel, a sliding bar connected with the valve, a projection on said sliding bar engaging with the cam-slot of said cam-wheel, a pawl-and-ratchet device for imparting motion to the cam-wheel, mechanical means for driving the pawl-and-ratchet device, an arm on the ram, a rocking bar provided with adjustable abutments having inclined surfaces lying in the path of the said arm so as to be operated thereby as said ram terminates its forward and rearward strokes for the purpose of actuating said rocking bar, and two pawls carried by the rocking bar and engaging with the ratchet of the cam-wheel in opposite directions for imparting thereto the rocking movements of said bar substantially as and for the purpose specified.

7. In a mechanical stoker, the combination with the fluid-pressure cylinder the ram and the valve; of a cam-wheel for actuating the valve, of a pawl-and-ratchet device for imparting motion to said cam-wheel, of an oscillatory arm carrying the pawl of said ratchet device, of mechanical means for oscillating said arm, and of means for varying the amplitude of the oscillations of said arm for the purpose specified.

8. In a mechanical stoker, the combination with the fluid-pressure cylinder the ram and the valve; of a cam-wheel for actuating the valve, of a pawl-and-ratchet device for imparting motion to said cam-wheel, of an oscillatory arm carrying the pawl of said ratchet device, of a lever pivoted to said oscillatory arm, of a stop-piece adapted to lie in the path of the free end of said lever, and of means for actuating said lever and, through it, the oscillatory arm substantially as and for the purpose specified.

9. In a mechanical stoker, the combination with the fluid-pressure cylinder the ram and the valve; of a cam-wheel for actuating the valve, of a pawl-and-ratchet device for imparting motion to said cam-wheel, of an oscillatory arm carrying the pawl of said ratchet device, of a bent lever pivoted to said oscillatory arm, of an adjustable stop adapted to lie in the path of the free end of said bent lever, of a crank-plate connected by a rod with the opposite end of said bent lever, and of a fluid-pressure motor for driving said crank-plate through suitable gearing substantially as and for the purpose specified.

704,881. PLAYING-BALL. ELEAZER KEMPSHALL, Boston, Mass., assignor to The Kempshall Manufacturing Company, a Corporation of New Jersey. Filed May 13, 1898. Serial No. 107,019. (No model.)



Claim.—1. A playing-ball comprising a yielding center piece, a series of independent, endless, broad, thin rubber bands independently tensioned thereon and forming a larger sphere, and a shell of plastic material upon said sphere.

2. A playing-ball comprising a yielding center piece, a series of independent, endless, broad, thin rubber bands independently tensioned thereon and forming a larger sphere, and a shell of plastic material holding said sphere under compression.

3. A playing-ball comprising a sphere of solid rubber; a succession of independent, endless, broad rubber bands independently tensioned thereon and forming a larger sphere; and a shell of plastic material upon said sphere.

4. A playing-ball comprising a sphere of solid rubber, a succession of independent, endless, broad bands of softer rubber independently tensioned thereon and forming a larger sphere, and a shell of plastic material upon said sphere.

704,882. PLAYING-BALL. ELEAZER KEMPSHALL, Boston, Mass. Filed May 13, 1902. Serial No. 107,018. (No model.)

Claim.—1. A playing-ball comprising a hard core; a soft-rubber layer thereon; said layer being inclosed by a hard shell of such thinness as to be highly resilient; and a layer of soft rubber covering said shell.

2. A playing-ball comprising a hard core; a soft-rubber layer thereon; a hard thin shell inclosing said layer and provided throughout with perforations; and a layer of soft rubber covering said shell.

3. A playing-ball comprising a celluloid shell provided throughout with perforations, a thin layer of soft rubber covering said shell, and a cover of wear-resisting material upon said rubber layer and close to said celluloid shell.

4. A playing-ball comprising a hard thin shell provided throughout with perforations, a springy core reinforcing said shell, a thin layer of soft rubber covering said shell, and a casing of plastic material holding said rubber layer under compression.

5. A playing-ball comprising a celluloid shell, a layer of soft rubber covering said shell, the latter being provided throughout with perforations, and a shell of celluloid upon said rubber layer.

6. A playing-ball comprising a thin perforated hard shell; a sphere of hard springy material within said shell; a layer of soft material between said sphere and said shell; and a layer or facing of springy material upon said shell.

7. A playing-ball comprising a hard thin shell lined with soft rubber and provided throughout with perforations; a hard center piece filling said lined shell; soft rubber forming a thin outer covering upon said shell; and a shell of plastic material holding said soft-rubber covering under compression.

8. A playing-ball comprising a hard flexible shell; a filling for said hard shell consisting of a sphere of hard material inclosed in soft rubber; a layer of soft rubber covering said shell; and a casing of plastic material holding said rubber covering under compression.

9. A playing-ball comprising a hard core; a soft-rubber layer thereon; a hard perforated shell upon said layer; a soft-rubber facing upon said shell; and a casing of plastic material upon said soft-rubber facing.

10. A playing-ball comprising a hard core; a soft-rubber layer thereon; a perforated celluloid shell upon said layer; a soft-rubber facing upon said shell; and a casing of plastic material holding said rubber facing under compression.

704,883. CLAW-BAR. WILLIAM W. KEYLER and EDWARD BRITTON, North Lawrence, Ohio. Filed Oct. 1, 1901. Serial No. 77,219. (No model.)

Claim.—1. A claw-bar, comprising a fulcrum-block, a claw pivotally connected thereto, and an operating-lever pivotally connected to the claw and having an intermediate fulcrum engagement with the block above the pivotal connection between the claw and the lever.

2. A claw-bar, comprising a fulcrum-block, a claw pivotally connected thereto by means which permit of the longitudinal extension of the claw therefrom, and an operating-lever pivotally connected to the claw and adapted to have an intermediate fulcrum engagement with the block.

3. A claw-bar, comprising a fulcrum-block, a claw having an endwise-slidable and pivotal connection with the block, and an operating-lever pivotally connected to the forward portion of the claw and having its intermediate portion constructed to bear against the block as a fulcrum-support.

4. A claw-bar, comprising a fulcrum-block, a slotted claw, a pivot-pin piercing the block and the slotted portion of the claw, and an operating-lever pivotally connected to the claw and having its intermediate portion constructed to have a fulcrum-bearing upon the block.

5. A claw-bar, comprising a fulcrum-block having opposite upstanding bearing-ears, a claw having a longitudinal-slotted shank portion received between the ears, a pivot-pin piercing the ears and passing through the slot of the shank, and a forked operating-lever straddling the claw and pivotally connected thereto, the intermediate portion of the lever being constructed to have a fulcrum-bearing upon the ears of the block.

6. A claw-bar, comprising a fulcrum-block, a claw, an operating-lever, and connecting means between these parts to shift the initial fulcrum-bearing of the lever upon the block to the connection between the claw and the block.

7. A claw-bar, comprising a fulcrum-block, a claw pivotally connected thereto, and an operating-lever having its lower end pivotally connected to the claw below the pivotal connection between the claw and the fulcrum-block, the latter having a portion rising above the pivotal connection between the claw and the lever and located in the path of the rearward movement of the lever to form a fulcrum-bearing thereof.

8. A claw-bar, comprising a fulcrum-block, a claw pivotally and adjustably connected thereto, and an operating-lever pivotally connected to the claw between the operative end of the latter and its pivotal connection with the block.

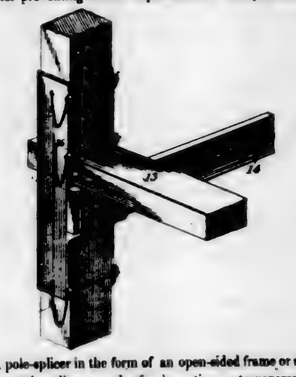
704,884. SCAFFOLD-SPLICER. JOHN LALLY, Waltham, Mass. Filed Nov. 25, 1901. Serial No. 83,636. (No model.)

Claim.—1. A scaffold-splicer in the form of an open-sided sleeve or frame adapted to embrace the adjacent ends of pole-sections, and retaining-pins removably inserted through eyes at the open side of the sleeve and adapted to form abutments for the adjacent sides of the pole-sections.

2. A pole-splicer in the form of an open-sided sleeve or frame adapted to receive the adjacent ends of pole-sections, a partition or shelf arranged intermediate the ends of the sleeve and forming an abutment for the extremities of the pole-sections, and detachable retaining-pins extending across the open side of said sleeve or frame.

3. A pole-splicer in the form of an open-sided sleeve or frame adapted to embrace the adjacent ends of pole-sections, a partition or shelf arranged intermediate the ends of the splicer and forming an abutment for the extremities of the pole-sections, detachable retaining-pins extending across the open side of the splicer at or near the opposite ends thereof, and an intermediate retaining-pin extending across the open side of the splicer and arranged to project above and below the partition so as to engage the extremities of the pole-sections.

4. A scaffold-splicer in the form of an open-sided frame provided intermediate its ends with a transverse partition and provided with a pair of log-opening extending through the rear wall thereof at one side of the partition, and detachable retaining-pins extending across the open side of the splicer for preventing lateral displacement of the pole-sections.



5. A pole-splicer in the form of an open-sided frame or sleeve adapted to embrace the adjacent ends of pole-sections, a transverse partition located intermediate the ends of the splicer and forming an abutment for the extremities of the pole-sections, detachable retaining-pins extending across the open side of the splicer, and a ledger-holder in the form of a hook located to one side of the plane of the partition.

6. A scaffold-splicer in the form of an open-sided frame or sleeve, a transverse partition located intermediate the ends of the splicer, detachable retaining-pins crossing the open side of the splicer at or near its opposite ends, and a ledger-holder extending across the open side of the splicer and forming an abutment for one of the pole-sections.

704,885. COMBINED MUD-GUARD, SUPPLEMENTAL SEAT, AND PARCEL-HOLDER FOR BICYCLES. HENRY M. LAMBERT and OREN H. JOY, Portland, Oreg. Filed July 12, 1901. Serial No. 68,073. (No model.)

Claim.—1. A bicycle attachment, comprising a combined seat and guard portion; two opposing members pivotally mounted on said seat and guard portion, said opposing members having clips to engage the diverging back bars of a bicycle-frame, and bracket members connected at their lower ends to said opposing members, and extending upwardly and rearwardly to loosely engage the seat and guard portion, as specified and for the purposes described.

2. A bicycle attachment, comprising a combined seat and guard member, adapted to be supported in a horizontal position over the rear wheel of a bicycle and two opposing brace members loosely connected at one end to the rear portion of said seat member and bent upwardly at their free ends, and formed into clips adapted to engage the diverging back bars of a bicycle-frame, and means carried by said upwardly-bent portions for also engaging the front end of the seat member, as set forth.

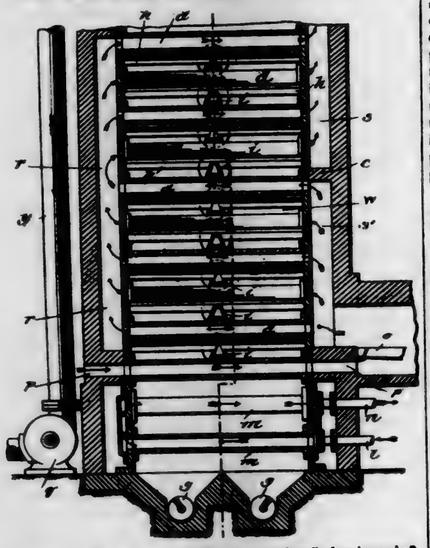
3. A bicycle attachment, comprising a combined seat and guard portion; two opposing and downwardly-extending members pivotally mounted at the front end of said seat portion, said members having clips to engage the diverging back bars of a bicycle-frame; and opposing brace members connecting the lower ends of the pivoted members with the rear end of the seat portion, for the purposes specified.

4. A bicycle attachment, comprising a luggage-carrying portion, a pair of opposing back-bar-gripping members, loosely connected to the said luggage-carrying portion, said gripping members having means at the upper and lower ends for clamping the back bars of the bicycle, and having their lower ends bent to form brackets to engage the luggage-carrying portion, for the purposes specified.

5. As an attachment for bicycles for the purposes described, comprising a seat-board, a bracket member on the under side, said member having a straight front plate, and clamp members pivotally secured to the outer face of said plate, whereby their lower ends will open laterally, said members having portions to grip the rear forks of a bicycle-frame, as set forth.

6. As a new article, a combined child's seat, luggage-carrier, and mud-guard for bicycles, comprising, in combination, a bracket 4, having a straight front face *b*, the upper end of which is bent back to form a flange *a*, its lower end bifurcated and terminating in rearwardly and upwardly extending arms *c*, the board 5, detachably secured upon the flange *a* and arms *c*, and the members 8, pivotally secured on the front face *b* of the bracket 4, each having inwardly-bent clamp members 8^a 8^a, on the front face to engage the rear fork bars of a bicycle, and inwardly-extending guide-flanges 8^b, on the rear face to close over the front face *b*, of the bracket 4, all being arranged substantially as shown and for the purposes described.

704,886. APPARATUS FOR DRYING AND DISTILLING WOOD, SAWDUST, PEAT, OR THE LIKE, AND FOR TREATING OTHER SUBSTANCES. EDUARD LARSEN, Copenhagen, Denmark. Filed Apr. 1, 1901. Serial No. 53,899. (No model.)



Claim.—1. In an apparatus of the character described, an inner shaft, an outer shaft surrounding said inner shaft, a drying-chamber arranged in the upper portion of said inner shaft, a distilling-chamber arranged in the lower portion of said inner shaft, a port-chamber interposed between said drying and distilling chambers, means for establishing communication between said port-chamber and said drying-chamber, and means for establishing communication between said distilling-chamber and said port-chamber, substantially as herein shown and described and for the purpose set forth.

2. In an apparatus of the character described, an outer shaft, an inner shaft arranged within said outer shaft, and of such size as to form on the two opposite sides thereof flues between the two shafts, partitions in the said flues, a drying-chamber in the upper portion of said inner flue, a distilling-chamber in the lower portion of said inner flue, and a port-chamber interposed between said drying and distilling chamber.

3. In an apparatus of the character described, an outer shaft, an inner shaft arranged within said outer shaft, and of such size as to form on the two opposite sides thereof flues between the two shafts, partitions in the said flues, a drying-chamber in the upper portion of said inner flue, a distilling-chamber in the lower portion of said inner flue, a port-chamber interposed between said drying and distilling chamber, means for establishing communication between said port-chamber and drying-chamber, and means for establishing communication between said distilling-chamber and said port-chamber.

4. In an apparatus of the character described, an outer shaft, an inner shaft arranged within said outer shaft, and of such size as to form on the two opposite sides thereof flues between the two shafts, a drying-chamber arranged in the upper portion of said inner shaft, a series of heating-flues in said drying-chamber and communicating with the flues at the opposite side of the inner shaft, a distilling-chamber in the lower portion of said inner shaft, a series of heating-pipes arranged in said distilling-chamber and communicating with the flues at the two opposite sides of said inner shaft, and an exhausting device in communication with said drying-chamber.

5. In an apparatus of the character described, an outer shaft, an inner shaft arranged within said outer shaft, and of such size as to form on the two opposite sides thereof flues between the two shafts, a drying-chamber arranged in the upper portion of said inner shaft, a series of heating-flues in said drying-chamber and communicating with the flues at the opposite side of the inner shaft, a distilling-chamber in the lower portion of said inner shaft, a series of heating-pipes arranged in said distilling-chamber and communicating with the flues at the two opposite sides of said inner shaft, an exhausting device in communication with said drying-chamber, a port-chamber interposed between said drying and distilling chambers, means for establishing communication between said port-chamber and said drying-chamber, and means for establishing communication between said port-chamber and said distilling-chamber.

6. In an apparatus of the class described, an inner and outer shaft arranged to form flues at two opposite sides of said inner shaft, a drying-chamber arranged in the upper portion of said inner shaft, a distilling-chamber in the lower portion of said inner shaft, a port-chamber interposed between the said drying and distilling chambers, separate means for establishing communication between said port-chamber and said drying and distilling chambers, a series of triangular-shaped heating-flues extending through said drying-chamber and communicating with flues at two opposite sides of said inner shaft, a series of heating-pipes arranged in said distilling-chamber and communicating with said flues at two opposite sides of said inner shaft, channels arranged below said heating-pipes, and a collecting-pipe in communication with the said channels.

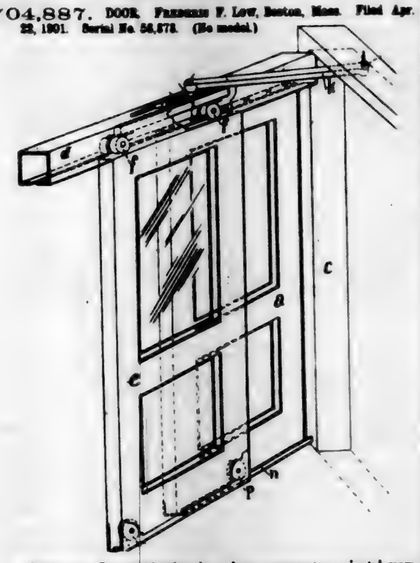
7. In an apparatus for continuously drying and distilling wood, sawdust, peat and the like, an outer and inner shaft arranged to form flues at two opposite sides of said inner shaft, a drying-chamber arranged in the upper portion of said inner shaft and communicating with said flues, a distilling-chamber in the lower portion of said inner shaft, a series of heating-pipes arranged in said distilling-chamber, channels mounted below said heating-pipes, a collecting-pipe in suitable communication with said channels, a cooling means mounted in the lower portion of said distilling-chamber, and means at the lower portion of said distilling-chamber for conveying the material therefrom.

8. In an apparatus for continuously drying and distilling wood, sawdust, peat and the like, the combination of a rectangular upright shaft constructed of masonry or the like, a metallic shaft arranged in said upright shaft and forming flues at two opposite sides thereof between the two shafts, a drying-chamber on the upper portion of said metallic shaft suitably communicating with said flues, a port-chamber below the said drying-chamber and adapted to communicate therewith, a distilling-chamber below the said port-chamber and adapted to communicate therewith, a series of heating-pipes in said distilling-chamber, means for cooling the treated material arranged within said distilling-chamber, and means for conveying the treated material from said distilling-chamber arranged at the lower portion of the latter.

9. In an apparatus for continuously drying and distilling wood, sawdust, peat and the like, a substantially rectangular upright shaft constructed of masonry or the like, an iron shaft arranged within said upright shaft and forming flues at two opposite sides thereof between the shafts, partitions suitably arranged in the said flues, a drying-chamber in the upper portion of said iron shaft, a distilling-chamber at the lower portion of said iron shaft, a port-chamber interposed between the said drying and distilling chambers, a distilling means for establishing communication between said port and said drying chambers, means for establishing communication between said port and distilling chambers, a series of triangular shaped heating-flues arranged within said drying-chamber and communicating with the flues at two opposite sides of said iron shaft, a series of heating-pipes, mounted in said distilling-chamber and communicating with the flues at two opposite sides of said iron shaft, channels arranged below said heating-pipes, collecting-pipes suitably connected to said channels, means for cooling the material arranged in said distilling-chamber, means for conveying the material from said distilling-chamber, and exhausting means in communication with one of said flues at the side of the iron shaft.

10. In an apparatus for continuously drying and distilling wood, sawdust, peat and the like, the combination of an upright shaft B, a shaft A within said shaft B and forming flues at two opposite sides thereof between the said shafts, a heating-chamber in the upper portion of said shaft A and communicating with said flues, a distilling-chamber at the lower portion of said shaft A, heating-pipes extending through said distilling-chamber and communicating with said flues at two opposite sides of said shaft A, means arranged in the said distilling-chamber for collecting the products of distillation, means arranged in said distilling-chamber for cooling the material treated, means for conveying the treated material from the said distilling-chamber, a port-chamber arranged between said drying and distilling chamber, separate means for establishing communication between the said port-chamber and said drying and distilling chambers, and an exhausting device in communication with one of the flues at the sides of the said shaft A.

704,887. DOOR. FREDERIK F. LOW, Boston, Mass. Filed Apr. 22, 1901. Serial No. 56,678. (No model.)



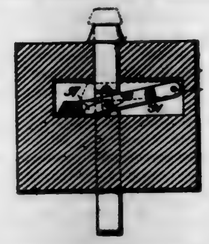
Claim.—1. In combination in a door, a support; a pivotal member; a slidable member; a pair of counting racks, one for said pivotal member and the other for said slidable member; and a toothed mechanism which engages and travels over one of said racks and communicates rectilinear motion to the other of said racks.

2. In combination in a door, a support; a pivotal member; a slidable member; a pair of counting racks, one for said pivotal member and the other for said slidable member; and a pinion which is mounted to swing about said support and which intermeshes with said racks.

3. In combination in a structure of the class described, a fixed support; a swinging support formed with a rack; a slidable rack; an arm pivoted on said fixed support; and a pinion carried by the free end of said arm, said pinion meshing with said racks.

4. In combination in a structure of the class described, a rotatable member formed with a rack; a support for said rotatable member; a slidable member formed with a rack; a pinion in mesh with said racks; and an arm pivoted in said support and carrying said pinion at its free end.

704,888. CAR-COUPLING. HENRY H. MARSHALL, Lincoln, Nebr. Filed Feb. 23, 1902. Serial No. 95,753. (No model.)



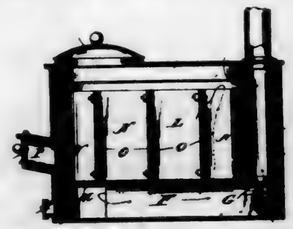
Claim.—1. The combination of a draw-head, a pivoted knuckle, a vertically-movable pin, a transversely-disposed block pivotally connected with the pin and arranged to swing upward and downward and adapted to engage the arm of the knuckle, and a pivoted supporting device arranged to swing transversely of the draw-head and adapted to hold the block in an elevated position and arranged to be engaged by the arm of the knuckle, substantially as described.

2. The combination of a draw-head, a pivoted knuckle, a vertically-movable pin, a transversely-disposed block arranged to swing upward and downward and adapted to engage the arm of the knuckle and provided with a slot, a supporting device adapted to hold the block in an elevated position and arranged to be engaged by the arm of the knuckle, and a pin pivoting the support in the slot of the block and connecting the latter to the vertically-movable pin, substantially as described.

3. The combination of a draw-head having a pivoted knuckle, a transverse block pivotally connected at one end with the draw-head and arranged to swing upward and downward and adapted to engage the arm of the knuckle, a support pivoted to the block and adapted to hold the latter in an elevated position and arranged to swing transversely of the draw-head and capable of swinging in either direction from a vertical position, and means for lifting the block, substantially as described.

4. The combination of a draw-head having a pivoted knuckle, a transversely-disposed locking-block engaging the knuckle and arranged to swing upward and downward, a vertically-movable pin connected with the block, and a supporting device pivoted to the block for holding the same in an elevated position, substantially as described.

704,889. HEATING-STOVE. CHARLES MATTHEWS, Columbia, Mo. Filed Apr. 14, 1902. Serial No. 102,743. (No model.)



Claim.—1. In a heating-stove of the character described, the combination with a smoke-passage involving an open-ended and fixed compartment, substantially as described, secured to and of less width than the bottom of the stove and thereby forming side passage-ways, as shown, and a vertical flue connecting the rear end of the said compartment and extending up through the top of the stove, of a fire-box formed by a detachable closed bottom, and side walls ending short of the length of the stove forming passage-ways on both sides of the said vertical flue, said passage-ways connecting the passage-ways along the bottom of the stove, substantially as described.

2. The combination in a heating-stove, of a fire-pot of length shorter than the interior of the body of the stove, downward smoke-passages on both sides of a vertical smoke-pipe within the body of the stove and communicating with horizontal passage-ways on both sides of a fixed compartment located between the bottom of the fire-pot and the bottom of the body or outer shell of the stove, open communication at the forward end of said fixed compartment with the horizontal side passage-ways, and open communication at the rear of said fixed compartment with the vertical pipe located at the rear of the stove and between the walls of the fire-pot and shell or body portion, substantially as described.

3. The combination in a heating-stove, of a fire-box formed of a series of sections having abutting and connected inturned edges and a closed bottom as shown, and smoke-passages at the rear of the stove connecting the fire-pot through suitable horizontal passage-ways extending from rear to front along the bottom of the stove with a vertical uptake or smoke-pipe within the walls of the body portion, substantially as described.

704,890. FEED-TABLE MECHANISM. THOMAS MORRISON, Braddock, Pa. Filed June 23, 1901. Serial No. 66,422. (No model.)

Claim.—1. A rolling-mill feed-table having a selector arranged to engage a single article in a group of articles and separate and move it laterally from the group of articles, and mechanism for moving the selector transversely of the table, substantially as described.

2. A feed-table having a transversely-movable carrier and a selector connected to the carrier and having a movable part arranged to engage a single article in a group of articles on the table and separate and move it laterally from the group of articles; substantially as described.

3. A feed-table having a transversely-movable carrier, a pusher on

the carrier and arranged to move an article to a group of articles on the table, and a movable selector arranged to engage a single article in the group of articles and separate and move it laterally from the group; substantially as described.

4. A feed-table having transversely-movable carriers, and pivoted selectors connected to the carriers and having notched portions arranged to automatically engage a single article in a group of articles on the table and separate and move it laterally from the group; substantially as described.

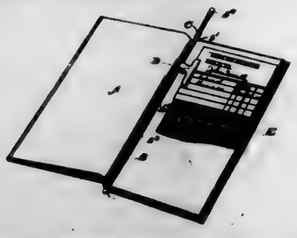
5. A feed-table having transversely-movable carriers, pivoted selectors mounted on the carriers, and mechanism for pressing the selectors yieldingly toward articles on the table, the selectors being arranged to engage a single article in a group of articles and separate and move it laterally from such group of articles; substantially as described.

6. A rolling-mill feed-table having a transversely-movable carrier, a selector mounted on the carrier and arranged to engage a single article in a group of articles lying on the table and separate and move it laterally from such group of articles, and trip mechanism arranged to automatically disengage the selector from the article after it is separated from the group; substantially as described.

7. A rolling-mill feed-table having transversely-movable selectors arranged to engage a single article in a group of articles on the table and separate and move it laterally from the group, and controllable mechanism for preventing the normal action of one of said selectors; substantially as described.

8. A rolling-mill feed-table having a transversely-movable carrier, a pivoted pusher-dog connected to the carrier and arranged to feed an article sidewise on the table and means for feeding metal longitudinally of the table, the dog being normally out of the line of feed and having an inclined face toward the entrance side, arranged to be contacted with by the article when the article being fed accidentally strikes said dog; substantially as described.

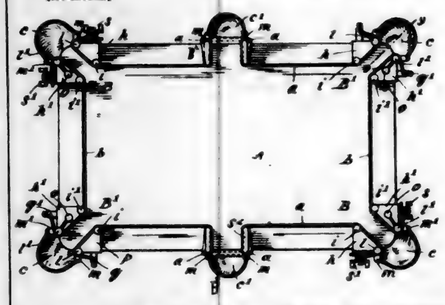
704,891. MANIFOLD DEVICE. EMIL LEUBER, Chicago, Ill. Filed Oct 14, 1901. Serial No. 78,633. (No model.)



Claim.—1. A slotted tubular guide-rod having a scale thereon, springs for holding said rod, one of which is rigidly secured to one end thereof and the other secured to a sleeve thereon and a spring-clip for holding paper, having a cylindrical head fitting in said tubular guide.

2. A copying-book, a slotted tubular guide, springs for holding said guide in place, a spring-clip having a cylindrical head slidably fitting in said guide, and having a rubber facing on the engaging edge of the upper jaw thereof, substantially as described.

704,892. POOL OR BILLIARD APPARATUS. THOMAS R. LOWERRE, New York, N. Y. Filed Nov. 22, 1901. Serial No. 83,232. (No model.)



Claim.—1. The combination with a plain table, of detachably-connected corner-brackets having pockets and grooved cord-retaining posts, cords to be stretched on said posts suitably for cushioning pool and billiard balls, and means for fastening and stretching said cords, said posts comprising a system whereon the cushioning-cords also define passages conducting the balls into lateral pockets.

2. The combination with a plain table, of detachably-connected corner-brackets having grooved cord-retaining posts, cords to be stretched on said posts suitably for cushioning pool and billiard balls, and means for fastening and stretching said cords, said posts comprising a system whereon the cushioning-cords also define passages conducting the balls into lateral pockets, and other posts whereon together with a part of the posts of said system the cords cut off said passages.

3. The combination with a plain table, of detachably-connected corner-brackets having grooved cord-retaining posts, cords to be stretched on said posts suitably for cushioning pool and billiard balls, and means for fastening and stretching said cords, the means for fastening the cords being on opposite brackets of one diagonal line of the table, and the means for stretching the cords being on the opposite brackets of the other diagonal line of said table, and consisting of a winding-spool and retaining-ratchet each, for one side cord and one end cord respectively.

4. The combination with a plain table, of detachably-connected corner-brackets having grooved cord-retaining posts, adapted for stretching cords thereon for cushioning pool-balls, said cords, means for fastening and stretching them, and pockets suspended from the brackets for the balls, said cords also adapted for directing the balls into the pockets.

5. The combination with a plain table, of detachably-connected corner-brackets and side brackets having grooved cord-retaining posts adapted for stretching cords thereon for cushioning pool-balls, said cords, means on the corner-brackets for fastening and stretching the cords, and pockets suspended from the brackets for the balls, said cords adapted for directing the balls into the pockets.

6. The combination with a plain table, of detachably-connected corner-brackets and side brackets having grooved retaining-posts adapted for stretching cords thereon for cushioning pool-balls, said cords, means on the corner-brackets for fastening and stretching the cords, and pockets suspended from the brackets for the balls, said cords adapted for directing the balls into the pockets, and the cords connected with the side brackets extended from one to the other of the retaining-posts of said brackets under the mouths of said pockets.

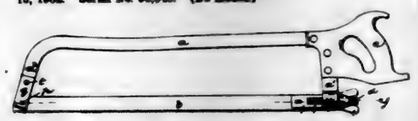
7. The combination with a plain table, of the diagonally-placed detachably-connected brackets B, each having the cord-supporting posts *i i'*, *l*, *l'*, and *o*, and the stretching and retaining spools and ratchets; the conversely diagonally placed brackets B' each having like cord-supporting posts *i i'* and *l l'*, the cord-fastening studs *q*, *q'* and the cords *a*, *b*.

8. The combination with a plain table, of the diagonally-placed detachably-connected brackets B, each having the cord-supporting posts *i*, *i'* and *l*, *l'*, and the stretching and retaining spools and ratchets; the conversely diagonally placed detachably-connected brackets B' each having like cord-supporting posts *i*, *i'*, and *l*, *l'*, and the cord-fastening studs *q*, *q'*, the cords *a*, *b*, the side brackets B^2 and the pockets suspended from the brackets.

9. The combination with a plain table, of the diagonally-placed detachably-connected brackets B, each having the cord-supporting posts *i*, *i'*, and *l*, *l'*, and the stretching and retaining spools and ratchet; the conversely diagonally placed detachably-connected brackets B' each having like cord-supporting posts *i*, *i'*, and *l*, *l'*, and the cord-fastening studs *q*, *q'*, the cords *a*, *b*, the side brackets B^2, and the pockets suspended from the brackets, said side brackets consisting of the part *d'*, arms A^2 A^3, posts s^2 and the outwardly-projecting studs q^2.

10. The combination with the cord and pocket supporting brackets adapted for detachable application to a plain table each of the pocket-rim-supporting lugs, pocket-rim therein, and the pocket supported by said rim and adapted for use in connection with said table as a pocket for pool or billiard balls.

704,893. SAW. ROBERT A. MARTIN, Newark, N. J. Filed Mar 13, 1902. Serial No. 98,063. (No model.)



Claim.—1. The improved saw comprising a frame having at one end arms between which the end of the saw-blade may enter and having an open slot and a plate pivoted to said frame, said plate having a tongue with inclined surface adapted to engage the said arms to draw the same against the saw-blade, a saw-blade having a hole to receive the said tongue, and means for holding said saw-blade in said frame under tension, substantially as set forth.

2. The improved saw, comprising a frame having at one end arms between which the end of the saw-blade may enter and having on the outer side of said frame an open slot, a pivotal plate at one side of said frame and having a tongue adapted to enter said open slot, said tongue being provided with an incline to engage one of said arms and clamp the saw-blade against the other to prevent lateral looseness of the said blade, and a screw in connection with said frame and the opposite end of said saw-blade to hold said saw-blade under tension, substantially as set forth.

3. In a saw, the combination with the frame having the arms a^4, a^5, and pivotal plate having a tongue with opposite inclines, adapted to engage said arms and draw the same against the saw-blade when said blade is fastened under tension in said frame, of said saw-blade arranged on said tongue between said arms, substantially as set forth.

4. In a saw, the combination with a frame having arms of a plate pivoted on said frame adjacent to said arms and provided with a saw-blade-holding tongue having opposite inclines engaging said arms, and a blade and means for maintaining the blade in a state of tension and the arms in a clamped relation to the said blade, substantially as set forth.

5. In a saw the combination with the frame having extensions to support the opposite ends of a saw-blade, the extension *a'*, of which is provided with a cylindrical, slotted head, of a bolt and nut, and clamping-plates carried by said bolt, one of said plates being pivotal and slidably related to the other of said plates and carrying a blade-holding tongue which is inclined to engage the other of said plates and clamp the saw-blade between the two when the saw is held under tension between the extensions of the frame, and a saw-blade perforated to receive the holding-tongue, substantially as set forth.

6. In a saw, the combination with the frame and a saw-blade, of a bolt carrying two saw-blade-clamping plates, one of said plates being slidably and laterally movable in relation to the other and having an inclined tongue adapted to hold the saw-blade and engage the other plate to effect a clamping of said plates against the blade when tension is brought to bear on said tongue, substantially as set forth.

7. In a saw, the combination with the frame and bolt and two clamping-plates slidably arranged on said bolt one in relation to the other, and one of said plates being provided with a tongue inclined where it engages the other of said plates, of a saw-blade arranged on said tongue between said plates and adapted to be clamped therebetween when the tension of the saw is brought to bear on said tongue, substantially as set forth.

704,894. WINDOW-SHADE SUPPORT. WILL K. MARTIN, Washington, D. C. Filed July 3, 1901. Serial No. 67,000. (No model.)

Claim.—1. In a window-shade support, the combination with a window-casing, of arms secured thereto, brackets movably supported thereby and adapted to support the ends of a curtain or shade pole, and means for moving said brackets longitudinally of said arms, substantially as described.

2. A window-shade support comprising in its construction parallel arms pivotally supported, curtain or shade pole carrying means movable thereupon and carried thereby, and means for moving the same, substantially as described.

3. In a window-shade support, the combination with a window-casing, of arms pivoted at their inner ends to the said casing, bossings secured to said arms, curtain or shade pole carrying means movable within said bossings, and means for moving the same, substantially as described.

4. In a window-shade support, the combination with a window-casing, of parallel arms pivoted thereto, bossings secured to and extending longitudinally of said arms, brackets, adapted to support the ends of curtain or shade poles, movably supported by said bossings, and means for moving said brackets longitudinally of said bossings, substantially as described.

5. In a window-shade support, the combination with a window-casing, of parallel arms secured to said casing, bossings extending longitudinally of said arms and provided each with a longitudinal slot, a slidable block within each of said bossings, a flange upon each of said blocks and extending through its respective slot, a bracket carried by said flange, and means for moving said blocks longitudinally of the bossings, substantially as described.

6. In a curtain or shade support, the combination with suitable uprights, of arms pivoted thereto, slotted bossings extending longitudinally of said arms, a slidable block carried within each of said bossings and extending through said slot, a bracket pivotally supported by said block, and an endless cable adapted to move said block longitudinally of its bossing, substantially as described.

7. In a curtain or shade support, the combination with suitable uprights, of arms carried thereby, a block slidably supported by each of said arms, each of said blocks having an eye at either end, a cable having its ends secured to the said eyes, one part of the said cable passing longitudinally of its said arm, having its end secured to one of the said eyes, and about a pulley at the outer end thereof, then passed back for a part of the length of said arm and about a second pulley, thence downward about a pulley carried by said upright, and upward again, about another pulley and longitudinally of said arm and its opposite end secured to the opposite eye, whereby an endless-cable effect is produced, and a bracket carried by each of said blocks and adapted to support the ends of a curtain or shade pole, substantially as described.

8. In a window-shade support, the combination with a window-casing, of parallel arms pivotally secured thereto and extending at a right angle therefrom, a slotted bossing extending longitudinally of each of said arms, slidable blocks within said bossings, flanges upon said blocks extending through said slots, curtain or shade pole carrying brackets carried by said flanges, eyes formed upon either end of each of said blocks, and a cable secured to one of said eyes at one end of each of the said blocks, passed longitudinally of each of said bossings within the same, about antifriction means at one end thereof, over suitable antifriction means carried by the sides of said window-casing, longitudinally into said bossings, and secured at the opposite end to the opposite eye of the said block, substantially as described.

9. A window curtain or shade support comprising pivotally-supported, parallel arms, brackets supported by said arms and slidable longitudinally thereof, means for sliding said brackets longitudinally of said arms, and a pole provided with axes having heads at their outer ends,

whereby said axes may be applied laterally upon said brackets and cannot be removed longitudinally, substantially as described.

10. In a curtain or shade support, the combination with suitable uprights, of arms extending therefrom, brackets supported thereby and movable longitudinal thereof and designed to support a curtain or shade pole and flexible means operable below said arms for moving said brackets, substantially as described.

11. A window curtain or shade support, comprising arms pivotally supported to swing in the same horizontal plane, a curtain or shade pole pivotally attached to said arms, and means for moving said pole to various angles relative to said arms, substantially as described.

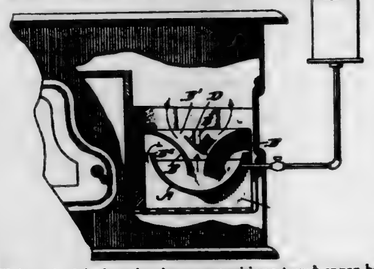
12. In a window curtain or shade support, the combination with a window-frame, of arms projecting at right angles thereto, curtain or shade pole carrying brackets movably supported thereby, and means for moving the same longitudinally of said arms, toward or from said window-frame, substantially as described.

13. In a curtain or shade support, the combination with suitable uprights, of pivotally-supported arms extending therefrom, in such manner that the same are adapted to be swung laterally in a horizontal plane, and brackets slidably mounted upon said arms for supporting a curtain or shade pole, substantially as described.

14. A curtain or shade support, comprising arms pivotally supported, a curtain or shade pole carried thereby, and means pivotally connecting the ends of said pole with said arms whereby the pole may assume a position at an acute angle to each of said arms, substantially as described.

15. A curtain or shade support, comprising arms pivotally supported, a curtain or shade pole carried thereby, in such manner as to be capable of assuming an acute angle with respect to each of said arms, and means for imparting a lateral movement to said pole, longitudinally of said arms, substantially as described.

704,895. HYDROCARBON-BURNER. HARRY C. MARTIN, Cincinnati, Ohio. Filed Aug. 3, 1901. Serial No. 70,811. (No model.)



Claim.—1. A hydrocarbon-burner comprising a trough or pan having supporting-feet at each end, the curved deflector-plates connected at their ends by means of strips adapted to rest upon the trough, and the pivoted damper supported upon the end strips, substantially as shown and described.

2. A hydrocarbon-burner comprising a trough or pan having end supports, the curved deflector-plates arranged centrally and longitudinally of the said trough or pan, the end strips to which the deflector-plates are connected, said end strips being cut away at their lower corners and slotted centrally at their upper edges, and a V-shaped damper having the ends of its shaft journaled in the said vertical slots, substantially as and for the purpose described.

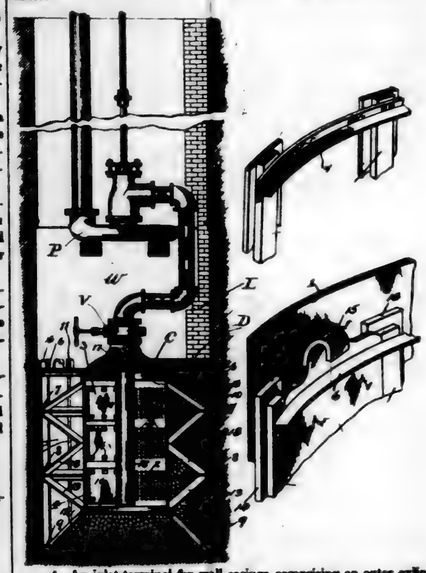
3. In a hydrocarbon-burner comprising a trough or pan, of curved deflector-plates arranged longitudinally of the said trough, the inner edges of said plates being arranged adjacent to each other and to the center of the trough, said plates being curved upwardly and outwardly away from each other and the strips connecting the ends of the plates and adapted to rest upon the sides of the trough, substantially as described.

704,896. WELL-INLET. DARBEY H. MAURY, Peoria, Ill. Filed May 13, 1901. Serial No. 60,067. (No model.)

Claim.—1. A well-inlet comprising an outer skeleton cylinder, removable sheeting temporarily closing said outer cylinder, a perforated inner cylinder, and means for temporarily closing the perforations in the inner cylinder.

2. A well-inlet comprising an outer skeleton cylinder, longitudinally-slidable sheeting temporarily closing said outer cylinder, a perforated inner cylinder, and means for temporarily closing the perforations in said inner cylinder.

3. A well-inlet comprising an outer skeleton cylinder, removable sheeting temporarily closing said outer cylinder, a perforated inner cylinder, means for temporarily closing the perforations in said inner cylinder, and an annular filter-bed packed between the inner and outer cylinders.



4. An inlet-terminal for well-casings comprising an outer cylinder, removable sheeting temporarily closing said outer cylinder, a perforated inner cylinder, means for temporarily closing the perforations in said inner cylinder, and a perforated bottom in said inner cylinder.

5. An inlet-terminal for well-casings comprising an outer skeleton cylinder, removable sheeting temporarily closing said outer cylinder, a perforated inner cylinder, means for temporarily closing the perforations in said inner cylinder, a perforated bottom in said inner cylinder, and a filter-bed packed around and beneath said inner cylinder.

6. The combination with a well-casing, of an inlet-terminal separated from the rest of the casing by a water-tight bulkhead, and comprising an apertured cylinder and a plurality of cover-plates removably bolted over the apertures in the cylinder on the interior thereof, and a suction-pipe leading from the cylinder up through the bulkhead.

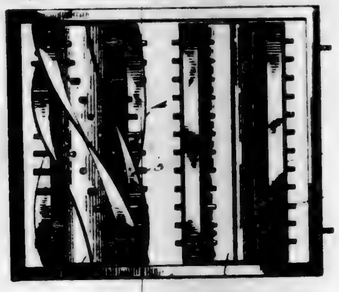
7. The combination with a well-casing and pump, of an inlet-terminal separated from the rest of the casing by a water-tight bulkhead and comprising an outer skeleton cylinder, removable sheeting temporarily closing said outer cylinder, a perforated inner cylinder, means for temporarily closing the perforations in the inner cylinder, and a suction-pipe leading to the pump from the inner cylinder.

8. The combination with a well-casing and pump, of an inlet-terminal separated from the rest of the casing by a water-tight bulkhead and comprising an outer skeleton cylinder, removable sheeting temporarily closing said outer cylinder, a perforated inner cylinder, means for temporarily closing the perforations in the inner cylinder, a suction-pipe leading to the pump from the inner cylinder, and a filter-bed packed around the inner cylinder.

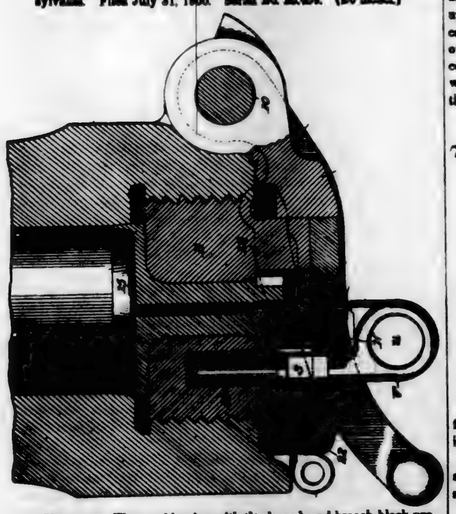
9. The combination with a well-casing and pump, of an inlet-terminal separated from the rest of the casing by a bulkhead and comprising an outer cylinder, removable sheeting temporarily closing said outer cylinder, a perforated inner cylinder, means for temporarily closing the perforations in the inner cylinder, a perforated bottom in said inner cylinder, a suction-pipe leading to the pump from the inner cylinder, and a filter-bed packed around and beneath the inner cylinder.

704,897. HARROW. EDGAR F. MAY, Washkomis, Okla. Filed Feb. 7, 1901. Serial No. 46,422. (No model.)

Claim.—A harrow comprising a carrying-frame, a front roller journaled in the frame and having a continuous rolling-surface, straight radial cutting-blades extending the length of the roller with spaces between them, straight rows of radial teeth disposed at intervals the length of the roller and between the cutting-blades, a rear roller journaled in the frame and having a continuous rolling-surface, cutting-blades spirally disposed on the face of the roller and extending longitudinally of the length thereof, and spirally-arranged rows of radially-extending teeth intermediate of the spirally-arranged cutting-blades.



704,898. BREECH MECHANISM. JOHN F. HINES, South Bethlehem, and SIGARD A. S. HAMMAR, Bethlehem, Pa., assignors to the Bethlehem Steel Company, South Bethlehem, Pa., a Corporation of Pennsylvania. Filed July 31, 1900. Serial No. 25,496. (No model.)



Claim.—1. The combination with the breech and breech-block provided with sectional threads or collars, of a frame carrying the breech-block and having a recess, a guide-rod extending along the recess, a rack-bar mounted to slide on the guide-rod, and a lever connected to operate the rack-bar, substantially as set forth.

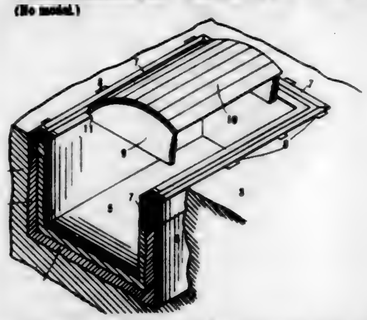
2. The combination with the breech-block and the primer-opening, of a hammer provided with a stem sliding in the breech-block and with a head, and swinging on its stem to and from said opening, substantially as set forth.

3. The combination with the breech-block and primer-opening, of a hammer provided with a stem sliding in the breech-block and with a head, and swinging on its stem to and from said opening, and a vent-cover and firing-pin carried thereby connected to swing with the hammer over and from the opening, substantially as set forth.

4. The combination with the breech-block and primer-opening, of a hammer provided with a stem sliding in the breech-block and with a head, and swinging to and from said opening, a vent-cover and firing-pin carried thereby connected to swing over and from the opening, an extractor, and means for operating the same on the movement of the vent-cover, substantially as set forth.

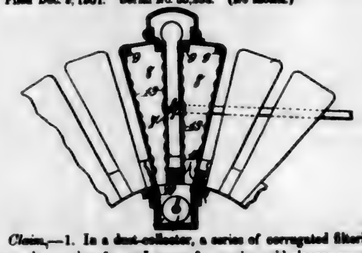
5. The combination with the breech-block and primer-opening, of a hammer provided with a stem sliding in the breech-block and with a head, and swinging to and from said opening, and means for mechanically swinging the hammer on its stem into and out of position on the turning of the breech-block, substantially as set forth.

704,899. BURIAL-VAULT AND METHOD OF CONSTRUCTING SAME. LEWIS MILLER, Thorntown, Ind., assignor of one-half to James T. McKim, Thorntown, Ind. Filed Jan. 22, 1902. Serial No. 90,787. (No model.)



Claim.—A method of constructing burial-vaults which consists in laying a floor of green cement upon the bottom of the grave, placing the casket-box thereon in the grave, inserting green cement between the vertical walls of the casket-box and the walls of the grave so as to form a unit with the cement floor, inserting removable absorbent strips in the upper edges of the vertical cement walls, inserting the casket in the casket-box, removing the absorbent strips, placing a supporting-covering over the open upper end of the casket-box, and placing a layer of green cement upon said covering and extending from side to side of the vertical walls so as to unite therewith and extend into the recesses formed by the removal of the absorbent strips.

704,900. DUST-COLLECTOR. JOHN R. MITCHELL, St. Louis, Mo. Filed Dec. 9, 1901. Serial No. 85,258. (No model.)



Claim.—1. In a dust-collector, a series of corrugated filtering-surfaces, a cleaner therefor, and means for moving said cleaner successively into contact with said surfaces.

2. In a dust-collector, a series of corrugated filtering-surfaces, a movable cleaner coöperating therewith, and means for moving said filtering-surfaces successively into the path of movement of said cleaner.

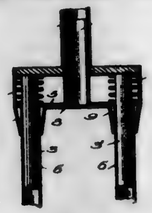
3. In a dust-collector, a series of corrugated filtering-surfaces, a cut-off chamber for successively cutting off said surfaces from access of dust-laden air, a cleaner for said filtering-surfaces, and means for moving said cleaner into contact with said filtering-surfaces as they are brought into communication with said cut-off chamber.

4. In a dust-collector, the combination with an intermittently-rotatable reel having a central drum therein into which dust-laden air is introduced, a cut-off chamber in said drum, and a rotary and bodily-movable cleaner, of a plurality of radially-arranged filtering-frames carried by said reel, each of said frames having the filtering-walls thereof provided with corrugated surfaces adapted to be engaged by said cleaner when said frames are in communication with said cut-off chamber.

5. In a dust-collector, the combination with an intermittently-rotatable reel having a central drum therein into which dust-laden air is introduced, and a cut-off chamber in said drum, of a series of radially-arranged filtering-frames carried by said reel, and communicating at their inner ends with the said drum, each of said frames having the filtering-walls thereof provided with auxiliary pockets, a plurality of said frames being adapted to be cut off from said drum by said cut-off chamber, and a cleaner acting upon the contiguous walls of two adjacent filtering-frames when the same are in communication with said cut-off chamber.

6. A filtering-frame for dust-collectors, comprising end pieces having corrugated side edges, strips connecting said end pieces, and a web of filtering-cloth passing around said strips and secured thereto and to the corrugated edges of said end pieces, as and for the purpose set forth.

704,901. BICYCLE. FERNANDO C. MOORE, San Bernardino, Cal. Filed Sept. 13, 1901. Serial No. 75,286. (No model.)

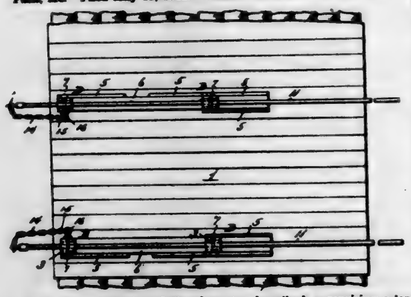


Claim.—A steering-fork, comprising a fork-crown, a tubular stem extending upward from the center thereof, studs pendent from the lower side of the crown, tubular fork-blades slidingly receiving said studs, a crown-plate serving as a yoke for the fork-blades, a tubular stub extending upward from the center of the crown-plate and slidingly fitting in the fork-stem, springs surrounding the pendent studs and interposed between the fork and fork-plate, and a jacket or casing connected with the fork-crown, and having a body portion, a bottom engaging the under side of the crown-plate whereby the upward movement of the studs within the fork-blades is limited, and pendent cuffs embracing the fork-blades.

704,902. MOISTURE-PROOF CIGAR-BOX. ALEXANDER MORTER, New York, N. Y. Filed Apr. 28, 1902. Serial No. 104,283. (No model.)

Claim.—A box for cigars and the like, comprising an outer lining of wood provided with a perforated bottom, a layer of fibrous material adjacent to said outer lining, and an inner lining of porous wood, said box being provided with a flat top consisting of upper and lower layers of porous wood between which is sandwiched a layer of fibrous material, the arrangement being such that the perforations of the bottom layer of the bottom of said box tend to compensate for the want of circulation of air through the bottom of the box due to the box resting upon an object.

704,903. MEANS FOR CHAINING LOGS. HUGH MCFADDEN, Rumford Falls, Me., assignor of one-half to Matthew McLeod, Rumford Falls, Me. Filed May 13, 1902. Serial No. 107,141. (No model.)



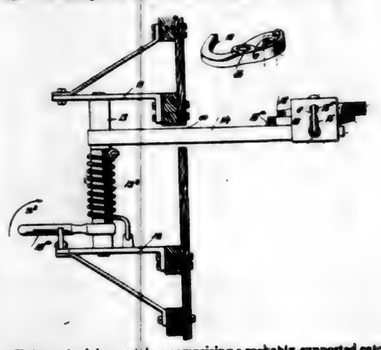
Claim.—1. A device of the character described, comprising a longitudinally-slidable rod, and a chain secured to the end of the rod and extensible by the movement of rod.

2. A device of the character described comprising suitable supports, a chain-carrying rod slidingly mounted in the supports, and a chain having one end detachably connected to the rod, and the other end detachably attached to a support.

3. A device of the character described, comprising a base, standards mounted on the base, upper and lower rollers journaled in the standards, a chain-carrying rod carried between the rollers, and a chain having one end detachably connected to the end of the rod and the other end detachably connected to one of the standards.

4. A device of the character described, comprising a supporting-base, pairs of standards secured in the base, rollers journaled in the standards, rods carried by the rollers, and chains having one end secured to the ends of the rods respectively, and the other ends secured to the standards.

704,904. MAIL-BAG CATCHER. CORWIN C. MCILVAR, Cambridge, Ohio. Filed Sept. 24, 1901. Serial No. 76,414. (No model.)



Claim.—1. A bag-catcher, comprising a rockably-supported catcher-arm, and catcher-jaws supported and pivoted so as to open and close on an end of the arm, each jaw having a buffer-limb and a hook member.

2. A bag-catcher, comprising a rockably-supported catcher-arm, a head-block on one end of the catcher-arm, two jaws held to rock on each other, each jaw having a buffer-limb and a hook member, and means to hold the hook members closed upon a mail-bag.

3. A bag-catcher, comprising a supported rock-shaft, spring-pressed to rock in one direction, a catcher-arm extended from the rock-shaft, a handle-lever on said shaft, a head-block on the free end of the catcher-arm, a slide-bar working through the head-block, two jaws held to rock on the head-block and adapted to slide the bar when they are rocked, each jaw comprising a buffer-limb and a hook member, and a device on the block and slide-bar adapted to detachably hold said bar retracted when moved by the jaws.

4. A bag catcher and deliverer, comprising a rockably-supported catcher-arm, a head-block on one end of the catcher-arm, a slide-bar having a forked end and occupying a longitudinal passage in the head-block, two lapped catcher-jaws pivoted on the head-block near one end and loosely connected with the fork-limbs of the slide-bar, each jaw consisting of a buffer-limb and a hook member, the hook members closing when the buffer-limbs are pressed apart, and a support for a mail-bag at the opposite end of the head-block, from which support said bag will be removed by pressure of the slide-bar thereon, effected when the hook members of the jaws grasp a bag.

5. In a device of the character described, a bracket-supported rock-shaft, a torsion-spring on said shaft adapted when under tension to rock the shaft in one direction, a handle-lever on the rock-shaft, a catcher-arm on the rock-shaft, a bag catcher and delivery device on the free end of said arm, and comprising catcher-jaws for a bag and a support for a bag to be delivered, a spring-controlled dog adapted to engage the handle-lever to hold the spring coiled under tension, and the catcher-arm outward, the said dog being arranged to be released by the impact of the mail-bag on the catcher-jaws, and means for moving the bag to be delivered from said support, the said means being also actuated by the impact of the mail-bag on the catcher-jaws.

6. In a mail-bag catcher, a supported rock-shaft, a spring on said shaft adapted to rock the shaft in one direction, means for rocking the shaft and holding the shaft rocked, a catcher-arm, a head-block, two lapped catcher-jaws pivoted on the head-block, a slide-bar forked at one end and loosely engaged at the ends of the fork-limbs with the members of the catcher-jaws, the rocking of the jaws to open and close them sliding the bar, a bent end on the slide-bar having an opening therein, a carrier-arm on the head-block adapted to receive and support a mail-bag, and a spring-pressed detent device for temporarily holding the bag engaged with the carrier-arm.

7. In a device of the character described, the pair of lapped and pivotally-supported catcher-jaws, each jaw consisting of a hollow hub, a convex-edged buffer-limb extended at one side of the hub, and a hook member curved laterally and forwardly from said hub at the opposite side from the buffer-limb.

8. In a device of the character described, the catcher device on a head-block, a rockably-supported catcher-arm, said arm having a journal-pin on one end whereon the head-block is held to rock.

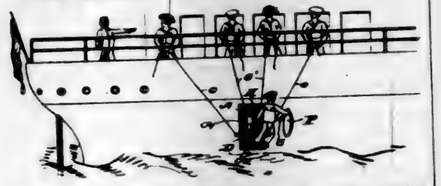
9. In a device of the character described, the combination with an arm supported to swing outward on a car, a torsion-spring tending to rock the arm inward, means for holding the arm in the outward position against the tension of the spring, and a mail-bag catcher and delivery device carried on the outer end of said arm, the said torsion-spring being arranged to permit the arm to move back under the force of the impact of the mail-bag, thereby releasing the holding means, and allowing the spring to move the arm inward.

10. In a device of the character described, a rockably-supported catcher-arm mounted to swing outward on a car, a mail-bag catcher and delivery device carried on the outer end of said arm and comprising catcher-jaws, a support for a bag to be delivered and a sliding device actuated by the movement of the catcher-jaws for moving the bag from said support when the catcher-jaws grasp a bag.

11. In a mail-bag catcher, a bracket-supported rock-shaft, a torsion-spring on said shaft, adapted to rock the shaft in one direction, a handle-lever on the rock-shaft, a dog adapted to engage the lever and hold the spring coiled under tension, a catcher-arm on the rock-shaft and a bag-catcher device on the free end of said arm and comprising catcher-jaws pivoted to open and close and each having a buffer-limb and a hook member.

12. In a device of the character described, the combination with an arm supported to swing outward on a car, a mail-bag catcher and delivery device carried on the outer end of said arm, and comprising a support for a mail-bag, pivoted catcher-jaws, a slide-bar connected with the catcher-jaws and adapted to move the bag from said support when the catcher-jaws grasp a bag, and a torsion-spring tending to swing the arm inward.

704,905. APPARATUS FOR REPAIRING VESSELS AT SEA. NEIL J. MCLAUGHLIN, Boston, Mass. Filed Feb. 20, 1902. Serial No. 94,963. (No model.)



Claim.—1. A device of the kind described, comprising a pad, a rope or cable passing through said pad provided with a locking-bar at one end, and a winding mechanism at the opposite end, said winding mechanism being arranged at the exterior of the pad, as set forth.

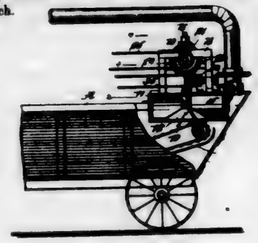
2. A device of the kind described, comprising a plate provided with a pad, a rope or cable passing through said plate and pad, a locking-bar attached to one end of said rope or cable, and a winding mechanism arranged upon the metallic plate for the purpose of winding the said rope or cable, substantially as described.

3. A device of the kind described, comprising a metallic plate, a pad arranged upon the inner side of said plate, a rope passing through the pad and plate, a bar attached to the inner end of said rope, a casing arranged upon the exterior of the plate, a drum arranged within the casing, the opposite end of the rope being connected to said drum, a hand-wheel connected with the said drum and arranged upon the top of the casing, a ratchet-wheel arranged within the casing and connected to the drum, and a spring-actuated pawl adapted to engage said ratchet and provided with means for disengaging it from the said ratchet, substantially as specified.

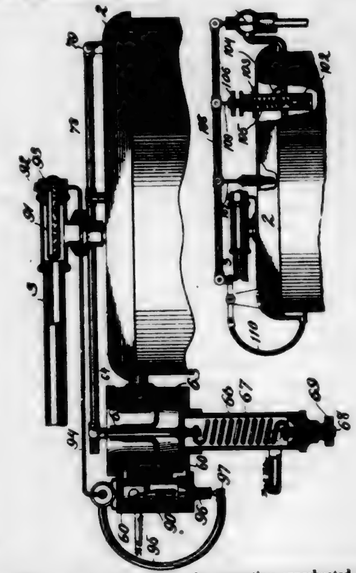
4. In a device of the kind described, the combination with the plate slotted vertically and having a casing arranged upon the exterior thereof, the interior face of said plate being padded, of a winding-drum arranged within the casing, and having a rope attached thereto, and a hand-wheel arranged upon the exterior of the casing, a ratchet-wheel arranged upon the interior of the casing and connected with the drum, a spring-actuated pawl and means for releasing the same, the horizontal shelf arranged upon the exterior of the plate and adjacent to its lower end, the flexible bail or handle and the suspending and guy ropes, all arranged and adapted to operate, substantially as described.

704,906. WIND-STACKER. WILLIAM H. MCWILLIAMS, Watonga, Okla. Filed June 24, 1901. Serial No. 65,845. (No model.)

Claim.—A wind-stacker for threshing-machines, comprising a conveyer for carrying mixed grain and straw, a fan for separating said grain from said straw, a vertical shaft for supporting said fan, a substantially cylindrical casing surrounding said fan, a revoluble member journaled upon said casing and provided with gear-wheels, a pair of gear-wheels mounted upon said casing and operatively connected with said revoluble member, said gear-wheels being disposed oppositely to each other and upon opposite sides of said shaft supporting said fan, a cylindrical stacking-tube, an annular bevel-gear rigidly secured thereto and meshing with one of the gear-wheels upon said revoluble member, a clutch, and a lever for actuating said clutch.



704,907. APPARATUS FOR GENERATING STEAM OR VAPOR. EDWARD C. NEWCOMB, Jamaica Plain, Mass., assignor of three-fifths to Philip Van Volkenburgh, New York, N. Y. Filed June 7, 1901. Serial No. 63,555. (No model.)



Claim.—1. In an apparatus for generating superheated steam or vapor, the combination with a combustion-chamber and a suitable generator arranged in coöperative relation with the same, of means for supplying a liquid to the generator, means for supplying a fuel to the combustion-chamber, and means for automatically varying the supplies of both the liquid and the fuel in substantial unison with the variations of demand for steam or vapor energy and in definite quantitative relations to said variations.

2. In an apparatus for generating superheated steam or vapor, the combination with a combustion-chamber and a suitable generator arranged in coöperative relation with the same, of means for supplying a liquid to the generator, means for supplying a fuel to the combustion-chamber, and means rendered operative by variations in the condition of the fluid being heated for automatically varying the supplies of both the liquid and the fuel in substantial unison with the variations of demand for steam or vapor energy and in definite quantitative relations to said variations of demand.

3. In an apparatus for generating superheated steam or vapor, the combination with a combustion-chamber and a suitable generator arranged in coöperative relation with the same, of means for supplying a liquid to the generator at a substantially predetermined pressure, means for supplying a fuel to the combustion-chamber, and means rendered operative

by variations in the condition as to pressure of the fluid being heated for automatically varying the supplies of both the liquid and the fuel in substantial unison with the variations of demand for steam or vapor energy and in definite quantitative relations to said variations of demand.

4. In an apparatus for generating superheated steam or vapor, the combination with a combustion-chamber and a suitable generator arranged in coöperative relation with the same, of means for supplying a liquid to the generator, means for supplying a fuel to the combustion-chamber, and means for automatically varying said supplies in such manner that the effective supplies of both the liquid and the fuel vary in substantial unison with the variations of demand for steam or vapor energy and in substantially definite quantitative relations to said variations.

5. In an apparatus for generating superheated steam or vapor, the combination with a combustion-chamber and a suitable generator arranged in coöperative relation with the same, of means for supplying a liquid to the generator, means for supplying a fuel to the combustion-chamber, and means rendered operative by variations in the condition of the fluid being heated, for automatically varying said supplies in such manner that the effective supplies of both the liquid and the fuel vary in substantial unison with the variations of demand for steam or vapor energy and in substantially definite quantitative relations to said variations.

6. In an apparatus for generating superheated steam or vapor, the combination with a combustion-chamber and a suitable generator arranged in coöperative relation with the same, of means for supplying a liquid to the generator at a substantially predetermined pressure, means for supplying a fuel to the combustion-chamber, and means rendered operative by variations in the condition as to pressure of the fluid being heated for automatically varying said supplies in such manner that the effective supplies of both the liquid and the fuel vary in substantial unison with the variations of demand for steam or vapor energy and in substantially definite quantitative relations to said variations of demand.

7. In an apparatus for generating superheated steam or vapor, the combination with a combustion-chamber and a suitable generator arranged in coöperative relation with the same, means for supplying a liquid to the generator, means for supplying a fuel to the combustion-chamber, and means for automatically varying the supplies of both the liquid and the fuel in substantial unison with the variations of demand for steam or vapor energy and in substantially the same degree with said variations.

8. In an apparatus for generating superheated steam or vapor, the combination with a combustion-chamber and a suitable generator arranged in coöperative relation with the same, means for supplying a liquid to the generator, means for supplying a fuel to the combustion-chamber, and means rendered operative by variations in the condition of the fluid being heated for automatically varying the supplies of both the liquid and the fuel in substantial unison with the variations of demand for steam or vapor energy and in substantially the same degree with said variations.

9. In an apparatus for generating superheated steam or vapor, the combination with a combustion-chamber and a suitable generator arranged in coöperative relation with the same, means for supplying a liquid to the generator at a substantially predetermined pressure, means for supplying a fuel to the combustion-chamber, and means rendered operative by variations in the condition as to pressure of the fluid being heated for varying the supplies of both the liquid and the fuel in substantial unison with the variations of demand for steam or vapor energy and in substantially the same degree with said variations of demand.

10. In an apparatus for generating superheated steam or vapor and delivering the same in a substantially unvarying condition as to the energy thereof, the combination with a combustion-chamber and a suitable generator arranged in coöperative relation with the same, means for supplying a liquid to the generator, means for supplying a fuel to the combustion-chamber, and means for automatically varying said supplies in such manner that the effective supplies of both the liquid and the fuel vary in substantial unison with the variations of demand for steam or vapor energy and in substantially definite quantitative relations to said variations of demand.

11. In an apparatus for generating superheated steam or vapor and delivering the same in a substantially unvarying condition as to the energy thereof, the combination with a combustion-chamber and a suitable generator arranged in coöperative relation with the same, means for supplying a liquid to the generator, means for supplying a fuel to the combustion-chamber, and means rendered operative by variations in the condition of the fluid being heated for automatically varying said supplies in such manner that the effective supplies of both the liquid and the fuel vary in substantial unison with the variations of demand for steam or vapor energy and in substantially the same degree with said variations.

12. In an apparatus for generating superheated steam or vapor and delivering the same in a substantially unvarying condition as to temperature and pressure, the combination with a combustion-chamber and a suitable generator arranged in coöperative relation with the same, means for supplying a liquid to the generator at a substantially predetermined pressure, means for supplying a fuel to the combustion-chamber, and means rendered operative by variations in the condition as to pressure of the fluid being heated for automatically varying said supplies in such manner that the effective supplies of both the liquid and the fuel vary in substantial unison with the variations of demand for steam or vapor energy and in substantially the same degree with said variations of demand.

13. In an apparatus for generating superheated steam or vapor, the combination with a combustion-chamber and a suitable generator arranged in coöperative relation with the same, of means for supplying a fuel to the combustion-chamber, means for supplying a liquid to the generator, said means being constructed to automatically vary the supply of the liquid in substantial unison with the variations of demand for steam or vapor energy and in a substantially definite quantitative relation to said variations, and means for maintaining a substantially predetermined quantitative relation between the supplies of the liquid and the fuel.

14. In an apparatus for generating superheated steam or vapor, the combination with a combustion-chamber and a suitable generator arranged in coöperative relation with the same, of means for supplying a fuel to the combustion-chamber, means for supplying a liquid to the generator, said means being rendered operative by variations in the condition of the fluid being heated to automatically vary the effective supply of the liquid in substantial unison with the variations of demand for steam or vapor energy and in a substantially definite quantitative relation to said variations of demand, and means for maintaining a substantially predetermined quantitative relation between the supplies of the liquid and the fuel.

15. In an apparatus for generating superheated steam or vapor, the combination with a combustion-chamber and a suitable generator arranged in coöperative relation with the same, of means for supplying fuel to the combustion-chamber, means for supplying a liquid to the generator at a substantially predetermined pressure, said means being rendered operative by variations in the condition as to pressure of the fluid being heated to automatically vary the effective supply of the liquid in substantial unison with the variations of demand for steam or vapor energy and in a substantially definite quantitative relation to said variations of demand, and means for maintaining a predetermined quantitative relation between the supplies of the liquid and the fuel.

16. In an apparatus for generating superheated-steam or vapor, the combination with a combustion-chamber and a suitable generator arranged in coöperative relation with the same, of means for supplying a fuel to the combustion-chamber, means for supplying a liquid to the generator, said means being constructed to automatically vary the supply of the liquid in substantial unison with the variations of demand for steam or vapor energy and in substantially the same degree with said variations, and means for maintaining a substantially predetermined quantitative relation between the supplies of the liquid and the fuel.

17. In an apparatus for generating superheated-steam or vapor, the combination with a combustion-chamber and a suitable generator arranged in coöperative relation with the same, of means for supplying a fuel to the combustion-chamber, means for supplying a liquid to the generator, said means being rendered operative by variations in the condition of the fluid being heated to automatically vary the effective supply of the liquid in substantial unison with the variations of demand for steam or vapor energy and in substantially the same degree with said variations of demand, and means for maintaining a substantially predetermined quantitative relation between the supplies of the liquid and the fuel.

18. In an apparatus for generating superheated steam or vapor, the combination with a combustion-chamber and a suitable generator arranged in coöperative relation with the same, of means for supplying a fuel to the combustion-chamber, means for supplying a liquid to the generator at a substantially predetermined pressure, said means being rendered operative by variations in the condition as to pressure of the fluid being heated to automatically vary the effective supply of the liquid in substantial unison with the variations of demand for steam or vapor energy and in substantially the same degree with said variations of demand, and means for maintaining a substantially predetermined quantitative relation between the supplies of the liquid and the fuel.

19. In an apparatus for generating superheated steam or vapor, the combination with a combustion-chamber and a suitable generator arranged in coöperative relation with the same, of means for supplying a fuel to the combustion-chamber, means for supplying a liquid to the generator, said means being constructed to automatically vary the supply of liquid in substantial unison with the variations of demand for steam or vapor energy and in a substantially definite quantitative relation to said variations, and means rendered operative by variations in the condition of the fluid being heated for maintaining a substantially predetermined quantitative relation between the supplies of the liquid and the fuel.

20. In an apparatus for generating superheated steam or vapor, the combination with a combustion-chamber and a suitable generator arranged in coöperative relation with the same, of means for supplying a fuel to the combustion-chamber, means for supplying a liquid to the generator, said means being constructed to automatically vary the supply of liquid in

substantial unison with the variations of demand for steam or vapor energy and in a substantially definite quantitative relation to said variations, and means rendered operative by variations in a condition of the fluid flowing through the generator resulting from variations in the flow of said fluid for maintaining a substantially predetermined quantitative relation between the supplies of the liquid and the fuel.

21. In an apparatus for generating superheated steam or vapor, the combination with a combustion-chamber and a suitable generator arranged in coöperative relation with the same, of means for supplying a fuel to the combustion-chamber, means for supplying a liquid to the generator, said means being constructed to automatically vary the supply of liquid in substantial unison with the variations of demand for steam or vapor energy and in a substantially definite quantitative relation to said variations and means rendered operative by variations in the condition as to pressure of the fluid being heated for maintaining a substantially predetermined quantitative relation between the supplies of the liquid and the fuel.

22. In an apparatus for generating superheated steam or vapor and delivering the same in a substantially unvarying condition as to the energy thereof, the combination with a combustion-chamber and a suitable generator arranged in coöperative relation with the same, of means for supplying a fuel to the combustion-chamber, means for supplying a liquid to the generator, said means being constructed to automatically vary the supply of the liquid in substantial unison with the variations of demand for steam or vapor energy and in substantially the same degree with said variations, and means for regulating the supply of the fuel in such manner that the effective supply of the fuel varies in substantial unison with the variations of supply of the liquid and in substantially the same degree with said variations of supply.

23. In an apparatus for generating superheated steam or vapor and delivering the same in a substantially unvarying condition as to the energy thereof, the combination with a combustion-chamber and a suitable generator arranged in coöperative relation with the same, of means for supplying a fuel to the combustion-chamber, means for supplying a liquid to the generator, said means being constructed to automatically vary the supply of the liquid in substantial unison with the variations of demand for steam or vapor energy and in substantially the same degree with said variations, and means rendered operative by variations in the condition of the fluid being heated for regulating the supply of the fuel in such manner that the effective supply of the fuel varies in substantial unison with the variations of supply of the liquid and in substantially the same degree with said variations of supply.

24. In an apparatus for generating superheated steam or vapor and delivering the same in a substantially unvarying condition as to the energy thereof, the combination with a combustion-chamber and a suitable generator arranged in coöperative relation with the same, of means for supplying a fuel to the combustion-chamber, means for supplying a liquid to the generator, said means being constructed to automatically vary the supply of the liquid in substantial unison with the variations of demand for steam or vapor energy and in substantially the same degree with said variations, and means rendered operative by variations in the condition of the fluid flowing through the generator resulting from variations in the flow of said fluid for regulating the supply of the fuel in such manner that the effective supply of the fuel varies in substantial unison with the variations of the flow of fluid through the generator and in substantially the same degree with said variations of flow.

25. In an apparatus for generating superheated steam or vapor and delivering the same in a substantially unvarying condition as to the energy thereof, the combination with a combustion-chamber and a suitable generator arranged in coöperative relation with the same, of means for supplying a fuel to the combustion-chamber, means for supplying a liquid to the generator, said means being constructed to automatically vary the supply of the liquid in substantial unison with the variations of demand for steam or vapor energy and in substantially the same degree with said variations, and means rendered operative by variations in the differential pressure resulting from variations in the flow of the fluid through the generator for regulating the supply of the fuel in such manner that the effective supply of the fuel varies in substantial unison with the variations of the flow of fluid through the generator and in substantially the same degree with said variations of flow.

26. In an apparatus for generating superheated steam or vapor and delivering the same in a substantially unvarying condition as to temperature and pressure, the combination with a combustion-chamber and a suitable generator arranged in coöperative relation with the same, of means for supplying a fuel to the combustion-chamber, means for supplying a liquid to the generator at a substantially predetermined pressure, said means being rendered operative by variations in the condition as to pressure of the fluid being heated for automatically varying the supply of the liquid in substantial unison with the variations of demand for steam or vapor energy and in substantially the same degree with said variations of demand, and means rendered operative by variations in the condition as to pressure of the fluid being heated for regulating the supply of the fuel in such manner that the effective supply of fuel varies in substantial unison with the variations of supply of the liquid and in substantially the same degree with said variations of supply.

27. In an apparatus for generating superheated steam or vapor and delivering the same in a substantially unvarying condition as to temperature and pressure, the combination with a combustion-chamber and a suitable generator arranged in coöperative relation with the same, of means for supplying a fuel to the combustion-chamber, means for supplying a liquid to the generator at a substantially predetermined pressure, said means being rendered operative by variations in the condition as to pressure of the fluid being heated to automatically vary the supply of the liquid in substantial unison with the variations of demand for steam or vapor energy and in substantially the same degree with said variations of demand, and means rendered operative by variations in a differential pressure resulting from variations in the flow of the fluid through the generator for regulating the supply of the fuel in such manner that the effective supply of the fuel varies in substantial unison with the variations of the flow of fluid through the generator and in substantially the same degree with said variations of flow.

28. In an apparatus for generating steam or vapor, the combination with a combustion-chamber and a suitable generator arranged in coöperative relation with the same, of means for supplying a fuel to the combustion-chamber, means for supplying a liquid to the generator, said means being constructed to automatically vary the supply of the liquid in substantial unison with the variations of demand for steam or vapor energy and in a substantially definite quantitative relation to said variations, means tending to maintain a substantially predetermined quantitative relation between the supplies of the liquid and the fuel, and means for varying the relation between said supplies.

29. In an apparatus for generating steam or vapor, the combination with a combustion-chamber and a suitable generator arranged in coöperative relation with the same, of means for supplying a fuel to the combustion-chamber, means for supplying a liquid to the generator, said means being constructed to automatically vary the supply of the liquid in substantial unison with the variations of demand for steam or vapor energy and in a substantially definite quantitative relation to said variations, and means rendered operative by variations in the condition of the fluid being heated for regulating the supply of the fuel in a manner tending to vary the supply of the fuel in substantial unison with the variations of supply of the liquid and according to a substantially predetermined quantitative relation to said variations of supply, and means for varying the relation between said supplies.

30. In an apparatus for generating steam or vapor and delivering the same at a substantially unvarying temperature, the combination with a combustion-chamber and a suitable generator arranged in coöperative relation with the same, of means for supplying a fuel to the combustion-chamber, means for supplying a liquid to the generator, said means being constructed to automatically vary the supply in substantial unison with the variations of demand for steam or vapor energy and in a substantially definite quantitative relation to said variations, means tending to maintain a substantially predetermined quantitative relation between the supplies of the liquid and the fuel, and means rendered operative by variations in the temperature of the steam or vapor for varying the relation between said supplies.

31. In an apparatus for generating steam or vapor and delivering the same at a substantially unvarying temperature, the combination with a combustion-chamber and a suitable generator arranged in coöperative relation with the same, of means for supplying a fuel to the combustion-chamber, means for supplying a liquid to the generator, said means being constructed to automatically vary the supply in substantial unison with the variations of demand for steam or vapor energy and in a substantially definite quantitative relation to said variations, and means rendered operative by variations in a condition of the fluid flowing through the generator resulting from variations in the flow for said fluid for maintaining a substantially predetermined quantitative relation between the supplies of the liquid and the fuel, and means rendered operative by variations in the temperature of the steam or vapor for varying the relation between said supplies.

32. In an apparatus for generating steam or vapor and delivering the same at a substantially unvarying temperature, the combination with a combustion-chamber and a suitable generator arranged in coöperative relation with the same, of means for supplying a fuel to the combustion chamber, means for supplying a liquid to the generator, said means being constructed to automatically vary the supply in substantial unison with the variations of demand for steam or vapor energy and in a substantially definite quantitative relation to said variations, means tending to maintain a substantially predetermined quantitative relation between the supplies of the liquid and the fuel, and means including a interated vapor-tension

thermostat operated by variations in the temperature of the steam or vapor for varying the relation between said supplies.

33. In an apparatus for generating steam or vapor and delivering the same at a substantially unvarying temperature, the combination with a combustion-chamber and a suitable generator arranged in coöperative relation with the same, of means for supplying a fuel to the combustion-chamber, means for supplying a liquid to the generator, said means being constructed to automatically vary the supply in substantial unison with the variations of demand for steam or vapor energy and in a substantially definite quantitative relation to said variations, and means rendered operative by variations in a condition of the fluid flowing through the generator resulting from variations in the flow of said fluid for maintaining a substantially predetermined quantitative relation between the supplies of the liquid and the fuel, and means including a saturated vapor-tension thermostat operated by variations in the temperature of the steam or vapor for varying the relation between said supplies.

34. In an apparatus for generating steam or vapor and delivering the same in a substantially unvarying condition as to temperature and pressure, the combination with a combustion-chamber and a suitable generator arranged in coöperative relation with the same, of means for supplying a fuel to the combustion-chamber, means for supplying a liquid to the generator at a substantially predetermined pressure, said means being rendered operative by variations in the condition as to pressure of the fluid being heated to automatically vary the effective supply of the liquid in substantial unison with the variations of demand for steam or vapor energy and in substantially the same degree with said variations of demand, means tending to maintain a substantially predetermined quantitative relation between the supplies of the liquid and the fuel, and means rendered operative by variations in the temperature of the steam or vapor for varying the relation between said supplies.

35. In an apparatus for generating steam or vapor and delivering the same in a substantially unvarying condition as to temperature and pressure, the combination with a combustion-chamber and a suitable generator arranged in coöperative relation with the same, of means for supplying a fuel to the combustion-chamber, means for supplying a liquid to the generator at a substantially predetermined pressure, said means being rendered operative by variations in the condition as to pressure of the fluid being heated to automatically vary the effective supply of the liquid in substantial unison with the variations of demand for steam or vapor energy and in substantially the same degree with said variations of demand, means tending to maintain a substantially predetermined quantitative relation between the supplies of the liquid and the fuel, and means including a saturated vapor-tension thermostat operated by variations in the temperature of the steam or vapor for varying the relation between said supplies.

36. In an apparatus for generating steam or vapor and delivering the same in a substantially unvarying condition as to temperature and pressure, the combination with a combustion-chamber and a suitable generator arranged in coöperative relation with the same, of means for supplying a fuel to the combustion-chamber, means for supplying a liquid to the generator at a substantially predetermined pressure, said means being rendered operative by variations in the condition as to pressure of the fluid being heated to automatically vary the effective supply of the liquid in substantial unison with the variations of demand for steam or vapor energy and in substantially the same degree with said variations of demand, means rendered operative by variations in a condition of the fluid flowing through the generator resulting from variations in the flow of said fluid for maintaining a substantially predetermined quantitative relation between the supplies of the liquid and the fuel, and means including a saturated vapor-tension thermostat operated by variations in the temperature of the steam or vapor for varying the relation between said supplies.

37. In an apparatus for generating steam or vapor and delivering the same in a substantially unvarying condition as to temperature and pressure, the combination with a combustion-chamber and a suitable generator arranged in coöperative relation with the same, of means for supplying a fuel to the combustion-chamber, means for supplying a liquid to the generator at a substantially predetermined pressure, said means being rendered operative by variations in the condition as to pressure of the fluid being heated to automatically vary the effective supply of the liquid in substantial unison with the variations of demand for steam or vapor energy and in substantially the same degree with said variations of demand, means rendered operative by variations in a condition of the fluid flowing through the generator resulting from variations in the flow of said fluid for maintaining a substantially predetermined quantitative relation between the supplies of the liquid and the fuel, and means including a saturated vapor-tension thermostat operated by variations in the temperature of the steam or vapor for varying the relation between said supplies.

38. In an apparatus for generating steam or vapor, the combination with a combustion-chamber and a generator arranged in coöperative relation with the same, of means for supplying a liquid to the generator, means for supplying a fuel to the combustion-chamber, and means for automatically varying the supplies of both the liquid and the fuel in substantial unison with the variations of demand for steam or vapor energy and in substantially definite quantitative relations to said variations, said generator being of a typein which only a small quantity of the liquid is maintained at the temperature of vaporization.

39. In an apparatus for generating steam or vapor, the combination with a combustion-chamber and a generator arranged in coöperative relation with the same, of means for supplying a liquid to the generator, means for supplying a fuel to the combustion-chamber, and means rendered operative by variations in the condition of the fluid being heated for automatically varying the supplies of both the liquid and the fuel in substantial unison with the variations of demand for steam or vapor energy and in substantially definite quantitative relations to said variations, said generator being of a type in which only a small quantity of the liquid is maintained at the temperature of vaporization.

40. In an apparatus for generating steam or vapor, the combination with a combustion-chamber and a generator arranged in coöperative relation with the same, of means for supplying a liquid to the generator, means for supplying a fuel to the combustion-chamber, and means for automatically varying the supplies of both the liquid and the fuel in substantial unison with the variations of demand for steam or vapor energy and in substantially the same degree with said variations, said generator being of a type in which only a small portion of the liquid is maintained at the temperature of vaporization.

41. In an apparatus for generating steam or vapor, the combination with a combustion-chamber and a generator arranged in coöperative relation with the same, of means for supplying a liquid to the generator, means for supplying a fuel to the combustion-chamber, and means rendered operative by variations in the condition of the fluid being heated for automatically varying the supplies of both the liquid and the fuel in substantial unison with the variations of demand for steam or vapor energy and in substantially the same degree with said variations, said generator being of a type in which only a small portion of the liquid is maintained at the temperature of vaporization.

42. In an apparatus for generating steam or vapor, the combination with a combustion-chamber and a generator arranged in coöperative relation with the same, of means for supplying a liquid to the generator, means for supplying a fuel to the combustion-chamber, and means for automatically varying said supplies in such manner that the effective supplies of both the liquid and the fuel vary in substantial unison with the variations of demand for steam or vapor energy and at substantially the same degree with said variations and in substantially predetermined quantitative relations to said variations, said generator being of a type in which only a small portion of the liquid is maintained at the temperature of vaporization.

43. In an apparatus for generating steam or vapor and delivering the same in a substantially unvarying condition as to the energy thereof, the combination with a combustion-chamber and a generator arranged in coöperative relation with the same, means for supplying a liquid to the generator, means for supplying a fuel to the combustion-chamber, and means for automatically varying said supplies in such manner that the effective supplies of both the liquid and the fuel vary in substantial unison with the variations of demand for steam or vapor energy and in substantially the same degree with said variations, said generator being of a type in which only a small quantity of the liquid is maintained at the temperature of vaporization.

44. In an apparatus for generating steam or vapor and delivering the same in a substantially unvarying condition as to the temperature and pressure thereof, the combination with a combustion-chamber and a generator arranged in coöperative relation with the same, means for supplying a liquid to the generator, means for supplying a fuel to the combustion-chamber, and means rendered operative by the variations in the condition of the fluid being heated for automatically varying the supplies of both the liquid and the fuel in substantial unison with the variations of demand for steam or vapor energy and in substantially the same degree with said variations, said generator being of a type in which only a small portion of the liquid is maintained at the temperature of vaporization.

45. In an apparatus for generating steam or vapor, the combination with a combustion-chamber and a generator arranged in coöperative relation with the same, of means for supplying a liquid to the generator, means for supplying a fuel to the combustion-chamber, and means rendered operative by variations in the condition of the fluid being heated for automatically varying the supplies of both the liquid and the fuel in substantial unison with the variations of demand for steam or vapor energy and in substantially definite quantitative relations to said variations and in substantially predetermined quantitative relations to said variations, said generator being of a type in which only a small portion of the liquid is maintained at the temperature of vaporization, said generator being so constructed and arranged with relation to the combustion-chamber that the rate of variation of the controlling condition of the fluid therein varies inversely as the quantity of liquid therein varies.

46. In an apparatus for generating steam or vapor, the combination with a combustion-chamber and a generator arranged in coöperative relation with the same, of means for supplying a liquid to the generator, means for supplying a fuel to the combustion-chamber, and means rendered operative by variations in the condition of the fluid being heated for automatically varying said supplies in such manner that the effective supplies of both the liquid and the fuel vary in substantial unison with the variations of demand for steam or vapor energy and in substantially definite quantitative relations with said variations of demand, said generator being so constructed and arranged with relation to the combustion-chamber that the rate of variation of the controlling condition of the fluid therein varies inversely as the quantity of liquid therein varies.

47. In an apparatus for generating steam or vapor and delivering the same in a substantially unvarying condition as to the energy thereof, the combination with a combustion-chamber and a generator arranged in coöperative relation with the same, means for supplying a liquid to the generator, means for supplying a fuel to the combustion-chamber, and means rendered operative by the variations in the condition of the fluid being heated for automatically varying said supplies in such manner that the effective supplies of both the liquid and the fuel vary in substantial unison with the variations of demand for steam or vapor energy and in substantially the same degree with said variations, said generator being so constructed and arranged with relation to the combustion-chamber that the rate of variation of the controlling condition of the fluid therein varies inversely as the quantity of liquid therein varies.

48. In an apparatus for generating steam or vapor and delivering the same in a substantially unvarying condition as to the temperature and pressure thereof, the combination with a combustion-chamber and a generator arranged in coöperative relation with the same, means for supplying a liquid to the generator at a substantially predetermined pressure, means for supplying a fuel to the combustion-chamber, and means rendered operative by the variations in the condition of the fluid being heated for automatically varying said supplies in such manner that the effective supplies of both the liquid and the fuel vary in substantial unison with the variations of demand for steam or vapor energy and in substantially the same degree with said variations of demand, said generator being so constructed and arranged with relation to the combustion-chamber that the rate of variation of the controlling condition of the fluid therein varies inversely as the quantity of liquid therein varies.

49. In an apparatus for generating steam or vapor, the combination with a combustion-chamber and a generator so constructed and arranged with relation to the combustion-chamber that different portions of the generator are heated by the products of combustion to different temperatures, means for supplying a liquid to a cooler portion of the generator, means for supplying fuel to the combustion-chamber, and means for automatically varying the supplies of both the liquid and the fuel in substantial unison with the variations of demand for steam or vapor energy and in substantially definite quantitative relations to said variations.

50. In an apparatus for generating steam or vapor, the combination with a combustion-chamber and a generator so constructed and arranged with relation to the combustion-chamber that different portions of the generator are heated by the products of combustion to different temperatures, means for supplying a liquid to a cooler portion of the generator, means for supplying fuel to the combustion-chamber, and means for automatically varying said supplies in such manner that the effective supplies of both the liquid and the fuel vary in substantial unison with the variations of demand for steam or vapor energy and in substantially definite quantitative relations to said variations.

51. In an apparatus for generating steam or vapor, the combination with a combustion-chamber and a generator so constructed and arranged with relation to the combustion-chamber that different portions of the generator are heated by the products of combustion to different temperatures, means for supplying a liquid to a cooler portion of the generator, means for supplying fuel to the combustion-chamber, and means rendered operative by variations in the condition of the fluid being heated for automatically varying the supplies of both the liquid and the fuel in substantial unison with the variations of demand for steam or vapor energy and in substantially definite quantitative relations to said variations.

52. In an apparatus for generating steam or vapor, the combination with a combustion-chamber and a generator consisting of a plurality of pipe-coils connected together in series and located one within another around the combustion-chamber, means for supplying a liquid to the outer coil, means for supplying a fuel to the combustion-chamber, and means for automatically varying the supplies of both the liquid and the fuel in substantial unison with the variations of demand for steam or vapor energy and in substantially definite quantitative relations to said variations.

53. In an apparatus for generating steam or vapor, the combination with a combustion-chamber and a generator consisting of a plurality of pipe-coils connected together in series and located one within another around the combustion-chamber, of means for supplying a liquid to an outer coil, means for supplying a fuel to the combustion-chamber, and means rendered operative by variations in the condition of the fluid being heated for automatically varying said supplies in such manner that the effective supplies of both the liquid and the fuel vary in substantial unison with the variations of demand for steam or vapor energy and in substantially definite quantitative relations to said variations.

54. In an apparatus for generating steam or vapor and delivering the same in a substantially unvarying condition as to temperature and pressure, the combination with a combustion-chamber and a generator consisting of a plurality of pipe-coils connected together in series and located one within another around the combustion-chamber, means for supplying a liquid to the outer coil, means for supplying a fuel to the combustion-chamber, and means rendered operative by variations in the condition of the fluid being heated for automatically varying said supplies in such manner that the effective supplies of both the liquid and the fuel vary in substantial unison with the variations of demand for steam or vapor energy and in substantially the same degree with said variations of demand.

55. In an apparatus for generating steam or vapor and delivering the same in a substantially unvarying condition as to temperature and pressure, the combination with a combustion-chamber and a generator consisting of a plurality of pipe-coils connected together in series and located one within another around the combustion-chamber, means for supplying liquid to an outer coil at a substantially predetermined pressure, said means being rendered operative by variations in the condition of the fluid being heated to automatically vary the supply of the liquid in substantial unison with the variations of demand for steam or vapor energy and in a substantially definite quantitative relation to said variations of demand, means for supplying a fuel to the combustion-chamber and means rendered operative by variations in the condition of the fluid being heated for maintaining a substantially predetermined quantitative relation between the supplies of the liquid and the fuel.

56. In an apparatus for generating steam or vapor, the combination with a combustion-chamber and a generator consisting of a plurality of pipe-coils located one within another around the combustion-chamber, of means for supplying a liquid to an outer coil, means for supplying a fuel to the combustion-chamber, and means for automatically varying the effective supplies of both the liquid and the fuel in substantial unison with the variations of demand for steam or vapor energy and in substantially definite quantitative relations to said variations, said coils being so connected in series that the liquid is gradually heated and vaporized and is brought to the temperature of vaporization at a point where its flow is not appreciably affected by gravity.

57. In an apparatus for generating steam or vapor, the combination with a combustion-chamber and a generator arranged in coöperative relation with the same, means for supplying a fuel to the combustion-chamber, and means for automatically varying the supplies of both the liquid and the fuel in substantial unison with the variations of demand for steam or vapor energy and in a substantially definite quantitative relation to said variations, said generator having a vaporizing portion adapted to receive a small quantity of the liquid and vaporize it gradually.

58. In an apparatus for generating steam or vapor, the combination with a combustion-chamber and a generator arranged in coöperative relation with the same, said generator having a liquid-heating portion adapted to gradually heat the liquid to the temperature of vaporization, means for supplying the liquid to said generator, means for supplying a fuel to the combustion-chamber, and means for automatically varying the effective supplies of both the liquid and the fuel in substantial unison with the variations of demand for steam or vapor energy and in a substantially predetermined quantitative relation to said variations.

59. In an apparatus for generating superheated steam or vapor, the combination with a combustion-chamber and a generator arranged in coöperative relation with the same, means for supplying a liquid to the generator, means for supplying a fuel to the combustion-chamber, and means for automatically varying the supplies of the liquid and the fuel in substantial unison with the variations of demand for steam or vapor energy and in a substantially definite quantitative relation to said variations, said generator having a liquid-heating portion in which the liquid is gradually heated to the temperature of vaporization, a vaporizing portion adapted to receive a small quantity of the liquid and vaporize it gradually and a superheating portion directly connected to and forming an extension of said vaporizing portion.

60. In an apparatus for generating steam or vapor, the combination with a combustion-chamber and a generator arranged in coöperative relation with the same, of means for supplying a liquid to the generator, means for supplying a fluid fuel to the combustion-chamber, means tending to maintain a substantially predetermined quantitative relation between the flow of the fuel and the flow of the fluid through the generator, and means for automatically varying the relation between the flows of said fluids.

61. In an apparatus for generating steam or vaper, the combination with a combustion-chamber and a generator arranged in coöperative relation with the same, of means for supplying a liquid to the generator, means for supplying a fluid fuel to the combustion-chamber, and means rendered operative by variations in the condition of the fluid being heated for maintaining a substantially predetermined quantitative relation between the flow of the fuel and the flow of the fluid through the generator, and means for automatically varying the relation between the flows of said fluids.

62. In an apparatus for generating steam or vaper, the combination with a combustion-chamber and a generator arranged in coöperative relation with the same, of means for supplying a liquid to the generator, means for supplying a fluid fuel to the combustion-chamber, means rendered operative by variations in a condition of the fluid flowing through the generator resulting from variations in said flow for regulating the flow of the fuel in such manner that the flow of the fuel varies in substantially the same degree and in substantial unison with the variations of the flow of fluid through the generator, and means acting on the flow of one of said fluids for varying the ratio between the flows of said fluids.

63. In an apparatus for generating steam or vaper, the combination with a combustion-chamber and a generator arranged in coöperative relation with the same, of means for supplying a liquid to the generator, means for supplying a fluid fuel to the combustion-chamber, means rendered operative by variations in the pressure of the fluid flowing through the generator for regulating the flow of the fuel in such manner that the flow of the fuel varies in substantially the same degree and in substantial unison with the variations of the flow of fluid through the generator, and means acting on the flow of one of said fluids for varying the ratio between the flows of said fluids.

64. In an apparatus for generating steam or vaper and delivering the same in a substantially unvarying condition as to the temperature thereof, the combination with a combustion-chamber and a generator arranged in coöperative relation with the same, of means for supplying a liquid to the generator, means for supplying a fluid fuel to the combustion-chamber, means rendered operative by variations in a condition of the fluid flowing through the generator resulting from variations in said flow for regulating the flow of the fuel in such manner that the flow of the fuel varies in substantially the same degree and in substantial unison with the variations of the flow of the fluid through the generator, and means acting on the flow of one of said fluids and rendered operative by variations in the temperature of the steam or vaper for varying the ratio between the flows of said fluids.

65. In an apparatus for generating steam or vaper and delivering the same in a substantially unvarying condition as to the temperature and pressure thereof, the combination with a combustion-chamber and a generator arranged in coöperative relation with the same, of means for supplying a liquid to the generator at a substantially predetermined pressure, means for supplying a fluid fuel to the combustion-chamber, means rendered operative by variations in the pressure of the steam or vaper for regulating the flow of the fuel in such manner that the flow of the fuel varies in substantially the same degree and in substantial unison with the variations of the flow of fluid through the generator, and means acting on the flow of one of said fluids and rendered operative by variations in the temperature of the steam or vaper for varying the ratio between the flows of said fluids.

66. In an apparatus for generating steam or vaper and delivering the same in a substantially unvarying condition as to the temperature and pressure thereof, the combination with a combustion-chamber and a generator arranged in coöperative relation with the same, of means for supplying a liquid to the generator at a substantially predetermined pressure, means for supplying a fluid fuel to the combustion-chamber, means rendered operative by variations in a condition of the fluid flowing through the generator resulting from variations in said flow for regulating the flow of the fuel in such manner that the flow of the fuel varies in substantially the same degree and in substantial unison with the variations of the flow of the fluid through the generator, and means acting on the flow of the liquid to the generator and rendered operative by variations in the temperature of the steam or vaper for varying the ratio between the flows of said fluids.

67. In an apparatus for heating fluids, the combination with a fluid-receptacle, of means for supplying a fluid to be heated to said receptacle, said means being constructed to vary the supply of the fluid in substantial unison with the variations of demand for fluid energy and in a definite quantitative relation to said variations, means for supplying a fluid-heating agent to said receptacle, means for maintaining a predetermined quantitative relation between the flow of the heating agent and the flow of fluid through the receptacle, and means for automatically varying the ratio between the flows of said fluids.

68. In an apparatus for heating fluids, the combination with a fluid-receptacle, of means for supplying a fluid to said receptacle, said means being rendered operative by variations in a condition of the fluid being heated to vary the supply of the fluid in substantial unison with the variations of demand for fluid energy and in a substantially definite quantitative relation to said variations, means for supplying a fluid-heating agent to said receptacle, means for regulating the flow of the heating agent by variations in the condition of the fluid being heated in such manner as to maintain a predetermined quantitative relation between the flow of the heating agent and the flow of the fluid through the receptacle, and means for automatically varying the ratio between the flows of said fluids.

69. In an apparatus for heating a fluid and delivering the same at a substantially unvarying temperature, the combination with a fluid-receptacle, of means for supplying the fluid to be heated to said receptacle, said means being rendered operative by variations in the condition of the fluid being heated to vary the supply of the fluid in substantial unison and in a substantially definite quantitative relation to said variations, means for supplying a fluid-heating agent to said receptacle, means for regulating the flow of the heating agent by variations in the condition of the fluid flowing through the receptacle resulting from variations in said flow for maintaining a substantially predetermined quantitative relation between the flows of said fluids and means rendered operative by variations in the temperature of the heated fluid for varying the relation between the flows of said fluids.

70. In an apparatus for heating a fluid, the combination with a fluid-receptacle, of means for supplying the fluid to be heated to said receptacle, means for supplying a fluid-heating agent to said receptacle, means for maintaining a predetermined relation between the flows of said fluids, and means whereby the relation between the flows of said fluids may be varied.

71. In an apparatus for heating a fluid, the combination with a fluid-receptacle, of means for supplying a fluid to be heated to said receptacle, means for supplying a fluid-heating agent to said receptacle, means rendered operative by variations in one condition of the fluid being heated for maintaining a predetermined relation between the flows of said fluids, and means rendered operative by variations in another condition of the fluid being heated for varying the relation between the flows of said fluids.

72. In an apparatus for heating a fluid, the combination with a fluid-receptacle, of means for supplying a fluid to be heated to said receptacle, means for supplying a fluid-heating agent to said receptacle, means rendered operative by variations in the condition of the fluid being heated for regulating the flow of the heating agent in such manner as to maintain a predetermined quantitative relation between the flow of the heating agent and the flow of the fluid through the receptacle, and means for automatically varying the ratio between the flows of said fluids.

73. In an apparatus for heating a fluid, the combination with a fluid-receptacle, of means for supplying the fluid to be heated to said receptacle, means for supplying a fluid-heating agent to said receptacle, means rendered operative by variations in a condition of the fluid flowing through the receptacle resulting from variations in the flow of said fluid for maintaining a predetermined quantitative relation between the flow of the heating agent and the flow of fluid through the receptacle, and means rendered operative by variations in the condition of the fluid for varying the ratio between the flows of said fluids.

74. In a device for maintaining a predetermined quantitative relation between the flows of two fluids, the combination with a motor constructed to be rendered operative by variations in a condition of one fluid resulting from variations in the flow thereof, of means operated by said motor for controlling the flow of the other fluid, and means acting on the flow of one of said fluids for so controlling the operation of said device that the relation between the flows of said fluids may be varied.

75. In a device for maintaining a predetermined quantitative relation between the flows of two fluids, the combination with a conduit for conveying one fluid, said conduit having a restricted passage, of a motor operated by the variations in pressure resulting from variations in the flow of fluid through said restricted passage, means operated by said motor for controlling the flow of the other fluid, and means whereby the relation between the flows of the fluids may be varied.

76. In a device for maintaining a predetermined quantitative relation between the flows of two fluids, the combination with a conduit for conveying one fluid, said conduit having a restricted passage, of a motor operated by the variations in pressure resulting from variations in the flow of fluid through said restricted passage, means operated by said motor for controlling the flow of the other fluid, and means for regulating the size of said restricted passage whereby the predetermined relation between the flows of the fluids may be varied.

77. In a device for maintaining a predetermined quantitative relation between the flows of two fluids, the combination with a motor constructed to be rendered operative by variations in a condition of one fluid resulting from variations in the flow of said fluid, of a valve for controlling the flow of the other fluid, and connections between the motor and one member of said valve, the members of said valves being so shaped

with relation to their relative movement that the flow of one fluid varies in the same degree and in substantial unison with the variations of the flow of the other fluid.

78. In a device for maintaining a predetermined quantitative relation between the flows of two fluids, the combination with conduits for conveying said fluids, one of said conduits having a restricted passage, of a motor communicating with the conduit having the restricted passage and at opposite sides of the restricted passage, a spring for moving said motor in one direction, a valve rendered operative by said motor for varying the size of the restricted passage and a valve rendered operative by said motor for controlling the flow of fluid through the other conduit, said valves being so shaped and proportioned as to maintain a predetermined quantitative relation between the flows of the fluids.

79. In a device for maintaining a predetermined quantitative relation between the flows of two fluids, the combination with two conduits for conveying said fluids, one of said conduits having a restricted passage, of a motor communicating with the conduit having the restricted passage and at opposite sides of the restricted passage, a spring for moving said motor in one direction, a valve rendered operative by said motor for varying the size of the restricted passage, a valve rendered operative by said motor for controlling the flow of fluid through the other conduit, said valves being so relatively shaped and proportioned as to maintain a predetermined quantitative relation between the flows of the fluids, and means for varying the relation between the flows of the fluids at will.

80. In an apparatus for generating superheated steam, the combination with a combustion-chamber and a suitable generator arranged in coöperative relation with the same of means for supplying a fluid fuel to the combustion-chamber, means for supplying water to the generator, said means being rendered operative by variations in the condition of the fluid being heated to automatically vary the effective supply of the water in substantial unison with the variations of demand for steam energy and in a substantially definite quantitative relation to said variations of demand, and means rendered operative by variations in the condition of the fluid flowing through the generator resulting from variations in the flow of said fluid for regulating the flow of fuel in such manner as to maintain a substantially predetermined quantitative relation between the flow of the fuel and the flow of the fluid through the generator.

81. In an apparatus for generating superheated steam, the combination with a combustion-chamber and a suitable generator arranged in coöperative relation with the same, of means for supplying a fluid fuel to the combustion-chamber, means for supplying water to the generator, said means being rendered operative by variations in the condition of the fluid being heated to automatically vary the effective supply of the water in substantial unison with the variations of demand for steam energy and in a substantially definite quantitative relation to said variations of demand, and means rendered operative by variations in the condition of the fluid flowing through the generator resulting from variations in the flow of said fluid for regulating the flow of fuel in such manner as to maintain a substantially predetermined quantitative relation between the flow of the fuel and the flow of the fluid through the generator, and means for varying the relation between the flows of said fluids.

82. In an apparatus for generating superheated steam, the combination with a combustion-chamber and a suitable generator arranged in coöperative relation with the same, means for supplying a fluid fuel to the combustion-chamber, means for supplying water to the generator, said means being constructed to automatically vary the supply of water in substantial unison with the variations of demand for steam energy and in a substantially definite quantitative relation to said variations, means rendered operative by variations in one condition of the fluid being heated for maintaining a substantially predetermined quantitative relation between the flow of the fuel and the flow of the fluid through the generator, and means rendered operative by another condition of the fluid being heated for varying the relation between the said flows.

83. In an apparatus for generating superheated steam and delivering the same at a substantially uniform temperature, the combination with a combustion-chamber and a generator arranged in coöperative relation with the same, of means for supplying water to the generator, means for supplying fluid fuel to the combustion-chamber, means rendered operative by variations in one condition of the fluid being heated for maintaining a substantially predetermined quantitative relation between the flow of the fuel and the flow of the fluid through the generator, and means rendered operative by another condition of the fluid being heated for automatically varying the relation between the flows of said fluids.

84. In an apparatus for generating superheated steam and delivering the same at a substantially uniform temperature, the combination with a combustion-chamber and a generator arranged in coöperative relation with the same, of means for supplying water to the generator, means for supplying a fluid fuel to the combustion-chamber, means rendered operative by variations in one condition of the fluid being heated for maintaining a substantially predetermined quantitative relation between the flow of the fuel and the flow of fluid through the generator, and means rendered operative by variations in another condition of the fluid being heated and acting upon the supply of the water to the generator to vary the relation between the flows of said fluids.

85. In an apparatus for generating superheated steam, the combination with a combustion-chamber and generator having a single continuous passage so arranged with relation to the combustion-chamber that different portions of it are subjected to the action of products of combustion of different temperatures, means for supplying water to a cooler portion of the generator, means for supplying a fluid fuel to the combustion-chamber, and means for automatically varying the supplies of both the water and the fuel in substantial unison with the variations of demand for steam energy and in substantially definite quantitative relations to said variations.

86. In an apparatus for generating superheated steam, the combination with a combustion-chamber and a generator having a single continuous passage so arranged with relation to the combustion-chamber that different portions of it are subjected to the action of products of combustion of different temperatures, means for supplying water to a cooler portion of the generator, means for supplying a fluid fuel to the combustion-chamber, and means rendered operative by variations in the condition of the fluid being heated for automatically varying the supplies of both the water and the fuel in substantial unison with the variations of demand for steam energy and in substantially definite quantitative relations to said variations.

87. In an apparatus for generating superheated steam, the combination with a combustion-chamber and a generator having a single continuous passage so arranged with relation to the combustion-chamber that different portions of it are subjected to the action of products of combustion of different temperatures, of means for supplying water to a cooler portion of the generator at a substantially predetermined pressure, means for supplying a fluid fuel to the combustion-chamber, and means rendered operative by variations in the condition as to pressure of the fluid being heated for automatically varying the supplies of both the water and the fuel in substantial unison with the variations of demand for steam energy and in substantially definite quantitative relations to said variations.

88. In an apparatus for generating superheated steam, the combination with a combustion-chamber and a generator having a single continuous passage so arranged with relation to the combustion-chamber that different portions of it are subjected to the action of products of combustion of different temperatures, means for supplying water to the generator, said means being constructed to automatically vary the supply of water in substantial unison with the variations of demand for steam energy and in a definite quantitative relation to said variations, means for supplying a fluid fuel to the combustion-chamber and means for maintaining a predetermined quantitative relation between the flow of the fuel and the flow of fluid through the generator.

89. In an apparatus for generating superheated steam, the combination with a combustion-chamber and a generator having a single continuous passage so arranged with relation to the combustion-chamber that different portions of it are subjected to the action of products of combustion of different temperatures, means for supplying water to a cooler portion of the generator, said means being rendered operative by variations in the condition of the fluid being heated for automatically varying the supply of water in substantially the same degree and in substantial unison with the variations of demand for steam energy, means for supplying a fluid fuel to the combustion-chamber, and means rendered operative by variations in the condition of the fluid being heated for maintaining a predetermined quantitative relation between the flow of the fuel and the flow of fluid through the generator.

90. In an apparatus for generating superheated steam, the combination with a combustion-chamber and a generator having a single continuous passage so arranged with relation to the combustion-chamber that different portions of it are subjected to the action of products of combustion of different temperatures, means for supplying water to a cooler portion of the generator, said means being rendered operative by variations in the condition of the fluid being heated for automatically varying the supply of water in substantially the same degree and in substantial unison with the variations of demand for steam energy, means for supplying a fluid fuel to the combustion-chamber, means rendered operative by variations in a condition of the fluid flowing through the generator resulting from variations in the flow of said fluid for maintaining a predetermined qantitative relation between the flow of the fuel and the flow of fluid through the generator.

91. In an apparatus for generating superheated steam, the combination with a combustion-chamber and a generator having a single continuous passage so arranged with relation to the combustion-chamber that different portions of it are subjected to the action of products of combustion of different temperatures, means for supplying water to a cooler portion of the generator at a substantially unvarying pressure, said means be-

ing rendered operative by variations in the condition as to pressure of the fluid being heated to automatically vary the supply of the liquid in substantially the same degree and in substantial unison with the variations of demand for steam energy, means for supplying a fluid fuel to the combustion-chamber, and means rendered operative by variations in a differential pressure resulting from variations in the flow of fluid through the generator for maintaining a substantially predetermined quantitative relation between the flow of the fuel and the flow of fluid through the generator.

92. In an apparatus for generating superheated steam, the combination with a combustion-chamber and a generator arranged in coöperative relation with the same, of means for supplying water to the generator at a substantially predetermined pressure, means for supplying a fluid fuel to the combustion-chamber, and means rendered operative by variations in the pressure of the fluid being heated for automatically varying the supplies of both the water and the fuel in substantial unison with the variations of demand for steam energy and in substantially definite quantitative relations to said variations, said generator being of a type in which only a small quantity of the liquid is maintained at the temperature of vaporization.

93. In an apparatus for generating superheated steam and delivering the same in a substantially unvarying condition as to temperature and pressure, the combination with a combustion-chamber and a generator arranged in coöperative relation with the same, of means for supplying water to the generator at a substantially predetermined pressure, means for supplying a fluid fuel to the combustion-chamber, and means rendered operative by variations in the pressure of the fluid being heated for automatically varying said supplies in such manner that the effective supplies of both the liquid and the fuel vary in substantial unison with the variations of demand for steam energy and in substantially the same degree with said variations, said generator being of a type in which only a small quantity of the water is maintained at the temperature of vaporization.

94. In an apparatus for generating superheated steam, the combination with a combustion-chamber and a generator arranged in coöperative relation with the same, of means for supplying a liquid to the generator at a substantially predetermined pressure, means for supplying a fluid fuel to the combustion-chamber, and means rendered operative by variations in the pressure of the fluid being heated for automatically varying the supplies of both the liquid and the fuel in substantial unison with the variations of demand for steam energy and in substantially definite quantitative relations to said variations of demand, said generator being so constructed and arranged with relation to the combustion-chamber that the rate of variation of the controlling condition of the fluid therein varies inversely as the quantity of water therein varies.

95. In an apparatus for generating superheated steam and delivering the same in a substantially unvarying condition as to temperature and pressure, the combination with a combustion-chamber and a generator arranged in coöperative relation with the same, of means for supplying water to the generator at a substantially predetermined pressure, means for supplying a fluid fuel to the combustion-chamber, and means rendered operative by variations in the pressure of the fluid being heated for automatically varying said supplies in such manner that the effective supplies of both the liquid and the fuel vary in substantial unison with the variations of demand for steam energy and in substantially definite quantitative relations to said variations of demand, said generator being so constructed and arranged with relation to the combustion-chamber that the rate of variation of the controlling condition of the fluid therein varies inversely as the quantity of liquid therein varies.

96. In an apparatus for generating superheated steam, the combination with a combustion-chamber and a generator consisting of a plurality of pipe-coils connected together in series and located one within another around the combustion-chamber, of means for supplying water to an outer coil at a substantially predetermined pressure, means for supplying a fluid fuel to the combustion-chamber, and means rendered operative by variations in the pressure of the fluid being heated for automatically varying the supplies of both the water and the fuel in substantial unison with the variations of demand for steam energy and in substantially definite quantitative relations to said variations of demand.

97. In an apparatus for generating superheated steam and delivering the same in a substantially unvarying condition as to temperature and pressure, the combination with a combustion-chamber and a generator consisting of a plurality of pipe-coils connected together in series and located one within another around the combustion-chamber, of means for supplying water to an outer coil at a substantially predetermined pressure, means for supplying a fluid fuel to the combustion-chamber, and means rendered operative by variations in the pressure of the fluid being heated for automatically varying said supplies in such manner that the effective supplies of both the liquid and the fuel vary in substantial unison with the variations of demand for steam energy and in substantially the same degree with said variations of demand.

98. In an apparatus for generating superheated steam, the combination with a combustion-chamber and a generator consisting of a plurality of pipe-coils connected together in series and located one within another around the combustion-chamber, means for supplying water to the outer coil at a substantially predetermined pressure, said means being rendered operative by variations in the pressure of the fluid being heated to automatically vary the supply of the water in substantial unison with the variations of demand for steam energy and in substantially the same degree with said variations of demand, means for supplying fuel to the combustion-chamber, and means rendered operative by variations in a condition of the fluid flowing through the generator resulting from variations in the flow of said fluid for maintaining a substantially predetermined quantitative relation between the flow of the fuel and the flow of the fluid through the generator.

99. In an apparatus for generating superheated steam, the combination with a combustion-chamber and a generator consisting of a plurality of pipe-coils located one within another around the combustion-chamber, means for supplying water to an outer coil, means for supplying a fluid fuel to the combustion-chamber, and means rendered operative by variations in the condition of the fluid being heated for automatically varying the supplies of both the water and the fuel in substantial unison with the variations of demand for steam energy and in substantially definite quantitative relations to said variations of demand, said coils being so connected in series that the liquid is gradually heated and vaporized and is brought to the temperature of vaporization at a point where its flow is not appreciably affected by gravity.

100. In an apparatus for generating superheated steam and delivering the same in a substantially unvarying condition as to the energy thereof, the combination with a combustion-chamber and a generator consisting of a plurality of pipe-coils located one within another around the combustion-chamber, means for supplying water to an outer coil, means for supplying a fluid fuel to the combustion-chamber, and means rendered operative by variations in the condition of the fluid being heated for automatically varying said supplies in such manner that the effective supplies of both the water and the fuel vary in substantial unison with the variations of demand for steam energy and in substantially the same degree with said variations, said coils being so connected in series that liquid is gradually heated and vaporized and is brought to the temperature of vaporization at a point where its flow is not appreciably affected by gravity.

101. In an apparatus for generating superheated steam and delivering the same in a substantially unvarying condition as to temperature and pressure, the combination with a combustion-chamber and a generator consisting of a plurality of pipe-coils located one within another around the combustion-chamber, of means for supplying water to the outer coil at a substantially predetermined pressure, means for supplying a fluid fuel to the combustion-chamber, and means rendered operative by variations in the pressure of the fluid being heated for automatically varying said supplies in such manner that the effective supplies of both the water and the fuel vary in substantial unison with the variations of demand for steam energy and in substantially the same degree with said variations of demand, said coils being so connected in series that the liquid is gradually heated and vaporized and is brought to the temperature of vaporization at a point where its flow is not appreciably affected by gravity.

102. In an apparatus for generating superheated steam, the combination with a combustion-chamber and a generator arranged in coöperative relation with the same, means for supplying water to the generator, means for supplying a fluid fuel to the combustion-chamber, and means rendered operative by variations in the condition of the fluid being heated for automatically varying the supplies of the liquid and the fuel in substantial unison with the variations of demand for steam energy and in substantially predetermined quantitative relations to said variations of demand, said generator having a water-heating portion in which the water is gradually heated to the temperature of vaporization, a vaporizing portion adapted to receive a small quantity of the water and vaporize it gradually, and a superheating portion directly connected to and forming an extension of said vaporizing portion.

103. In an apparatus for generating superheated steam, the combination with a combustion-chamber and a generator arranged in coöperative relation with the same, means for supplying water to the generator, means for supplying a fluid fuel to the combustion-chamber, means rendered operative by variations in the condition of the fluid being heated for automatically varying said supplies in such manner that the effective supplies of both the water and the fuel vary in substantial unison with the variations of demand for steam energy and in substantially the same degree with said variations, said generator having a water-heating portion in which the water is gradually heated to the temperature of vaporization, a vaporizing portion adapted to receive a small quantity of the liquid and vaporize it gradually, and a superheating portion directly connected to and forming an extension of said vaporizing portion.

104. In an apparatus for generating superheated steam and delivering it in a substantially unvarying condition as to temperature and pressure, the combination with a combustion-chamber and a generator arranged in coöperative relation with the same, means for supplying water to the generator at a substantially uniform pressure, means for supplying a fluid fuel to the combustion-chamber, and means rendered operative by variations in the pressure of the fluid being heated for automatically varying said supplies in such manner that the effective supplies of both the water and the fuel vary in substantial unison with the variations of demand for steam energy and in substantially the same degree with said variations, said generator having a heating portion in which the water is gradually heated to the temperature of vaporization, a vaporizing portion adapted to receive a small quantity of the water and vaporize it gradually and a superheating portion directly connected to and forming an extension of said vaporizing portion.

105. In an apparatus for generating superheated steam and delivering the same at a substantially unvarying temperature, the combination with a combustion-chamber and a generator arranged in coöperative relation with the same, of means for supplying water to the generator, means for supplying a fluid fuel to the combustion-chamber, means tending to maintain a substantially predetermined quantitative relation between the flow of the fuel and the flow of fluid through the generator, and means for automatically varying the relation between the flows of said fluids, said generator being of a type in which only a small quantity of the water is maintained at the temperature of vaporization.

106. In an apparatus for generating superheated steam and delivering the same at a substantially unvarying temperature, the combination with a combustion-chamber and a generator arranged in coöperative relation to the same, means for supplying water to the generator, means for supplying a fluid fuel to the combustion-chamber, means rendered operative by variations in the condition of the fluid being heated for maintaining a substantially predetermined quantitative relation between the flow of the fuel and the flow of the fluid through the generator, and means for automatically varying the relation between the flows of said fluids.

107. In an apparatus for generating superheated steam and delivering the same at a substantially unvarying temperature, the combination with a combustion-chamber and a generator arranged in coöperative relation with the same, of means for supplying water to the generator, means for supplying a fluid fuel to the combustion-chamber, means rendered operative by variations in one condition of the fluid being heated for maintaining a substantially predetermined quantitative relation between the flow of the fuel and the flow of the fluid through the generator, and means rendered operative by variations in another condition of the fluid being heated for automatically varying the relation between the flows of said fluids.

108. In an apparatus for generating superheated steam and delivering the same at a substantially unvarying temperature, the combination with a combustion-chamber and a generator arranged in coöperative relation with the same, of means for supplying water to the generator, means for supplying a fluid fuel to the combustion-chamber, means rendered operative by variations in a condition of the fluid flowing through the generator resulting from variations in the flow of said fluid for maintaining a substantially predetermined quantitative relation between the flow of the fuel and the flow of fluid through the generator, and means rendered operative by variations in the temperature of the superheated steam for automatically varying the relation between the flows of said fluids.

109. In an apparatus for generating steam or vapor, the combination with a combustion-chamber and a generator arranged in coöperative relation with the same, of means for supplying liquid to the generator, means for supplying a fluid fuel to the combustion-chamber at a substantially predetermined pressure, a nozzle for delivering the fuel to the combustion-chamber and means acting on the flow of the fuel at the nozzle for so regulating said flow that the flow of fuel varies in substantial unison with the variations of the flow of fluid through the generator and according to a substantially predetermined quantitative relation to said variations.

110. In an apparatus for generating steam or vapor, the combination with a generator and a burner arranged in coöperative relation with the same, of means for supplying liquid to the generator, means for supplying a fluid fuel to the combustion-chamber at a predetermined pressure, a nozzle for delivering the fuel to the combustion-chamber, and means rendered operative by variations in the fluid being heated and acting on the flow of fuel at the nozzle for so regulating said flow that it varies in substantial unison with the variations of the flow of fluid through the generator and according to a substantially predetermined quantitative relation to said variations.

111. In an apparatus for generating superheated steam or vapor, the combination with a combustion-chamber and a generator arranged in coöperative relation with the same, of means for supplying liquid to the said generator, said means being constructed to automatically vary the supply of liquid in substantial unison with the variations of demand for steam or vapor energy and in a substantially definite quantitative relation to said variations, means for supplying a fluid fuel to the combustion-chamber at a predetermined pressure, a nozzle for delivering fuel to the combustion-chamber, and means controlled by variations in the condition of the fluid being heated and acting on the flow of the fuel at the nozzle for so regulating said flow as to maintain a substantially predetermined quantitative relation between the flow of the fuel and the flow of the fluid through the generator.

112. In an apparatus for generating steam or vapor and delivering the same in a substantially unvarying condition as to temperature and pressure, the combination with a combustion-chamber and a generator arranged in coöperative relation with the same, of means for supplying a liquid to the generator at a substantially predetermined pressure, said means being rendered operative by variations in the condition of the fluid being heated for automatically varying the supply of fuel in substantial unison with the variations of demand for steam or vapor energy and in substantially the same degree with said variations of demand, means for supplying a fluid fuel to the combustion-chamber at a predetermined pressure, a nozzle for delivering the fuel to the combustion-chamber, and means controlled by variations in a condition of the fluid flowing through the generator resulting from variations in the flow of said fluid and acting on the flow of fuel at the nozzle for so regulating the flow of fuel as to maintain a substantially predetermined quantitative relation between the flow of fuel and the flow of fluid through the generator.

113. In an apparatus for superheating steam, the combination with a superheater, of means for supplying steam to the superheater, means for supplying a fluid-heating agent for heating the superheater, and means for automatically varying the effective supply of the heating agent in substantial unison with the variations of demand for superheated steam and in a substantially predetermined quantitative relation to said variations of demand.

114. In an apparatus for superheating steam, the combination with a superheater, of means for supplying steam to the superheater, means for supplying a fluid-heating agent for heating the superheater, and means rendered operative by variations in the condition of the fluid flowing through the superheater for automatically varying the effective supply of the heating agent in substantial unison with the variations in demand of superheated steam and in a substantially predetermined quantitative relation to said variations of demand.

115. In an apparatus for superheating steam, the combination with a superheater, of means for supplying steam to the superheater, means for supplying a fluid-heating agent for heating the superheater, and means rendered operative by variations in a condition of the fluid flowing through the superheater resulting from variations in said flow for automatically varying the effective supply of the heating agent in substantial unison with the variations of demand for superheated steam and in a substantially predetermined quantitative relation to said variations of demand.

116. In an apparatus for superheating steam, the combination with a superheater, of means for supplying steam to the superheater, means for supplying a fluid-heating agent for heating the superheater, and means for automatically varying the effective supply of the heating agent in the same degree and in substantial unison with the variations of demand for superheated steam.

117. In an apparatus for superheating steam, the combination with a superheater, of means for supplying steam to the superheater, means for supplying a fluid-heating agent for heating the superheater, and means rendered operative by variations in one condition of the fluid flowing through the superheater for automatically varying the effective supply of the heating agent in a substantially predetermined quantitative relation with and in substantial unison with the variations of demand for superheated steam, and means rendered operative by another condition of the said fluid for varying the relation between the supply of the heating agent and the demand for steam.

118. In an apparatus for superheating steam, the combination with a superheater, of means for supplying steam to the superheater, means for supplying a fluid-heating agent for heating the superheater, and means for automatically varying the effective supply of the heating agent in substantial unison with the variations of demand for superheated steam and in a substantially predetermined quantitative relation to said variations, and means rendered operative by variations of the temperature of the superheated steam for varying the relation between the supply of the heating agent and the demand for steam.

119. In an apparatus for superheating steam, the combination with a superheater, of means for supplying steam to the superheater, means for supplying the fluid-heating agent for heating the superheater, and means rendered operative by variations in a condition of the fluid flowing through the superheater resulting from variations in said flow for automatically varying the effective supply of the heating agent in substantial unison with the variations of demand for superheated steam and in a substantially predetermined quantitative relation to said variations of demand, and

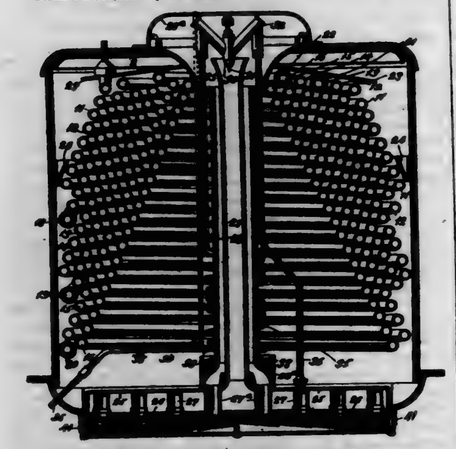
means rendered operative by variations of the temperature of the superheated steam for varying the relation between the supply of the heating agent and the demand for steam.

120. In an apparatus for superheating steam, the combination with a superheater, the effective heating-surface of which is automatically varied inversely and in substantial unison with the variations of demand for superheated steam, means for supplying a fluid-heating agent for heating the superheater, and means for automatically varying the effective supply of the heating agent in substantial unison with the variations of demand for superheated steam and in a substantially predetermined quantitative relation to said variations of demand.

121. In an apparatus for superheating steam, the combination with a superheater, the effective heating-surface of which is automatically varied inversely and in substantial unison with the variations of demand for superheated steam, means for supplying a fluid-heating agent for heating the superheater, and means for automatically varying the effective supply of the heating agent in substantially the same degree and in substantial unison with the variations of demand for superheated steam.

122. In an apparatus for superheating steam, the combination with a superheater, the effective heating-surface of which is automatically varied inversely and in substantial unison with the variations of demand for superheated steam, means for supplying a fluid-heating agent for heating the superheater, means rendered operative by variations in the condition of the fluid flowing through the superheater for automatically varying the effective supply of the heating agent in substantial unison with the variations of demand for superheated steam and in a substantially predetermined quantitative relation to said variations of demand, and means rendered operative by variations in the temperature of the superheated steam for varying the relation between the supply of the heating agent and the demand for superheated steam.

704,908. ART OF GENERATING STEAM OR VAPOR. EDWARD C. HEWCOMB, Jamaica Plain, Mass. Original application filed June 7, 1901, Serial No. 63,565. Divided and this application filed Apr. 3, 1902. Serial No. 101,261. (No model.)



Claims.—1. The method of generating superheated steam or vapor, which method consists in supplying a liquid to a suitable generator, supplying a fuel for heating the generator, and varying the supplies of both the liquid and the fuel in substantial unison with the variations of demand for steam or vapor energy and in definite quantitative relations to said variations.

2. The method of generating superheated steam or vapor, which method consists in supplying a liquid to a suitable generator, supplying a fuel for heating the generator, and by variations in the condition of the fluid being heated varying the supplies of both the liquid and the fuel in substantial unison with the variations of demand for steam or vapor energy and in definite quantitative relations to said variations of demand.

3. The method of generating superheated steam or vapor, which method consists in supplying a liquid to a suitable generator at a substantially predetermined pressure, supplying a fuel for heating the generator, and by variations in the condition as to pressure of the fluid being heated varying the supplies of both the liquid and the fuel in substantial unison with the variations of demand for steam or vapor energy and in definite quantitative relations to said variations of demand.

4. The method of generating superheated steam or vapor, which method consists in supplying a liquid to a suitable generator, supplying a fuel for heating the generator, and varying said supplies in such manner that the effective supplies of both the liquid and the fuel vary in substantial unison with the variations of demand for steam or vapor energy and in substantially definite quantitative relations to said variations.

5. The method of generating superheated steam or vapor, which method consists in supplying a liquid to a suitable generator, supplying a fuel for heating the generator, and varying said supplies by variations in the condition of the fluid being heated in such manner that the effective supplies of both the liquid and the fuel vary in substantial unison with the variations of demand for steam or vapor energy and in substantially definite quantitative relations to said variations of demand.

6. The method of generating superheated steam or vapor, which method consists in supplying a liquid to a suitable generator at a substantially predetermined pressure, supplying a fuel for heating the generator, and varying said supplies by variations in the condition as to pressure of the fluid being heated in such manner that the effective supplies of both the liquid and the fuel vary in substantial unison with the variations of demand for steam or vapor energy and in substantially definite quantitative relations to said variations of demand.

7. The method of generating superheated steam or vapor, which method consists in supplying a liquid to a suitable generator, supplying a fuel for heating the generator, and varying the supplies of both the liquid and the fuel in substantial unison with the variations of demand for steam or vapor energy and in the same degree with said variations.

8. The method of generating superheated steam or vapor, which method consists in supplying a liquid to a suitable generator, supplying a fuel for heating the generator, and by variations in the condition of the fluid being heated varying the supplies of both the liquid and the fuel in substantial unison with the variations of demand for steam or vapor energy and in the same degree with said variations.

9. The method of generating superheated steam or vapor, which method consists in supplying a liquid to a suitable generator at a substantially predetermined pressure, supplying a fuel for heating the generator, and by variations in the condition as to pressure of the fuel being heated varying the supplies of both the liquid and the fuel in substantial unison with the variations of demand for steam or vapor energy and in the same degree with said variations of demand.

10. The method of generating superheated steam or vapor and delivering the same in a substantially unvarying condition as to the energy thereof, which method consists in supplying a liquid to a suitable generator, supplying a fuel for heating the generator, and varying said supplies in such manner that the effective supplies of both the liquid and the fuel vary in substantial unison with the variations of demand for steam or vapor energy and in substantially the same degree with said variations.

11. The method of generating superheated steam or vapor and delivering the same in a substantially unvarying condition as to the energy thereof, which method consists in supplying a liquid to a suitable generator, supplying a fuel for heating the generator, and varying said supplies by variations in the condition of the fluid being heated in such a manner that the effective supplies of both the liquid and the fuel vary in substantial unison with the variations of demand for steam or vapor energy and in substantially the same degree with said variations of demand.

12. The method of generating superheated steam or vapor and delivering same in a substantially unvarying condition as to temperature and pressure, which method consists in supplying a liquid to a suitable generator at a substantially predetermined pressure, supplying a fuel for heating the generator, and varying said supplies by variations in the condition as to pressure of the fluid being heated in such manner that the effective supplies of both the liquid and the fuel vary in substantial unison with the variations of demand for steam or vapor energy and in substantially the same degree with said variations of demand.

13. The method of generating superheated steam or vapor, which method consists in supplying a liquid to a suitable generator, supplying a fuel for heating the generator, varying the supply of the liquid in substantial unison with the variations of demand for steam or vapor energy and in a substantially definite quantitative relation to said variations, and maintaining a predetermined quantitative relation between the supplies of the liquid and the fuel.

14. The method of generating superheated steam or vapor, which method consists in supplying a liquid to a suitable generator, supplying a fuel for heating the generator, varying the supply of the liquid by variations in the condition of the fluid being heated in such manner that the effective supply of the liquid varies in substantial unison with the variations of demand for steam or vapor energy and in a substantially definite quantitative relation to said variations of demand, and maintaining a predetermined quantitative relation between the supplies of the liquid and the fuel.

15. The method of generating superheated steam or vapor, which method consists in supplying a liquid to a suitable generator at a substantially predetermined pressure, supplying a fuel for heating the generator, varying the supply of the liquid by variations in the condition as to pressure of the fluid being heated in such manner that the effective supply of the liquid varies in substantial unison with the variations of demand for steam or vapor energy and in a substantially definite quantitative relation to said variations of demand, and maintaining a predetermined quantitative relation between the supplies of the liquid and the fuel.

16. The method of generating superheated steam or vapor, which method consists in supplying a liquid to a suitable generator, supplying a fuel for heating the generator, varying the supply of the liquid in substantial unison with the variations of demand for steam or vapor energy and in substantially the same degree with said variations, and maintaining a predetermined quantitative relation between the supplies of the liquid and the fuel.

17. The method of generating superheated steam or vapor, which method consists in supplying a liquid to a suitable generator, supplying a fuel for heating the generator, varying the supply of the liquid by variations in the condition of the fluid being heated in such manner that the effective supply of the liquid varies in substantial unison with the variations of demand for steam or vapor energy and in substantially the same degree with said variations of demand, and maintaining a predetermined quantitative relation between the supplies of the liquid and the fuel.

18. The method of generating superheated steam or vapor, which method consists in supplying a liquid to a suitable generator at a substantially predetermined pressure, supplying a fuel for heating the generator, varying the supply of the liquid by variations in the condition as to pressure of the fluid being heated in such manner that the effective supply of the liquid varies in substantial unison with the variations of demand for steam or vapor energy and in substantially the same degree with said variations of demand, and maintaining a predetermined quantitative relation between the supplies of the liquid and the fuel.

19. The method of generating superheated steam or vapor, which method consists in supplying a liquid to a suitable generator, supplying a fuel for heating the generator, varying the supply of the liquid in substantial unison with the variations of demand for steam or vapor energy and in a substantially definite quantitative relation to said variations, and regulating the supply of fuel by variations in the condition of the fluid flowing through the generator in such manner that the effective supply of the fuel varies in substantial unison with the variations of the flow of fluid through the generator and according to a predetermined quantitative relation to said variations of flow.

20. The method of generating superheated steam or vapor, which method consists in supplying a liquid to a suitable generator, supplying a fuel for heating the generator, varying the supply of the liquid in substantial unison with the variations of demand for steam or vapor energy and in a substantially definite quantitative relation to said variations, and regulating the supply of fuel by variations in a condition of the fluid flowing through the generator resulting from variations in the flow of said fluid in such manner that the effective supply of the fuel varies in substantial unison with the variations of the flow of fluid through the generator and according to a predetermined quantitative relation to said variations of flow.

21. The method of generating superheated steam or vapor, which method consists in supplying a liquid to a suitable generator at a substantially predetermined pressure, supplying a fuel for heating the generator, varying the supply of the liquid by variations in the condition as to pressure of the fluid being heated in such manner that the effective supply of the liquid varies in substantial unison with the variations of demand for steam or vapor energy and in a substantially definite quantitative relation to said variations of demand, and regulating the supply of fuel by variations in the condition as to pressure of the fluid flowing through the generator in such manner that the effective supply of the fuel varies in substantial unison with the variations of the flow of fluid through the generator and according to a predetermined quantitative relation to said variations of flow.

22. The method of generating superheated steam or vapor and delivering the same in a substantially unvarying condition as to the energy thereof, which method consists in supplying a liquid to a suitable generator, supplying a fuel for heating the generator, varying the supply of the liquid in substantial unison with the variations of demand for steam or vapor energy and in substantially the same degree with said variations, and regulating the supply of fuel by variations in the condition of the fluid flowing through the generator resulting from variations in the flow of said fluid in such manner that the effective supply of the fuel varies in substantial unison with the variations of the flow of fluid through the generator and in substantially the same degree with said variations of flow.

23. The method of generating superheated steam or vapor and delivering the same in a substantially unvarying condition as to the energy thereof, which method consists in supplying a liquid to a suitable generator, supplying a fuel for heating the generator, varying the supply of the liquid in substantial unison with the variations of demand for steam or vapor energy and in substantially the same degree with said variations, and regulating the supply of fuel by variations in a condition of the fluid flowing through the generator resulting from variations in the flow of said fluid in such manner that the effective supply of fuel varies in substantial unison with the variations in the flow of fluid through the generator and in substantially the same degree with said variations of flow.

24. The method of generating superheated steam or vapor and delivering the same in a substantially unvarying condition as to temperature and pressure, said method consisting in supplying a liquid to a suitable generator at a substantially predetermined pressure, supplying a fuel for heating the generator, and varying the supply of the liquid by variations in the condition as to pressure of the fluid being heated in such manner that the effective supply of liquid varies in substantial unison with the variations of demand for steam or vapor energy and in substantially the same degree with said variations of demand, and regulating the supply of fuel by variations in the condition as to pressure of the fluid flowing through the generator in such manner that the effective supply of the fuel varies in substantial unison with the variations of the flow of fluid through the generator and in substantially the same degree with said variations of flow.

25. The method of generating steam or vapor, which method consists in supplying a liquid to a suitable generator, supplying a fuel for heating the generator, varying the supply of the liquid in substantial unison with the variations of demand for steam or vapor energy and in a substantially definite quantitative relation to said variations, establishing a predetermined quantitative relation between the supplies of the liquid and the fuel, and regulating the temperature of the steam or vapor by varying the relation between said supplies.

26. The method of generating steam or vapor, which method consists in supplying a liquid to a suitable generator, supplying a fuel for heating the generator, varying the supply of the liquid in substantial unison with the variations of demand for steam or vapor energy and in a substantially definite quantitative relation to said variations, regulating the supply of fuel by variations in the condition of the fluid being heated in a manner tending to maintain a predetermined quantitative relation between the supplies of the liquid and the fuel, and regulating the temperature of the steam or vapor by varying the relation between said supplies.

27. The method of generating steam or vapor, which method consists in supplying a liquid to a suitable generator, supplying a fuel for heating the generator, varying the supply of the liquid in substantial unison with the variations of demand for steam or vapor energy and in substantially the same degree with said variations, establishing a predetermined relation between the supplies of the liquid and the fuel, and regulating the temperature of the steam or vapor by varying the relation between said supplies.

28. The method of generating steam or vapor, which method consists in supplying a liquid to a suitable generator, supplying a fuel for heating the generator, varying the supply of the liquid in substantial unison with the variations of demand for steam or vapor energy and in substantially the same degree with said variations, regulating the supply of fuel by variations in a condition of the fluid flowing through the generator resulting from variations in the flow of said fluid in a manner tending to maintain a predetermined quantitative relation between the supplies of the liquid and the fuel, and regulating the temperature of the steam or vapor by varying the relation between said supplies.

29. The method of generating steam or vapor, and delivering the same at a substantially uniform temperature, said method consisting in supplying a liquid to a suitable generator, supplying a fuel for heating the generator, varying the supply of the liquid in substantial unison with the variations of demand for steam or vapor energy and in a substantially definite quantitative relation to said variations, establishing a predetermined quantitative relation between the supplies of the liquid and the fuel, and varying the relation between said supplies by variations in the temperature of the steam or vapor.

30. The method of generating steam or vapor and delivering the same at a substantially unvarying temperature, said method consisting in supplying a liquid to a suitable generator, supplying a fuel for heating the generator, varying the supply of the liquid in substantial unison with the variations of demand for steam or vapor energy in a substantially definite quantitative relation to said variations, regulating the supply of fuel by variations in a condition of the fluid flowing through the generator resulting from variations in the flow of said fluid in a manner tending to maintain a predetermined quantitative relation between the supplies of the liquid and the fuel, and varying the relation between said supplies by variations in the temperature of the steam or vapor.

31. The method of generating steam or vapor and delivering the same at a substantially unvarying temperature, said method consisting in supplying a liquid to a suitable generator, supplying a fuel for heating the

generator, varying the supply of the liquid in substantial unison with the variations of demand for steam or vapor energy and in substantially the same degree with said variations, establishing a predetermined quantitative relation between the supplies of the liquid and the fuel, and varying the relation between said supplies by variations in the temperature of the steam or vapor.

32. The method of generating steam or vapor and delivering the same at a substantially unvarying temperature and pressure, said method consisting in supplying a liquid to a suitable generator at a substantially predetermined pressure, supplying a fuel for heating the generator, varying the supply of the liquid by variations in the pressure of the fluid being heated in such manner that the effective supply of the liquid varies in substantial unison with the variations of demand for steam or vapor energy and in substantially the same degree with said variations of demand, regulating the supply of the fuel by variations in a condition of the fluid flowing through the generator resulting from variations in the flow of said fluid in a manner tending to maintain a predetermined quantitative relation between the supplies of the liquid and the fuel, and varying the relation between said supplies by variations in the temperature of the steam or vapor.

33. The method of generating steam or vapor, which method consists in supplying a liquid to a suitable generator, heating the generator in such manner that only a small quantity of the liquid is maintained at the temperature of vaporization, varying the supplies of both the liquid and the heat in substantial unison with the variations of demand for steam or vapor energy and in definite quantitative relations to said variations.

34. The method of generating steam or vapor, which method consists in supplying a liquid to a suitable generator, heating the generator in such manner that only a small quantity of the liquid is maintained at the temperature or vaporization by variations in the condition of the fluid being heated, varying the supplies of both the liquid and the heat in substantial unison with the variations of demand for steam or vapor energy and in definite quantitative relations to said variations.

35. The method of generating steam or vapor, which method consists in supplying a liquid to a suitable generator, heating the generator in such manner that only a small quantity of the liquid is maintained at the temperature of vaporization by variations of the condition as to pressure of the fluid being heated, varying the supplies of both the liquid and the heat in substantial unison with the variations of demand for steam or vapor energy and in definite quantitative relations to said variations.

36. The method of generating steam or vapor, which method consists in supplying a liquid to a suitable generator, heating the generator in such manner that only a small quantity of the liquid is maintained at the temperature of vaporization, varying the supplies of both the liquid and the heat in such manner that the effective supplies of both vary in substantial unison with the variations in demand for steam or vapor energy and in substantially definite quantitative relations to said variations.

37. The method of generating steam or vapor, which method consists in supplying a liquid to a suitable generator, heating the generator in such manner that only a small quantity of the liquid is maintained at the temperature of vaporization, varying the supplies of both the liquid and the heat by variations in the condition of the fluid being heated in such manner that the effective supplies of both vary in substantial unison with the variations in demand for steam or vapor energy and in substantially definite quantitative relations to said variations.

38. The method of generating steam or vapor, which method consists in supplying a liquid to a suitable generator, heating the generator in such manner that only a small quantity of the liquid is maintained at the temperature of vaporization, varying the supplies of both the liquid and the heat by variations in the condition as to pressure of the fluid being heated in such manner that the effective supplies of both vary in substantial unison with the variations of demand for steam or vapor energy and in substantially definite quantitative relations to said variations.

39. The method of generating steam or vapor, which method consists in supplying a liquid to a suitable generator, heating the generator in such manner that only a small quantity of the liquid is maintained at the temperature of vaporization, varying the supplies of both the liquid and the heat in substantial unison with the variations of demand for steam or vapor energy and in substantially the same degree with said variations.

40. The method of generating steam or vapor, which method consists in supplying a liquid to a suitable generator, heating the generator in such manner that only a small quantity of the liquid is maintained at the temperature of vaporization by variations in the condition of the fluid being heated, varying the supplies of both the liquid and the heat in substantial unison with the variations of demand for steam or vapor energy and in substantially the same degree with said variations.

41. The method of generating steam or vapor, which method consists in supplying a liquid to a suitable generator at a substantially predetermined pressure, heating the generator in such manner that only a small portion of the liquid is maintained at the temperature of vaporization, and by variations in the condition as to pressure of the fluid being heated varying the supplies of both the liquid and the heat in substantial unison with the variations of demand for steam or vapor energy and in substantially the same degree with said variations of demand.

42. The method of generating steam or vapor and delivering the same in a substantially unvarying condition as to the energy thereof, which method consists in supplying a liquid to a suitable generator, heating the generator in such manner that only a small quantity of the liquid is maintained at the temperature of vaporization, and varying the supplies of both the liquid and the heat in such manner that the effective supplies of both vary in substantial unison with the variations of demand for steam or vapor energy and in substantially the same degree with said variations.

43. The method of generating steam or vapor and delivering the same in a substantially unvarying condition as to the energy thereof, which method consists in supplying a liquid to a suitable generator, heating the generator in such manner that only a small quantity of the liquid is maintained at the temperature of vaporization, and varying the supplies of both the liquid and the heat by variations in the condition of the fluid being heated in such manner that the effective supplies of both vary in substantial unison with the variations of demand for steam or vapor energy and in substantially the same degree with said variations.

44. The method of generating steam or vapor and delivering the same in substantially an unvarying condition as to temperature and pressure, said method consisting in supplying a liquid to a suitable generator at a substantially predetermined pressure, heating the generator in such manner that only a small quantity of the liquid is maintained at the temperature of vaporization, and varying the supplies of both the liquid and the heat by variations in the condition as to pressure of the fluid being heated in such manner that the effective supplies of both vary in substantial unison with the variations of demand for steam or vapor energy and in substantially the same degree with said variations of demand.

45. The method of generating steam or vapor, which method consists in supplying the liquid to a suitable generator, heating the generator in such manner that only a small quantity of the liquid is maintained at the temperature of vaporization, varying the supply of the liquid in substantial unison with the variations of demand for steam or vapor energy and in a substantially definite quantitative relation to said variations, and maintaining a predetermined quantitative relation between the supplies of the liquid and the heat.

46. The method of generating steam or vapor, which method consists in supplying a liquid to a suitable generator, heating the generator in such manner that only a small quantity of the liquid is maintained at the temperature of vaporization, varying the supply of the liquid by variations in the condition of the fluid being heated in such manner that the effective supply of the liquid varies in substantial unison with the variations of demand for steam or vapor energy and in a substantially predetermined quantitative relation to said variations of demand, and maintaining a predetermined quantitative relation between the supplies of the liquid and the fuel.

47. The method of generating steam or vapor, which method consists in supplying a liquid to a suitable generator, heating the generator in such manner that only a small quantity of the liquid is maintained at the temperature of vaporization, varying the supply of the liquid in substantial unison with the variations of demand for steam or vapor energy and in substantially the same degree with said variations, and maintaining a predetermined quantitative relation between the supplies of the liquid and the heat.

48. The method of generating steam or vapor, which method consists in supplying a liquid to a suitable generator, heating the generator in such manner that only a small quantity of the liquid is maintained at the temperature of vaporization, varying the supply of the liquid in substantial unison with the variations of demand for steam or vapor energy and in a substantially definite quantitative relation to said variations, and regulating the supply of heat by variations in the condition of the fluid being heated in such manner as to maintain a substantially predetermined quantitative relation between the supplies of the liquid and the heat.

49. The method of generating steam or vapor, which method consists in supplying a liquid to a suitable generator, heating the generator in such manner that only a small quantity of the liquid is maintained at the temperature of vaporization, varying the supply of the liquid in substantial unison with the variations of demand for steam or vapor energy and in a substantially definite quantitative relation to said variations, and regulating the supply of heat by the condition of the fluid flowing through the generator resulting from the flow of said fluid in such manner as to maintain a substantially predetermined quantitative relation between the flow of the fluid and the supply of heat.

50. The method of generating steam or vapor and delivering the same in a substantially unvarying condition as to the energy thereof, said method consisting in supplying a liquid to a suitable generator, heating the generator in such manner that only a small quantity of the liquid is maintained at the temperature of vaporization, varying the supply of liquid in substantial unison with the variations of demand for steam or vapor energy and in substantially the same degree with said variations, and regulating the supply of heat in such manner that the effective supply of heat varies in substantial unison with the variations of the flow of fluid through the generator and in substantially the same degree with said variations of flow.

51. The method of generating steam or vapor and delivering the same in a substantially unvarying condition as to the energy thereof, said method consisting in supplying a liquid to a suitable generator, heating the generator in such manner that only a small quantity of the liquid is maintained at the temperature of vaporization, varying the supply of the liquid by variations in the condition of the fluid being heated in such manner that the effective supply of the liquid varies in substantial unison with the variations of demand for steam or vapor energy and in substantially the same degree with said variations of demand, and regulating the supply of heat by the condition of the fluid flowing through the generator resulting from the flow of said fluid in such manner that the effective supply of the heat varies in substantial unison with the variations of the flow of fluid through the generator and in substantially the same degree with said variations of flow.

52. The method of generating steam or vapor and delivering the same in a substantially unvarying condition as to temperature and pressure, said method consisting in supplying a liquid to a suitable generator at a substantially predetermined pressure, heating the generator in such manner that only a small quantity of the liquid is maintained at the temperature of vaporization, varying the supply of the liquid by variations in the condition as to pressure of the fluid being heated in such manner that the effective supply of the liquid varies in substantial unison with the variations of demand for steam or vapor energy and in substantially the same degree with said variations of demand, and regulating the supply of heat by a condition of the fluid flowing through the generator resulting from the flow of said fluid in such manner that the effective supply of the heat varies in substantial unison with the variations of the flow of fluid through the generator and in substantially the same degree with said variations of flow.

53. The method of generating steam or vapor and delivering the same in a substantially unvarying condition, said method consisting in supplying a liquid to a suitable generator, heating the generator in such manner that only a small quantity of the liquid is maintained at the temperature of vaporization, varying the supply of the liquid in substantial unison with the variations of demand for steam or vapor energy and in a substantially definite quantitative relation to said variations, establishing a predetermined quantitative relation between the supplies of the liquid and the heat, and regulating the temperature of the steam or vapor by varying the relation between said supplies.

54. The method of generating steam or vapor and delivering the same at a substantially unvarying temperature, which method consists in supplying a liquid to a suitable generator, heating the generator in such manner that only a small quantity of the liquid is maintained at the temperature of vaporization, varying the effective supply of the liquid in substantial unison with the variations of demand for steam or vapor energy and in substantially the same degree with said variations, establishing a predetermined quantitative relation between the supplies of the liquid and the heat, and regulating the temperature of the steam or vapor by varying the relation between the said supplies.

55. The method of generating steam or vapor and delivering the same at a substantially unvarying temperature, said method consisting in supplying a liquid to a suitable generator, heating the generator in such manner that only a small quantity of the liquid is maintained at the temperature of vaporization, varying the supply of the liquid by variations in the condition of the fluid being heated in such manner that the effective supply of the liquid varies in substantial unison with the variations of demand for steam or vapor energy and in a substantially definite quantitative relation to said variations, regulating the supply of heat by variations in the condition of the fluid being heated in such manner as to maintain a substantially predetermined quantitative relation between the supplies of the liquid and the heat, and varying the relation between said supplies by variations in the temperature of the steam or vapor.

56. The method of generating steam or vapor and delivering the same at a substantially unvarying temperature and pressure, said method consisting in supplying a liquid to a suitable generator at a substantially predetermined pressure, heating the generator in such manner that only a small quantity of the liquid is maintained at the temperature of vaporization, varying the supply of the liquid by variations in the condition as to pressure of the fluid being heated in such manner that the effective supply of the liquid varies in substantial unison with the variations of demand for steam or vapor energy and in substantially the same degree with said variations of demand, regulating the supply of heat by variations in the condition of the fluid flowing through the generator resulting from variations in the flow of said fluid in such manner that the effective supply of the heat varies in substantial unison with the variations in the flow of the fluid through the generator and in substantially the same degree with said variations of flow.

57. The method of generating steam or vapor, which method consists in supplying a liquid to a suitable generator, supplying a fuel for heating the generator, varying the supplies of both the liquid and the fuel in substantial unison with the variations of demand for steam or vapor energy and substantially according to predetermined quantitative relations to said variations, and maintaining an auxiliary supply of fuel to replace the heat lost by radiation.

58. The method of generating steam or vapor and delivering the same at a substantially unvarying temperature, which method consists in supplying a liquid to a suitable generator, supplying a fuel for heating the generator, varying said supplies in such manner that the effective supplies of both the liquid and the fuel vary in substantial unison with the variations of demand for steam or vapor energy and in substantially the same degree with said variations, and maintaining an auxiliary supply of fuel to replace the heat lost by radiation.

59. The method of generating superheated steam, which method consists in supplying water to a suitable generator and gradually heating the water in such manner that only a small quantity of the water is maintained at the temperature of vaporization, and varying the supplies of both the water and the heat in substantial unison with the variations of demand for steam energy and substantially according to predetermined quantitative relations to said variations.

60. The method of generating superheated steam, which method consists in supplying water to a suitable generator, gradually heating the water in such manner that only a small quantity of the water is maintained at the temperature of vaporization, and varying the supplies of both the water and the heat in such manner that the effective supplies of both vary in substantial unison with the variations of demand for steam energy and substantially according to predetermined quantitative relations to said variations.

61. The method of generating superheated steam, which method consists in supplying water to a suitable generator, gradually heating the water in such manner that only a small quantity of the water is maintained at the temperature of vaporization, and varying the supply of both the water and the heat by variations in the condition of the fluid being heated in such manner that the effective supplies of both vary in substantial unison with the variations of demand for steam energy and substantially according to predetermined quantitative relations to said variations of demand.

62. The method of generating superheated steam, which method consists in supplying water to a suitable generator, gradually heating the water in such manner that only a small quantity of the water is maintained at the temperature of vaporization, and varying the supplies of both the water and the heat in substantial unison with the variations of demand for steam energy and in substantially the same degree with said variations.

63. The method of generating superheated steam and delivering the same in a substantially unvarying condition as to the energy thereof, said method consisting in supplying water to a suitable generator, gradually heating the water in such manner that only a small quantity of the water is maintained at the temperature of vaporization, and varying the supplies of both the water and the heat in such manner that the effective supplies of both vary in substantial unison with the variations of demand for steam or vapor energy and in substantially the same degree with said variations.

64. The method of generating superheated steam and delivering the same in a substantially unvarying condition as to the energy thereof, said method consisting in supplying water to a suitable generator, gradually heating the water in such manner that only a small quantity of the water is maintained at the temperature of vaporization, and varying the supplies of both the water and the heat by variations in the condition of the fluid being heated in such manner that the effective supplies of both vary in substantial unison with the variations of demand for steam or vapor energy and in substantially the same degree with the said variations of demand.

65. The method of generating superheated steam, which method consists in supplying water to a suitable generator, gradually heating the water in such manner that only a small quantity of the water is maintained at the temperature of vaporization, varying the supply of water in substantial unison with the variations of demand for steam energy and substantially according to a predetermined quantitative relation to said variations, and maintaining a substantially predetermined quantitative relation between the supplies of the water and the heat.

66. The method of generating superheated steam and delivering the same in a substantially unvarying condition as to the energy thereof, said method consisting in supplying water to a suitable generator, gradually heating the water in such manner that only a small quantity of the water

is maintained at the temperature of vaporization, varying the supply of the water by variations in the condition of the fluid being heated in such manner that the effective supply of the water varies in substantial unison with the variations of demand for steam energy and in substantially the same degree with said variations of demand, and maintaining a substantially predetermined quantitative relation between the supplies of the water and the heat.

67. The method of generating superheated steam and delivering the same at a substantially unvarying temperature, said method consisting in supplying water to a suitable generator, gradually heating the water in such manner that only a small quantity of the water is maintained at the temperature of vaporization, varying the supply of water by variations in the condition of the fluid being heated in such manner that the effective supply of water varies in substantial unison with the variations of demand for steam energy and substantially according to a predetermined quantitative relation to said variations of demand, establishing a predetermined quantitative relation between the supplies of the water and the heat, and regulating the temperature of the steam by varying the relation between said supplies.

68. The method of generating superheated steam, which method consists in supplying water to a suitable generator, gradually heating the water in such manner that only a small quantity of the water is maintained at the temperature of vaporization, varying the supply of water by variations in the condition of the fluid being heated in such manner that the effective supply of water varies in substantial unison with the variations of demand for steam energy and substantially according to a predetermined quantitative relation to said variations of demand, regulating the supply of heat by variations in the condition of the fluid flowing through the generator resulting from variations in the flow of said fluid in such manner that the effective supply of heat varies in substantial unison with the variations in the flow of fluid through the generator and substantially according to a predetermined quantitative relation to said variations of flow.

69. The method of generating superheated steam, which method consists in supplying water to a suitable generator, supplying a fluid fuel for heating the generator, and varying the supplies of both the water and the fuel in substantial unison with the variations of demand for steam energy and substantially according to predetermined quantitative relations to said variations.

70. The method of generating superheated steam, which method consists in supplying water to a suitable generator, supplying a fluid fuel for heating the generator, and varying said supplies in such manner that the effective supplies of both the water and the fuel vary in substantial unison with the variations of demand for steam energy and substantially according to predetermined quantitative relation to said variations.

71. The method of generating superheated steam, which method consists in supplying water to a suitable generator, supplying a fluid fuel for heating the generator, and varying said supplies by variations in the condition of the fluid being heated in such manner that the effective supplies of both the water and the fuel vary in substantial unison with the variations of demand for steam energy and substantially according to definite quantitative relations to said variations of demand.

72. The method of generating superheated steam, which method consists in supplying water to a suitable generator, supplying a fluid fuel for heating the generator, varying the supply of the water in substantial unison with the variations of demand for steam energy and substantially according to a predetermined quantitative relation to said variations, and maintaining a substantially predetermined quantitative relation between the supplies of the water and the fuel.

73. The method of generating superheated steam, which method consists in supplying water to a suitable generator, supplying a fluid fuel for heating the generator, varying the supply of the water by variations in the condition of the fluid being heated in such manner that the effective supply of the water varies in substantial unison with the variations of demand for steam energy and substantially according to a predetermined quantitative relation to said variations of demand, and maintaining a substantially predetermined quantitative relation between the supplies of the water and the fuel.

74. The method of generating superheated steam, which method consists in supplying water to a suitable generator, supplying a fluid fuel for heating the generator, varying the supply of the water by variations in the condition of the fluid being heated in such manner that the effective supply of the water varies in substantial unison with the variations of demand for steam energy and substantially according to a predetermined quantitative relation to said variations and regulating the flow of the fuel by variations in the condition of the fluid flowing through the generator resulting from variations in the flow of said fluid in such manner as to maintain a substantially predetermined quantitative relation between the flow of the fluid through the generator and the flow of the fuel.

75. The method of superheating steam or vapor, which method consists in supplying steam or vapor to a suitable superheater, supplying a heating agent for heating said superheater, and varying the supplies of both the steam or vapor and the heating agent in substantial unison with the variations of demand for steam energy and substantially according to predetermined quantitative relations to said variations.

76. The method of superheating steam or vapor, which method consists in supplying steam or vapor to a suitable superheater, supplying the heating agent for heating said superheater, and varying said supplies in such manner that the effective supplies of both the steam or vapor and the heating agent vary in substantial unison with the variations of demand for steam energy and in substantially definite quantitative relations to said variations.

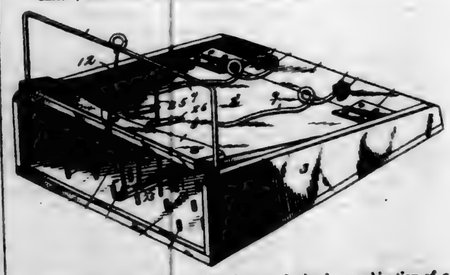
77. The method of superheating steam or vapor and delivering the same at a substantially unvarying temperature, said method consisting in supplying steam or vapor to a suitable superheater, supplying a heating agent for heating said superheater, and varying said supplies in such manner that the effective supplies of both the steam or vapor and the heating agent vary in substantial unison with the variations of demand for steam energy and in substantially the same degree with said variations.

78. The method of superheating steam or vapor, which method consists in supplying steam or vapor to a suitable superheater, supplying the heating agent for heating said superheater, varying the supplies of both the steam or vapor and the heating agent in substantial unison with the variations of demand for steam energy and in substantially definite quantitative relations to said variations, and varying the effective heating-surface of said superheater inversely and in substantial unison with the variations of demand for steam energy.

704,909. PIPE-COUPLING. JOSEPH W. S. HYDE, Pittsburg, Pa. Filed Nov. 2, 1901. Serial No. 80,949. (No model.)

Claim.—In a pipe-coupling, the combination with the flared ends of the pipe-sections having a space therebetween, of a double-cone connecting member having an annular flange with a flat periphery provided on each side with an inwardly-extending groove forming a knife-edge at the upper face of said flange, said knife-edges engaging into the pipe-sections, said cone member being tapered from said flange and carrying a portion at each end of equal diameter throughout, said portion adapted to spread the ends of the pipe-sections, a sleeve mounted on one pipe-section and provided with an annular flange, a sleeve mounted on the opposite pipe-section and provided with an annular threaded flange, said annular flanges having a space therebetween adapted to be occupied by the lead cut by the said knife-edge of the connecting member, a ring-nut having its threads engaging with said threaded flange, a flange carried by said ring-nut for engagement with said first-named sleeve-flange, substantially as described.

704,910. RAT-TRAP. PETER OLAFFSEN, Tacoma, Wash. Filed Mar. 7, 1902. Serial No. 97,101. (No model.)



Claim.—1. In a trap of the class set forth, the combination of a body with closed sides and rear end, the sides being highest at the front, a spring-actuated trap-cover movably attached at its rear end to a portion of the main body of the trap, the bottom of the body and lower side of the cover having impaling-spurs projecting therefrom, a loosely-mounted bait-holding device, and a trip-rod to engage the bait-holding device and cover to set the trap.

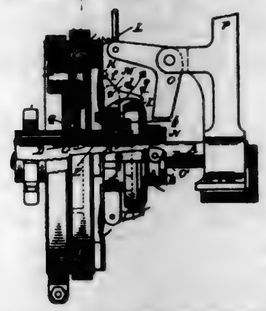
2. In a trap of the class set forth, the combination of a body, a trap-cover cooperating therewith, a bait-holding device loosely connected at its rear end solely, and having a bait-holding pocket with a slide, and a projection at its free end, a rigid bail rising from the body above the trap-cover, and a trip-rod flexibly suspended from the bail and adapted to engage the cover and bait-holding device.

3. In a trap of the class set forth, the combination of a body, a trap-cover movably attached thereto, a bait-holding device extending longitudinally through the central portion of the body above the bottom of the latter, a centering loop for maintaining the bait-holding device in proper position, and a flexibly-suspended trip-rod adapted to engage the bait-holding device and trap-cover.

4. A holding device for a trap consisting of an elongated arm flexibly connected at its rear end and having a central enlargement with a pocket therein, and a slide to close the pocket and having an opening therethrough.

5. In a trap of the class set forth, the combination of a body having a spring-actuated trap-cover attached thereto and adapted to normally close downwardly thereover, a bait-holding device, and a flexibly-suspended trip-rod for interposition between the front end of the bait-holding device and the lid or cover.

704,911. FRICTION-CLUTCH. RASMUS R. OLSE, Detroit, Mich. Filed Feb. 25, 1902. Serial No. 96,612. (No model.)



Claim.—1. In a transmission-gearing, the combination with a drive-shaft, of a head loose upon said shaft, a head secured to rotate with said shaft upon one side of said loose head, a spring-arm secured to the latter head having a friction-block at its outer end in close proximity to the face of said loose head and means for pressing against said spring-arm to yieldingly press said block in frictional contact with said loose head.

2. In a transmission-gearing, the combination with a drive-shaft, of a head loose upon said shaft, a head fixed upon said shaft beside said loose head, a plurality of radial arms secured to said fixed head flexible laterally but rigid in the plane of rotation, friction-blocks at the outer ends of said arms in close proximity to said loose head, dogs secured to said fixed head for bearing against said spring-arms and having operating-arms projecting laterally, and a cam-head longitudinally movable upon said shaft adapted to spread said operating-arms and cause said dogs to press against said flexible radial arms thereby pressing said blocks into frictional contact with said head.

3. In a transmission-gearing, the combination of the drive-shaft, a head loose on the shaft, a head fixed on the shaft beside the loose head, spring-arms secured to the latter head and adapted to bear against the loose head, dogs on the fixed head for flexing the springs and means for actuating said dogs.

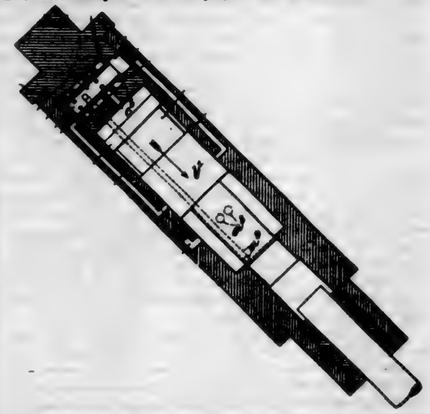
4. In a transmission-gearing, the combination of the drive-shaft, a head loose on the shaft, a head fixed on the shaft beside the loose head, spring-arms secured to the latter, adapted to be pressed against the loose head by flexing the spring-arms, means for flexing the spring-arms, and for automatically locking said flexing means against accidental movement.

5. In a transmission-gearing, the combination of the drive-shaft, a head loose on the shaft, a head fixed on the shaft beside the loose head, spring-arms secured to the latter adapted to be pressed against the loose head by flexing the spring-arms, bell-crank levers for flexing the spring-arms, one arm thereof adapted to bear against the springs, a cam-head movable on the shaft for engagement with the other arm thereof, and a curved bearing on said arm with which the actuating-cam engages.

704,912. PNEUMATIC IMPACT-TOOL. SAMUEL GLIDDAN, Philadelphia, Pa. Filed Nov. 4, 1901. Serial No. 80,966. (No model.)

Claim.—1. In a pneumatic impact-tool, a cylinder, a piston or hammer adapted to reciprocate in said cylinder, a housing adapted to close

said cylinder at one end thereof, a chamber arranged in said housing transversely to said cylinder, a valve adapted to reciprocate in the chamber of said housing, means adapted to conduct live air or fluid to the interior of said valve, and means controlled by the movement of the piston for admitting live air or fluid to the valve-chamber in rear of said valve substantially as and for the purposes described.



2. In a pneumatic impact-tool, a cylinder, a piston or hammer adapted to reciprocate in said cylinder, a housing adapted to close the upper end of said cylinder, a chamber arranged in said housing transversely of said cylinder, a hollow valve open at one end and adapted to reciprocate in said chamber, and means adapted to conduct live air or fluid directly and constantly into the interior of said valve and indirectly in rear of said valve, substantially as and for the purposes described.

3. In a pneumatic impact-tool, a cylinder, a piston or hammer adapted to reciprocate in a portion of said cylinder, a housing adapted to fill the upper portion of said cylinder to close the same at its upper end, a chamber arranged in said housing transversely of said cylinder, a tubular valve closed at one end and adapted to reciprocate in said chamber in a plane transversely to the reciprocation of said hammer or piston, means adapted to conduct live air or fluid into the valve to act constantly upon the interior of the closed end thereof, and means controlled by the piston or hammer adapted to alternately admit live air or fluid into said valve-chamber and to the rear of said valve, and to exhaust said live air from said chamber, substantially as and for the purposes described.

4. In a pneumatic impact-tool, a cylinder, a piston or hammer adapted to reciprocate in said cylinder, a housing adapted to close the upper end of said cylinder, a chamber arranged in said housing transversely of said cylinder, a hollow valve closed at one end and adapted to reciprocate in said chamber, an inlet port or conduit for live air or fluid arranged opposite said chamber and valve in said cylinder, ports or conduits leading from said inlet-port into said chamber to conduct live air or fluid thereto and an exhaust port or conduit of relatively large area connecting said valve-chamber with the open air, said ports connecting the valve-chamber with the live-air inlet being controlled directly by the piston or hammer independently of the valve in said chamber, substantially as and for the purposes described.

5. In a pneumatic impact-tool, a cylinder, a piston or hammer having a range of movement therein, a housing closing one end of said cylinder, a chamber arranged in said housing, a hollow valve closed at one end and located within the chamber of said housing, means adapted to move said valve slowly in one and quickly in the other direction, said means comprising a main inlet-port for live air or fluid centrally arranged opposite the open end of said hollow valve and conducting live air or fluid into the interior of said valve to act constantly upon the small head thereof, a branch inlet-port of small area leading from said main inlet-port and adapted to conduct live air or fluid into said chamber in rear end in front of the large head of said valve, and exhaust-ports of large area connecting said chamber with the atmosphere to permit of rapid discharge of live air or fluid from said chamber, substantially as and for the purposes described.

6. In a pneumatic impact-tool, a cylinder wherein the hammer or piston is adapted to reciprocate, a housing wherein a valve is adapted to reciprocate transversely to the reciprocation of said piston or hammer, said valve consisting of a hollow cylinder closed at one end and adapted to reciprocate in said housing, chambers arranged on the exterior of said valve, openings arranged in the body of said valve and adapted to communicate with the chambers located on the exterior of said valve, the

closed head of said valve and chambers controlling the actuation of the hammer or piston and the piston or hammer in conjunction with the closed end of the valve controlling the operation of said valve, substantially as and for the purposes described.

7. The combination, in a pneumatic impact-tool, of a cylinder, a piston reciprocable therein, a housing fixed in the upper end of said cylinder, a chamber arranged in said housing, passages for the motive fluid at the front and rear of said chamber, inlet and exhaust passages from each end of said cylinder and terminating and leading from said chamber, a valve having a range of movement within said housing, said piston adapted to permit of the entrance of live air or fluid in rear of said valve to cause the air or fluid to act on different areas of said valve at the same time, to retard the movement of said valve, and said valve adapted to centrally receive the motive fluid or air and to distribute the same from its center radially, substantially as and for the purposes described.

8. A pneumatic impact tool or hammer, comprising a cylinder, a piston reciprocable therein, a hollow valve, a valve-housing adapted to close the cylinder at its upper end, motive-fluid inlets opposite said hollow valve at either end of said housing in said cylinder and arranged at right angles to said valve, admission and exhaust ports and passages intermediate of said inlets in said housing, annular chambers in the exterior of said valve, openings in the body of said valve, a centrally-arranged chamber in the interior of said valve and said openings connecting said interior chamber with certain of the annular chambers of said valve, substantially as and for the purposes described.

9. In a pneumatic impact-tool, a cylinder, a piston or hammer adapted to reciprocate therein, a housing adapted to close the upper end of said cylinder, a hollow valve closed at one end and having a range of movement within said housing and with a centrally-arranged chamber in the interior and annular chambers in the exterior thereof, said valve-housing having two combined admission and exhaust ports and one exhaust-port, the said annular chambers adapted to be brought alternately into alinement with one of said admission and exhaust ports and the intermediate annular chamber adapted to constantly communicate with said exhaust-port and one of said combined admission and exhaust ports to move said piston or hammer slowly in one direction and quickly in the other direction, substantially as and for the purposes described.

10. The combination, in a pneumatic impact tool or hammer, of a cylinder, a piston reciprocable therein, a housing adapted to close said cylinder at one end thereof, a chamber arranged in said housing, a handle, a tubular extension of said handle adapted to engage the upper end of said cylinder, a shoulder arranged on said cylinder and having teeth on its entire periphery, a spring-controlled bolt arranged in the tubular extension of said handle and adapted to engage the teeth of said shoulder to lock and to prevent the disconnecting of said handle from said cylinder and to compensate for wear between said cylinder and handle.

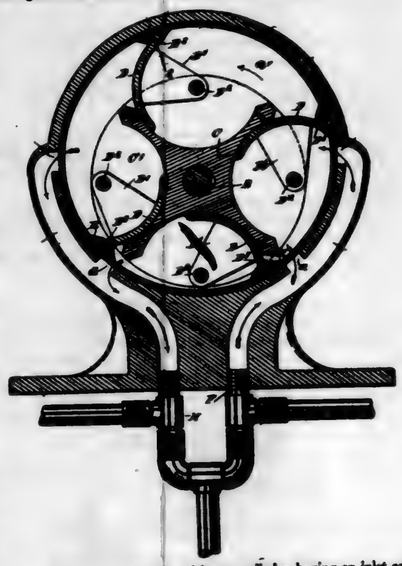
704,913. ROTARY ENGINE. FREDERICK A. PALLS, New York, N. Y. Filed Jan. 11, 1902. Serial No. 89,262. (No model.)

Claim.—1. A rotary engine, comprising a cylinder, a piston eccentric therein and having recesses in its peripheral surface, the inner walls of the recesses being segmental, piston-heads having a segmental shape and mounted to swing in the said recesses and in sliding contact with the inner peripheral wall thereof, the said piston-heads having a sliding and interlocking engagement with the cylinder, as set forth.

2. A rotary engine comprising a cylinder having an inlet and an exhaust, a piston mounted to turn eccentrically in the said cylinder and having segmental recesses in its periphery, piston-heads mounted to swing on the said piston and in sliding contact with the peripheral wall of the recessed portions, and blocks mounted to slide in the cylinder and having a hinged connection with the said piston-heads, each of the blocks having its ends projecting into annular grooves formed in the cylinder-heads, as set forth.

3. A rotary engine comprising a cylinder, a piston mounted to turn concentrically in the said cylinder, and having cut-out portions in its peripheral surface, the inner walls of the cut-out portions being segmental, piston-heads having a segmental shape and mounted to swing in the cut-out portions and in sliding contact with the peripheral inner wall of the cut-out portions, each piston-head having side arms fulcrumed on the sides of the piston, and blocks mounted to slide on the inside of the rim of the cylinder, each block having a hinged connection with a corresponding piston-head, as set forth.

4. A rotary engine comprising a cylinder, a piston mounted to turn concentrically in the said cylinder, and having cut-out portions in its peripheral surface, the inner walls of the cut-out portions being segmental, piston-heads having a segmental shape and mounted to swing in the cut-out portions and in sliding contact with the peripheral inner wall of the cut-out portions, each piston-head having side arms fulcrumed on the sides of the piston, blocks mounted to slide on the inside of the rim of the cylinder, each block having a hinged connection with a corresponding piston-head, and means for controlling the inlet and exhaust of the motive agent to either side of the cylinder, as set forth.



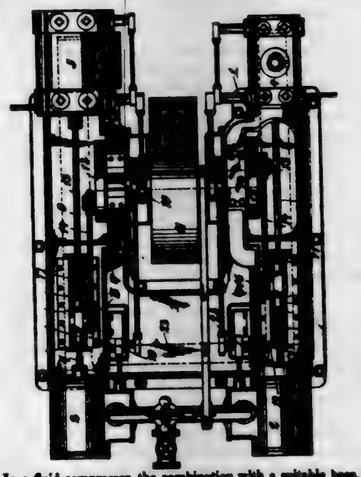
5. A rotary engine comprising a cylinder having an inlet and an exhaust, a piston eccentric in the cylinder, and having cut-out portions in its peripheral surface, the inner walls of the cut-out portions being segmental, piston-heads having a segmental shape and mounted to swing in the cut-out portions and in sliding contact with the peripheral inner wall of the cut-out portions, each piston-head having side arms fulcrumed on the sides of the piston near the periphery thereof and at the center of the cut-out portions, the piston-heads having a sliding connection with the cylinder, and blocks mounted to slide in the cylinder and having a hinged connection with the piston-heads, as set forth.

6. A rotary engine, comprising a cylinder, a piston mounted to turn eccentrically in the said cylinder, and having recesses in its peripheral surface, the inner walls of the recesses being segmental, piston-heads having a segmental shape and mounted to swing in the recesses of the piston and in sliding engagement with the peripheral inner wall of the recesses, each piston-head having side arms fulcrumed on the sides of the piston near the periphery thereof and at the center of the recesses, blocks mounted to slide on the inside of the rim of the cylinder, each block having a hinged connection with a corresponding piston-head, the said cylinder being provided with ports in its rim at opposite sides thereof, and channels leading from said ports, a pipe leading from each of said channels and connected with a supply-pipe, the said pipes being each provided with a valve, and exhaust-pipes each connected with one of the said pipes at a point between the valve and the connection of the pipe with the channel, the said exhaust-pipes being each provided with a valve, as set forth.

704,914. COMPRESSOR. FREDERICK W. PARSONS, Hooks, N. Y., assignor to Rand Drill Company, New York, N. Y., a Corporation of New York. Filed Apr. 16, 1901. Serial No. 56,108. (No model.)

Claim.—1. In a fluid-compressor, the combination with two power-cylinders arranged side by side, two compression-cylinders also arranged side by side, and each in line with one of the power cylinders, pistons for said cylinders, piston-rods connecting the pistons in opposite cylinders, and a sliding cross-head for each of said piston-rods, located between the corresponding cylinders, and each provided with an inwardly-projecting wrist-pin, of a cross-head guide for each of said cross-heads, having upper, side and lower bearing portions coacting with corresponding portions of the cross-head, whereby lateral strain upon the cross-head, in every direction, is resisted, a transverse crank-shaft intermediate of said cylinders, a fly-wheel thereon, and a connecting-rod connecting each said wrist-pin with said crank-shaft, said connecting-rods each arranged eccentrically of the axis of its corresponding pistons and piston-rod, and to have a path of movement to one side of the path of movement of the said piston-rod.

2. In a fluid-compressor, the combination with a suitable base, of a power-cylinder and a compression-cylinder arranged axially in line with each other, pistons within said cylinders, piston-rods connected to said pistons, a cross-head to which both said piston-rods are connected, said cross-head having a longitudinally-grooved shoe adapted to slide over a corresponding surface in a cross-head guide, of a cross-head guide comprising a longitudinally-tongued slipper adapted to receive the said cross-head shoe, and retaining-plates adapted to retain the said cross-head shoe in place; the said cross-head having a wrist-pin extending laterally upon one side thereof, and adapted to receive one end of a pitman or connecting-rod.



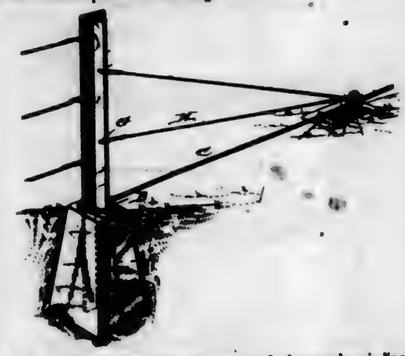
3. In a fluid-compressor, the combination with a suitable base, of a power-cylinder and a compression-cylinder arranged axially in line with each other, pistons within said cylinders, piston-rods connected to said pistons, a cross-head having a longitudinally-grooved shoe adapted to slide over a corresponding surface in a cross-head guide, of a cross-head guide comprising a guide-block secured to the base, a removable slipper supported thereon, and held in place thereby, said slipper longitudinally tongued and adapted to receive the said cross-head, and retaining-plates to retain the said cross-head shoe in place; the said cross-head having a wrist-pin extending laterally upon one side thereof, and adapted to receive one end of a pitman or connecting-rod.

4. In a fluid-compressor, the combination with two power-cylinders arranged side by side, two compression-cylinders also arranged side by side, and each in line with one of the said power-cylinders, pistons arranged in said cylinders, piston-rods connecting the pistons in opposite cylinders, cross-heads connected to said piston-rods, and a wrist-pin, for each cross-head, laterally projecting from the inner side thereof, said cross-heads having each a longitudinally-grooved shoe adapted to slide over a corresponding surface in a cross-head guide, of cross-head guides each comprising a longitudinally-tongued slipper adapted to receive one of the said cross-head shoes, and retaining-plates adapted to retain the said cross-head shoe in plain, a transverse shaft mounted intermediate of all of said cylinders, and in the plane of the piston-rods, and provided with crank-pins, a fly-wheel upon said shaft, and two connecting-rods, connecting said crank-pins and wrist-pins.

5. In a fluid-compressor, the combination with two power-cylinders arranged side by side, two compression-cylinders also arranged side by side, and each in line with one of the power-cylinders, pistons for said cylinders, sectional piston-rods connecting the pistons in opposite cylinders, one section of each such piston-rods being connected to one of said pistons, and the sections of said piston-rods being separable from each other, and a cross-head for each such piston-rod, located between the corresponding cylinders, and each provided with an inwardly-projecting wrist-pin, of a cross-head guide for each of said cross-heads having means for resisting lateral strain upon the cross-head, a transverse crank-shaft, intermediate of said cylinders, a fly-wheel thereon, and a connecting-rod connecting each said wrist-pin with said crank-shaft, said connecting-rods each arranged eccentrically of the axis of its corresponding pistons and piston-rod, and to have a path of movement to one side of the path of movement of the said piston-rod.

704,915. FENCE-POST. CHARLES O. PEAK, Jacksonville, Ill. Filed June 2, 1900. Serial No. 18,578. (No model.)

Claim.—1. The combination with a fence-post, of a rod having a loop at one end encircling the lower portion of said post and its opposite end threaded, a plate having a vertical flange the upper end of which is deflected outwardly, said vertical flange being perforated to receive said threaded end, a guide-eye located in advance of the said plate and embracing the said rod, nuts on the threaded end of the said rod on opposite sides of said flange, and a tie-wire connected to the post and also to the deflected portion of said flange.



2. The combination with a fence-post, of a brace-rod encircling the lower portion of said post and having its opposite end threaded, and passing through a stationary guide-eye located in advance of said threaded portion, a brace-plate formed with a vertical flange and adjustably secured to said brace-rod, nuts on the threaded end of said rod and disposed on opposite sides of said flange and a deflected portion on said flange perforated to receive tie-wires, said wires extending at right angles from the said deflected portion and connected to the post.

3. The combination with a fence-post, of a brace-rod, the inner end of which encircles the lower portion of said post and having its opposite end threaded, an anchor-block arranged at a suitable distance from the post, a brace-plate formed with a vertical flange, said brace-plate adjustably secured to the brace-rod and adapted to rest on said anchor-block, a guide-eye rigidly secured to the anchor-block and adapted to embrace the outer end of the brace-rod, nuts on the threaded end and disposed on opposite sides of the said flange, said flange and deflected portion thereof having perforations adapted to receive respectively the brace-rod and tie-wires, said wires being connected to the post and arranged to pull at right angles to the deflected portion.

704,916. CALENDAR-CLOCK. JOHN I. PRATHER, Arlington, Mass. Filed May 3, 1901. Serial No. 58,005. (No model.)

Claim.—1. In a calendar, devices for indicating date, day and month divisions of a year, means for causing the movements of said devices, and a device having an axial and transverse rotary motion for governing the date changes, substantially as specified.

2. In a calendar, a motor, a rotary part for indicating dates operated by said motor, a wheel having an axial rotary motion and a transverse rotary motion, the said wheel being operated from the motor in its transverse rotation, lugs or projections on the opposite sides of said wheel, the said wheel having segmental slots in its periphery, bridges in the periphery opposite sundry of the projections of lugs, and means operated by the transverse rotary motion of said wheel for causing its axial rotary motion, substantially as specified.

3. In a calendar, a rotary part for indicating dates, a counter-shaft at the front of the machine, a motor for the counter-shaft, a driving connection between said counter-shaft and the rotary part, a day-cylinder, a ratchet-wheel on the shaft of said cylinder, a pawl engaging with said ratchet, a rod extended downward from the pawl, a cam on the shaft for engaging with said rod, and a locking device for the cylinder and moved to its releasing position by said shaft, substantially as specified.

4. In a calendar, a rotary part for indicating dates, a shaft having driving connection with said rotary part, a motor for operating the shaft, a day-cylinder, a ratchet-wheel on the shaft of said cylinder, an arm mounted to swing on said shaft, a pawl carried by the arm for engaging with the ratchet-wheel, a rod extended downward from the arm, a cam on the shaft for engaging with said rod, a stop or locking-wheel on the shaft of the cylinder, having notches in its periphery, a locking-dog for engaging in the notches, and a projection on the shaft for moving said dog to its releasing position, substantially as specified.

5. In a calendar, a rotary part for indicating dates, a motor for op-

erating said rotary part, a day-cylinder, a ratchet-wheel on the shaft of said cylinder, an arm mounted to swing on the shaft, a pawl carried by said arm for engaging the ratchet-wheel, means operated by the motor for causing the movements of said arm and pawl, a stop or locking disk on the shaft of the cylinder and having notches, the said disk being of larger diameter than the ratchet-wheel, and a stop or locking device for engaging in the notches of said disk and operated in one direction by the motor, substantially as specified.

6. In a calendar, a rotary part for indicating dates, a motor for imparting motion to said part, a day-cylinder, a month-cylinder, means operated by the motor for causing movements of the cylinders, means for preventing movement of the month-cylinder during certain movements of the day-cylinder and a part having a transverse and axial rotation for controlling the motor, substantially as specified.

7. In a calendar, a rotary part for indicating dates, a counter-shaft, a motor for operating said counter-shaft, a wheel having a transverse and an axial rotary motion for controlling the motor, a driving connection between said counter-shaft and said rotary part, a day-cylinder, a month-cylinder, a cam carried by the shaft for operating the day-cylinder, a cam carried by the shaft for operating the month-cylinder, and means operated by the shaft for preventing a movement of the month-cylinder during certain movements of the day-cylinder, substantially as specified.

8. In a calendar, a motor, a counter-shaft operated by said motor, a day-cylinder, means operated by the counter-shaft for imparting a step-by-step rotary motion to said cylinder, a month-cylinder, a ratchet-wheel on the shaft of said month-cylinder, a swinging arm on said shaft, a pawl carried by the arm for engaging with the ratchet-wheel, a rod extended downward from the arm, a cam on the shaft for engaging with said rod, a disk having an outwardly-opening notch, a gear connection between the shaft and said disk, a swinging arm or rod having connection with the rod extended from the arm, and a finger on said arm or rod for engaging on the periphery of the disk and adapted to drop into the notch thereof, substantially as specified.

9. In a calendar, a motor, a rotary part operated by the motor for indicating dates, rotary parts for indicating days and months and operated by the motor, a four-year wheel having an axial rotary motion and a transverse rotary motion, means for imparting said motions, a swinging rod, a hammer on the end of said rod for engaging with the four-year wheel, and means operated by an upward movement of said swinging rod for releasing the motor, substantially as specified.

10. In a calendar, a motor, a dial, a hand or pointer movable over said dial, a shaft on which the hand or pointer is mounted, a ratchet-wheel on said shaft, an arm mounted to swing on the shaft, a pawl carried by the arm for engaging with the ratchet-wheel, a draw-rod extended from the arm, a cam operated by the motor for moving said draw-rod upward, a stop-wheel on the shaft and having notches in its periphery, and a holding-bar for engaging in said notches, the said holding-bar being moved to its releasing position by a movement of the motor, substantially as specified.

11. In a calendar, a rotary part for indicating dates, a motor for causing movements of said rotary part, a frame to which rotary motion is imparted from the motor, a four-year wheel mounted to rotate axially in said frame, a fixed rack or gear, a worm-shaft, a pinion on said worm-shaft engaging with said fixed rack or gear, a worm on the shaft, said worm having a straight or inoperative portion, and teeth on the four-year wheel for engaging with said worm, substantially as specified.

12. In a calendar, a rotary part for indicating dates, a motor for imparting motion thereto, and a four-year wheel for governing the motions of said rotary part, the said four-year wheel having an axial rotary motion and a transverse rotary motion, the said wheel having segmental slots or channels in its periphery, bridge-blocks in the periphery of the wheel, a series of lugs extended outward from one face of the wheel at its periphery, and three lugs extended from the opposite face of the four-year wheel near its periphery, substantially as specified.

13. In a calendar, a train of driving-wheels, a spring for operating said wheels, a rock-shaft, a stop-arm extended from said rock-shaft, a pin on one of the train-wheels for engaging with said stop-rod, another rock-shaft, two arms or rods extended from said other rock-shaft, one adapted to engage with the stop arm or rod, and the other being adapted to be moved into line of movement of a pin on another of the driving train-wheels, means having connection with a clock mechanism for moving the last-named rock-shaft, a date-indicator operated by the train of gearing, a hammer carried by the first-named rock-shaft, and a four-year wheel adapted to be engaged by the hammer, the said four-year wheel having an axial rotary motion and a transverse rotary motion, substantially as specified.

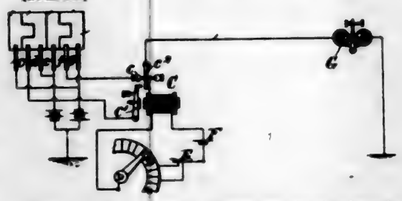
14. In a calendar, a motor, a day-cylinder, a counter-shaft operated by the motor, means actuated by the counter-shaft for imparting motion to the cylinder, a rock-shaft having connection with said means, a curved arm extended from said rock-shaft, a curved cam or finger adapted to be engaged by said arm, a pinion on the shaft of said cam, a segmental rack engaging with the said pinion, and means for operating said segmental rack, substantially as specified.

15. In a calendar, a rotary part for indicating dates, a motor, a counter-shaft having driving connection with said motor, a shaft for moving the rotary part and operated from the motor, a worm-wheel shaft, a worm-wheel on said shaft, a worm on the first-named shaft for engaging with the worm-wheel, a frame carried by said worm-wheel shaft, a four-year wheel mounted to rotate in said frame, a fixed gear, a shaft having bearings in said frame, a pinion on the shaft and engaging with the fixed gear, a worm on said shaft, forty-eight teeth extended from one face of the wheel for engaging with said worm, and devices carried by the wheel for controlling the movements of said rotary part, substantially as specified.

16. In a calendar, a motor, a wheel having a transverse and axial motion for governing the motor, a counter-shaft operated by said motor, a day-cylinder arranged above the motor, a month-cylinder arranged above the motor, means operated from one end of the counter-shaft for imparting motion to the day-cylinder, means operated from the opposite end of said shaft for moving the month-cylinder, and means operated by the shaft for preventing movements of the month-cylinder until the change is made from one month to another, substantially as specified.

17. In a calendar, a motor, a date-indicating device operated by said motor, a four-year wheel having axial and transverse movements for controlling movements of said date-indicating device, a hammer for engaging with said wheel, a rock-shaft by which the hammer is carried, an arm extended from said rock-shaft, and a cam operated by the motor for causing vertical movements of said arm, substantially as specified.

704,917. TRANSMITTING APPARATUS FOR ELECTRIC TELEGRAPHS. THOMAS D. PENNIMAN and HENRY H. WIBBARD, Baltimore, Md., assignors to the Rowland Telegraphic Company, Baltimore, Md., a Corporation of New Jersey. Filed Feb. 18, 1902. Serial No. 94,681. (No model.)



Claim.—1. In transmitting apparatus for electric telegraphs, the combination with a source of direct current, of a telegraph-line, a pole-changer connected in circuit with said line and source of current, the said pole-changer having terminals arranged in sets and acting normally to deliver to line through one set, a periodic current from said source, and a main-line transmitter adapted to shift the line connection from one set of said terminals to another, whereby an impulse of opposite polarity is sent to line than would have been sent had not the transmitter acted.

2. In transmitting apparatus for electric telegraphs, the combination with a source of electric current, of a telegraph-line, a pole-changer connected in circuit with said line and source of current, the said pole-changer having terminals arranged in sets and acting to normally transmit to line from said source electric impulses of alternate polarity, and means adapted to shift the line connection from one set of said terminals to another whereby an impulse of opposite polarity is sent to line than would have passed had the connection not been shifted.

3. In transmitting apparatus for electric telegraphs, the combination with a source of direct current, of a telegraph-line, a rotating pole-changer connected in circuit with said line and source of current, the said pole-changer having brushes arranged in sets and acting normally to deliver to line, through one set, a periodic current from said source, and a main-line transmitter adapted to shift the line connection from one set of said brushes to another, whereby an impulse of opposite polarity is sent to line than would have been sent had not the transmitter acted.

4. In transmitting apparatus for electric telegraphs, the combination with a source of electric current, of a telegraph-line, a rotating pole-changer connected in circuit with said line and source of current, the said pole-changer having brushes arranged in sets and acting to normally transmit to line from said source electric impulses of alternate polarity, and an electromagnetically-operated main-line transmitter adapted to shift the line connection from one set of said brushes to another whereby an impulse of opposite polarity is sent to line than would have passed had the connection not been shifted.

5. In transmitting apparatus for electric telegraphs, the combination with a main-line transmitter, having a contact-stop, a tongue normally in engagement with said stop, a striker adapted to engage said tongue and break the contact between said stop and tongue, and means for operating said striker; of a telegraph-line connected to the tongue of said transmitter, a pole-changer having two sets of terminals, one terminal of one set connected to the contact-stop of said transmitter and one of the other set connected to the striker thereof, and a source of direct current connected to the remaining brushes of both sets, the operation of said transmitter shifting the line connection from one set of pole-changer terminals to the other.

704,918. GALLEY-LOCK. ULYSSES S. G. PEOPLES and CHARLES F. WALTERS, Baltimore, Md. Filed Dec. 17, 1901. Serial No. 86,344. (No model.)

Claim.—1. The combination of a printer's type-galley; a sidestick adapted to wedge downwardly between one side bar of the galley and the type in the latter; and a presser device adapted to act inwardly against said sidestick at the open end of the galley whereby said sidestick will exert a greater pressure on the last line of type in the galley than on other lines, and will prevent said last line from toppling over.

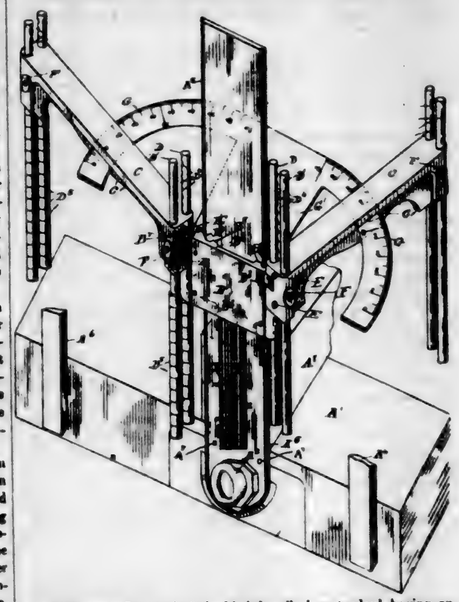
2. The combination of a printer's type-galley having a closed end and an open end, and provided on the inner wall of its lock-up side bar and at its open end with an inwardly-acting presser device; and a sidestick one end only of which is adapted to be acted on by said presser device, whereby the last line of type in the galley is prevented from toppling over.

3. A galley-lock, comprising a galley; a yielding presser device secured to one side bar of the galley at the open end thereof; and a sidestick adapted to have one end flexed by said presser device.

4. A galley-lock, comprising a galley; a sidestick adapted to wedge downwardly between one side bar of said galley and the type in the latter; and a presser secured in said side bar at the open end of the galley and adapted to press against the adjacent end only of said wedging sidestick.

5. A galley-lock, comprising a galley provided with one closed end and one open end and two side bars, one of said side bars being beveled from top to bottom on its inner wall and provided with a socket opening inwardly through said beveled wall; a presser secured in said socket and protruding through said wall; and a beveled sidestick adapted to abut against the beveled wall of said side bar and wedge downwardly between it and the type in the galley, and adapted to be pressed inwardly at one end by said presser.

704,919. MITERING AND TOOL-GUIDING DEVICE. JOHN H. J. PERLAR, Victoria, Canada. Filed Mar. 11, 1901. Serial No. 50,741. (No model.)



Claim.—1. In a tool of the kind described, a standard having an obliquely-slanting edge combined with a correspondingly-slanting grasping part, one or more tool-guides connected therewith, and means for drawing the grasping part against the standard in order to maintain it firm laterally and to compensate for wear by friction; substantially as set forth.

2. In a tool of the kind described a standard having a beveled surface; tool-guiding arms in hinge connection therewith; a collar having a face that fits and impinges against the beveled surface of the standard; this collar comprising a part that contains the means for said hinging of the arms to the standard, and another part adjustable toward it, these parts being on opposing sides of the standard; and means for effecting said adjustment; substantially as described.

3. In a bevel-indicating and tool-guiding device comprising graduated arcs; tool-guiding and angle-indicating arms hinged concentrically in relation thereto; a standard having an obliquely-slanting surface; a collar slidably connected with said standard having a part rigidly joined with the graduated arcs and also with the arm-hinging means, and an adjusting part having a slant that corresponds with the slanting surface of the standard; and means for actuating the adjustment of these parts of the collar to and against the standard and its slanting surface to preserve the collar laterally rigid with relation to the standard; vacant adjusting-space being left between the parts of the collar to admit of this adjustment; substantially as described.

4. In a tool of the kind described the combination of a standard having a beveled edge; one or more tool-guides connected therewith; and a divided collar adjustably securable on said standard, said collar bearing partly against the standard's surface and its beveled edges, substantially as set forth.

5. In a tool of the kind described the combination of a standard; one or more arms flexibly connected therewith; one or more pairs of tool-guides carried by each arm, one of which guides is to remain laterally parallel with the standard, longitudinally of the standard, and the other of which is adjustable to and from the former; means for adjustably varying the space between the members of each pair of guides, such space-varying means acting longitudinally of the respective arm; and means for pressing each adjustable guide against such space-varying means; substantially as set forth.

6. In a tool of the kind described the combination of a standard and one or more pairs of tool-guides flexibly connected therewith; one guide in each pair being rigid laterally, parallel with the standard longitudinally, and the other of which is movable from and toward the former, or rocked with relation to it so that it may be made parallel to or to converge toward

or diverge from the other and the standard (looking upward or downward), by means of a variable headed screw that operates between each such pair of guides, said movable guide being forced toward the other so as to tighten it against said screw, by a laterally-disposed retaining means: substantially as described.

7. In a tool of the kind described, the combination of a standard; one or more arms hinged thereto; one or more pairs of tool-guides slidable vertically with relation to such arm, the inner guide in each pair remaining parallel with the standard and the outer guide capable of lateral adjustment—parallel, convergently, or divergently—with relation to the other, and means for firmly securing said guides in said vertical and lateral adjustments: substantially as set forth.

8. In a tool of the kind described, a standard; an arm in hinge relation therewith; one or more pairs of tool-guides disposed transversely of the arm, and adjustable vertically and laterally with relation thereto; and means to effect these adjustments such as a screw acting longitudinally of the arm between each pair of guides; and a screw operating transversely of the arm and against one of the guides: substantially as set forth.

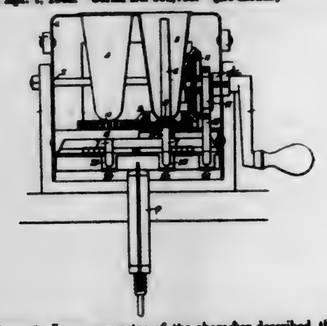
9. In such a tool the combination of a standard, having a rule impressed upon one face thereof for convenience in placing screws and bolt molding and shelter obliquely-disposed stock at the proper chest and elevation, while being operated upon; one or more arms flexibly connected with the standard; one or more pairs of tool-guides carried by such arm and vertically and horizontally adjustable thereon; means for effecting these adjustments and for moving and rocking one guide in each pair toward or away from the other in convergent, divergent, or parallel relation thereto; and an extractor for each rocking guide to bring and hold it in a required position against the rocking means, as well as to positively maintain both guides (of the pair) firm in their bifurcated adjustments: substantially as described.

10. In a tool of the kind described, the combination of a standard, an arm flexibly connected therewith, and a line of tool-guides carried by said arm, one or more guides in the line being movable to or away from the arm, transversely, substantially as described.

11. In a tool of the kind described, the combination of a standard, an arm flexibly connected therewith, two pairs of tool-guides carried by said arm, and means for rocking the pair of guides remote from the standard transversely, with relation to the arm, or, out of parallelism with the pair of guides adjacent to the standard, substantially as described.

12. In a tool of the kind described, the combination of a standard, an arm flexibly connected therewith, two or more pairs of tool-guides, a guide in each pair having depressions, a conical screw or wedge engaging said depressions, and means for pressing one guide toward the other and upon the intervening screws, substantially as described.

704,920. GROOVING-MOLD. BENNET L. POTTER, Philadelphia, Pa. Filed Apr. 7, 1902. Serial No. 101,715. (No model.)



Claim.—1. In an apparatus of the character described, the combination of the mold, scraping means suitably arranged and adapted to act upon the surface of the mold, and means for rotating said scraping means and moving them in a longitudinal direction simultaneously.

2. In an apparatus of the character described, the combination of the frame, molds carried thereby, scraping-knives arranged within said molds, depending stems projecting through the bottoms of the molds, said knives being secured to the stems, means connecting said stems whereby the knives may be rotated simultaneously, and means for giving said knives longitudinal movement as they are rotated.

3. The combination in an apparatus of the character described, of the casing, molds carried thereby, scraping-knives arranged within said molds, depending stems carrying said knives and pinions carried by said stems and meshing together, a bevel-pinion meshing with one of the other pinions, and a crank-handle operatively connected to said bevel-pinion whereby movement may be imparted to the rotating knives.

4. The combination of the casing, the frame to which said casing is pivoted, molds carried by said casing, scraping-knives arranged within said molds, and means for simultaneously rotating and longitudinally moving said scraping-knives.

5. The combination in an apparatus of the character described, of the casing, molds carried thereby, scraping-knives arranged within said casing, depending stems carrying said knives, a rocking member secured to the casing to which said stems are connected, gearing connecting said stems whereby the knives may be rotated simultaneously, and means connecting the crank-shaft and the rocking member whereby the knives may be moved longitudinally as they are rotated.

6. The combination of the frame, a movable casing carried thereby, molds carried by said movable casing, scraping devices arranged within said molds, and means for giving said scraping devices movement in two directions.

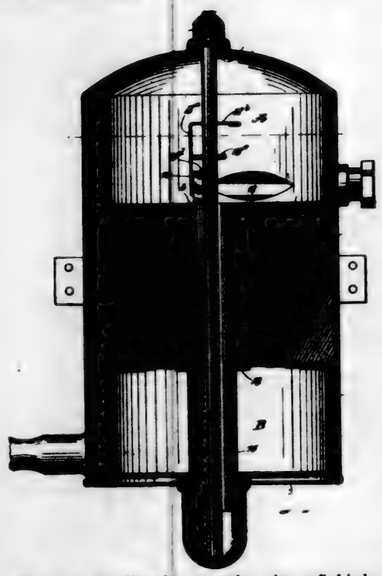
7. The combination of the fixed frame, a movable casing carried thereby, molds carried by said movable casing, scraping-knives arranged in said molds, counting mechanism carried by said casing for rotating the knives and moving them longitudinally, and means for operating said mechanism.

8. The combination of the casing, the molds carried thereby, scraping-knives arranged in said molds, depending squared stems to which said knives are attached, a cross-bar carried by the frame, gear-wheels carried by said stems and meshing together whereby the knives may be driven simultaneously, and collars carried by said cross-bars and having squared openings for the passage of the stems, said stems passing freely through the gear-wheels and collars.

9. The combination of the mold, the scraping-knife carried thereby, a depending stem to which the knife is connected, a rocking member carried by the casing, and a connection between said rocking member and the stem whereby the knife may be raised and lowered.

10. The combination of the mold, the scraping-knife carried thereby, a depending stem to which the knife is connected, a rocking member carried by the casing, and a connection between said rocking member and the stem whereby the knife may be raised and lowered, and means for rotating said knife simultaneously with the raising and lowering of the same.

704,921. FILTER. WILLIAM R. POWELL, Wheeling, W. Va., assignor of one-half to Charles Wood, Wheeling, W. Va. Filed Nov. 27, 1901. Serial No. 83,842. (No model.)



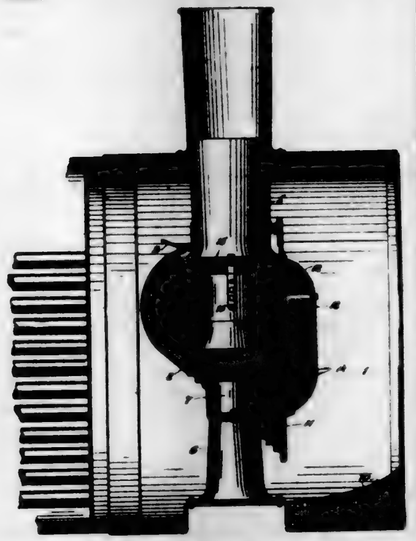
Claim.—1. In a filter, the combination, with a cylindrical casing, a removable bottom wall therefor, and a waste-liquid discharge-spigot, of a perous filtering-block secured in the casing between its ends and having a central passage therethrough, a nipple-tube extended from said central passage down through the bottom wall of the casing, a center shaft secured at its lower end to the waste-liquid discharge-spigot and at its upper end upon the top wall of the casing, a scraper device loosely mounted upon the shaft and contacting with the upper end of the perous block, a liquid-inlet pipe tapping the side of the casing and extended tangentially therefrom so as to direct a liquid-jet upon the ends of the scraper device for its rotation, and a spigot for drawing liquid from the lower portion of the casing.

2. In a filter, the combination, with a cylindrical casing, a removable bottom wall therefor, and a waste-liquid discharge-spigot, of a perous filtering-block secured in the casing between its ends and having a central passage therethrough, a nipple-tube extended from said central passage down through the bottom wall of the casing, a center shaft secured at its lower end to the waste-liquid discharge-spigot and at its upper end upon the top wall of the casing, a scraper device loosely mounted upon the shaft and contacting with the upper end of the perous block, a liquid-inlet pipe tapping the side of the casing and extended tangentially therefrom so as to direct a liquid-jet upon the ends of the scraper device for its rotation, and a spigot for drawing liquid from the lower portion of the casing.

3. In a filter of the character described, the scraper device, comprising a plate-metal body having two opened flanges projected at one side thereof, and a pair of scraper-blades clamped on the scraper-body at its lower edge, said scraper-blades being adapted to rotate and bear upon a filtering-block for removing sediment therefrom.

4. In a filter of the character described, the combination with a filtering-block held in a casing, of a shaft passing loosely through the filtering-block, and a scraper device comprising a laterally-flanged plate-metal body having perforations in the flanges for loosely receiving the shaft, and scraper-blades on the lower edge of the scraper-body, adapted for engaging the top of the filtering-block.

704,922. DRAFT DEVICE AND SPARK-ARRESTER. GEORGE B. RAFF, Sheldon, Iowa. Filed Sept. 20, 1901. Serial No. 75,670. (No model.)



Claim.—1. In an engine, a substantially bell-shaped deflector arranged in the smoke-box of the engine and having its open end forward, the said deflector having communication at its upper portion with the smoke-stack and at its lower portion with the exhaust-pipe, and the said deflector having circumferential corrugations extending in vertical plane, substantially as specified.

2. In an engine, a substantially bell-shaped deflector arranged in the smoke-box and having its open end forward, the said deflector being provided with circumferentially-disposed corrugations extending in vertical plane, perforations being formed in the depressions of said corrugations, a smoke-stack extension communicating with the upper portion of the deflector, and an exhaust communicating with the lower portion of the deflector, substantially as specified.

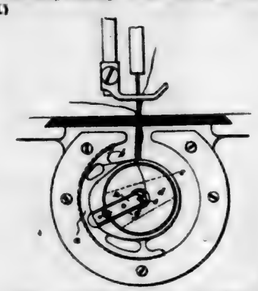
3. In an engine, a substantially bell-shaped deflector arranged between the exhaust-pipe and the smoke-stack, and wing-like deflectors extended outward from the upper portion of said bell-shaped deflector, substantially as specified.

4. In a locomotive-engine, the combination with a smoke-pipe and an exhaust pipe or nozzle, of a substantially ball-shaped screen connected at its upper portion to the smoke-stack and at its lower portion to the exhaust, and a deflector in which the screen is arranged, the said deflector being open at the front and spaced from the screen, substantially as specified.

5. In a locomotive-engine, a substantially bell-shaped deflector supported by the smoke-stack and by the exhaust-pipe of the engine and having its mouth or open end forward, and a bulbous screen arranged in the deflector and spaced therefrom and projecting beyond the forward end thereof, substantially as specified.

6. In a locomotive-engine, a substantially bell-shaped deflector supported by the smoke-stack and by the exhaust-pipe of the engine and having its mouth or open end forward, and a bulbous screen arranged in the deflector and spaced therefrom and projecting beyond the forward end thereof, the said projection having a door, substantially as specified.

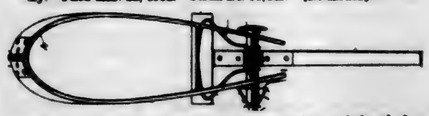
704,923. RING-SHUTTLE FOR SEWING-MACHINES. HERMANN RIEMENSCHEID, Kaiserslautern, Germany, assignor to Pfälzische Nähmaschinen & Fahrräder Fabrik, vormals Gebrüder Kayser, Kaiserslautern, Bavaria, Germany. Filed Oct. 18, 1901. Serial No. 79,089. (No model.)



Claim.—1. The combination of the spool-casing *c* carried by the oscillating shuttle-segment *a;* the spool *d* mounted in said casing; the radially-arranged spring-pressed tongue *g* pivoted in the center of oscillation of the shuttle and confining the spool in the holder and having a guide-nick *m* near its outer end; and the guide-plate *n* carried by said tongue *g*, serving to guide the thread from the periphery of the spool toward the center and having an exit-opening *o* for the passage of the thread, substantially as shown and described.

2. The combination of the spool-casing *c* carried by the oscillating shuttle-segment *a;* the spool *d* mounted in said casing; the radially-arranged spring-pressed tongue *g*, pivoted in the center of oscillation of the shuttle, confining the spool in the holder and having a lateral guide-nick *m* near its outer end, and a recess *r* in its face; and the plate *n* having a nose *p* engaging with the recess *r* in the tongue *g* and an exit-opening *o* for the thread, and serving to guide the thread from the periphery of the spool to the exit-opening *o*, substantially as described.

704,924. ANIMAL-POKE. SILAS A. RITCHIE, North Middletown, Ky. Filed Mar. 28, 1902. Serial No. 99,443. (No model.)



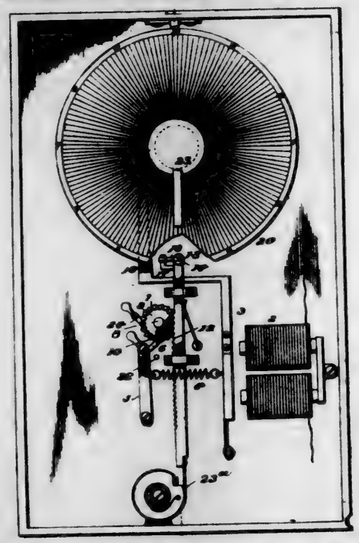
Claim.—1. An animal-poke, comprising a yoke, a tubular shaft extended through openings in the lower ends of the yoke, a spring-held push-rod movable in said shaft, spring-fingers carried by the shaft for engaging against the outer side of one portion of the yoke, a connection between said spring-fingers and the push-rod, whereby they may be drawn together, and a poke-stick mounted to swing on the shaft, substantially as specified.

2. An animal-poke comprising a yoke consisting of two hinged members, said members being provided with openings at the lower end, a tubular shaft for extending through said openings, a push-rod movable in said shaft, a spring in the shaft for holding the push-rod normally outward, spring-fingers on opposite sides of the shaft for engaging against the outer side of a member of the yoke, a connection between the ends of said spring-fingers, the said connection passing through openings in the shaft and through an opening in the push-rod, and a poke-stick mounted to swing on the shaft, substantially as specified.

3. An animal-poke comprising a yoke consisting of two hinged sec-

tions, the sections being provided at the lower ends with openings, a locking-shaft extended through said openings, a poke-stick mounted to swing on the shaft, wires mounted to swing on the shaft at opposite sides of the poke-stick, the upper ends of said wires being crossed and having rearwardly-extended pointed portions, and a cross-head on the upper end of the poke-stick and having openings to receive said rearwardly-extended portions, substantially as specified.

704,925. **RECORDER.** CHRISTOPHER J. ROACH, Hartford, Conn. Original application filed Oct. 2, 1901, Serial No. 77,323. Divided and this application filed Nov. 27, 1901. Serial No. 83,945. (No model.)



Claim.—1. The combination with a recorder having controlling mechanism, a series of locks, an electric circuit embracing all the locks and the recorder, said locks having controlling mechanisms so arranged relatively that each lock may be opened only in its successive order, means in each lock for breaking the circuit as its respective controlling mechanism is set to allow the lock to be manually operated, and means for closing the circuit as each lock is so operated so that the controlling mechanisms of all the locks and that of the recorder will be actuated, as set forth.

2. The combination of a recorder, a series of locks, such locks and recorder being electrically connected together, controlling mechanism in the several locks relatively arranged so that each lock can be opened only in its successive order, means for actuating the recorder and the controlling mechanism upon the closing of the circuit, means for breaking such circuit as the controlling mechanism of any one lock of the series is positioned to permit of the manual operation of such lock, and means for reëstablishing such circuit when such lock is so operated, the recorder being actuated upon the operation of each lock.

3. The combination of a time-recorder, a series of locks electrically connected together and with said recorder, controlling mechanism for the several locks relatively arranged so that upon the closing of the circuit the controlling mechanisms of all the locks will be actuated but that of only one lock at a time will be positioned to permit of the operation of such lock, means for breaking the circuit as the mechanism of one lock is so positioned, and an auxiliary circuit-closer for each lock designed to be actuated by the withdrawal of the bolt of any one lock, whereby the controlling mechanism of all the remaining locks will be actuated as will also the recording mechanism of the time-recorder, as set forth.

4. The combination of a series of locks and a time-recorder, said locks being electrically connected to each other and to the time-recorder, each lock having controlling mechanism and means to break the circuit as such mechanism of any one lock is positioned to permit of the withdrawal of the bolt thereof, means for closing such circuit by such withdrawal of the locking-bolt, said time-recorder having mechanism actuated upon the closing of the circuit in any one of the locks, a recording-dial, and a marker for indicating thereon when the circuit is closed by the withdrawal of the bolt of any one of the locks, as set forth.

5. The combination with a series of locks electrically connected together and having controlling mechanism operated in step-by-step order upon the closing of the circuit, means for breaking the circuit as the controlling mechanism of any lock is brought into position to permit of the withdrawal of the bolt thereof, the controlling mechanisms of the several locks being relatively arranged so that each lock may be opened only in its successive order, and means for reëstablishing the circuit upon the withdrawal of the bolt of any one lock, of a time-recorder in electric circuit with said locks having recording mechanism actuated as the circuit is reëstablished by the withdrawal of the bolt of any lock of the series, as set forth.

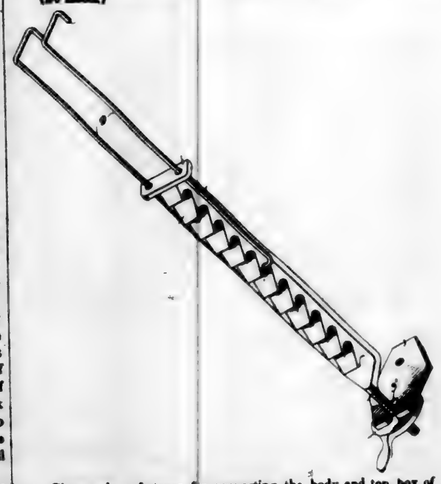
6. In combination with a series of locks electrically connected together and having controlling mechanism relatively arranged so that each lock may be opened only in its successive order, of a time-recorder in circuit with said locks, such recorder having controlling mechanism corresponding to that of the locks, means for actuating the controlling mechanism of the locks and recorder upon the closing of the circuit in the operation of any one of the locks, and means actuated by the controlling mechanism of the recorder for indicating the time at which any lock is manually operated, as set forth.

7. In a time-recorder, a dial, a marker, a longitudinally-movable rack-bar carrying the latter, a toothed pinion engaging the rack-bar, means for rotating such pinion, a magnet for actuating such means, and means for operating such marker, such latter means being also operated by the magnet, as set forth.

8. In a time-recorder, a dial, a marker, a longitudinally-movable rack-bar carrying the latter, a toothed pinion engaging the rack-bar, having a segmental toothless portion, means for rotating such pinion, a magnet for actuating such means, means for operating such marker also actuated by the magnet, and means for returning the rack-bar to its normal position when it is engaged by said segmental toothless portion, as set forth.

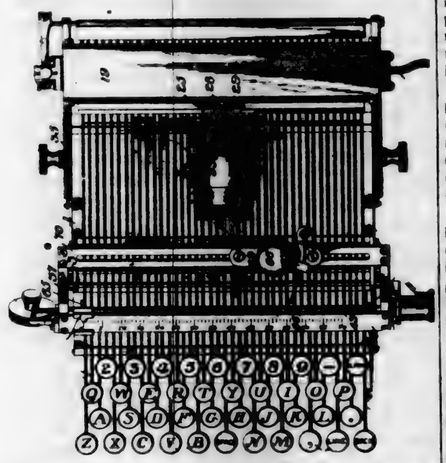
9. The combination, in a time-recorder, of a recording-dial, a magnet and its armature, a ratchet-wheel, a pawl engaging therewith, a lever carrying such pawl, said lever being connected to said armature, a gear-pinion carried by the ratchet-wheel, a rack-bar with which such pinion engages, a marker on said rack-bar, a lever engaging such marker and designed to be actuated by the armature, said pinion having a segmental toothless portion, and a spring connected to said rack-bar for returning the same to its normal position when the bar is engaged by said toothless portion, substantially as set forth.

704,926. **TOP-BOX FASTENER FOR WAGON-BODIES.** CHARLES A. ROBERTS, Rensselaer, Ind. Filed Mar. 31, 1902. Serial No. 100,781. (No model.)



Claim.—In a fastener for connecting the body and top box of a wagon, the combination with a wagon-body and box resting thereon, of a bracket-plate secured to the under side of the wagon-body and having a projecting end bifurcated to form an open slot, a rack-bar extending vertically alongside the wagon-body and box and provided at its upper end with eyes and at its lower end with a threaded stem fitting in said slot, said stem being removable from the slot by a movement outwardly from the wagon-body, an adjusting-nut engaging the stem and bridging the slot and bearing against the under side of the bracket-plate, and a U-shaped bail sliding through the eyes and having its return portion adapted to engage the teeth on the rack-bar and having its arms provided at their free ends with hooks to take over the edge of the top box, whereby, upon elevating the bail and slackening the nut, the stem may be slid outward from the slot and the fastener removed, substantially as and for the purpose set forth.

704,927. **KEYBOARD FOR USE IN TELEGRAPHY.** HENRIETTA H. ROWLAND, Baltimore, Md., administratrix of Henry A. Rowland, deceased, assignor to Rowland Telegraphic Company, Baltimore, Md., a Corporation of New Jersey. Filed July 24, 1901. Serial No. 69,336. (No model.)



Claim.—1. In a transmitting-keyboard for electric telegraphs, the combination with a group of conductors leading into said keyboard, a series of electrical contacts of greater number than said conductors, said contacts electrically connected to said conductors in prearranged combinations, and means operating in conjunction with said contacts for operating circuits through said conductors and contacts.

2. In a transmitting-keyboard for electric telegraphs, the combination with a group of conductors leading into said keyboard, a series of electrical contacts of greater number than said conductors, permanent electrical connection between said contacts and said conductors by which said contacts and conductors are connected in prearranged combinations, and means for operating circuits through said conductors and sets of said contacts.

3. In a transmitting-keyboard for electric telegraphs, the combination with a group of conductors leading into said keyboard, a series of electrical contacts of greater number than said conductors, permanent electrical connection between said contacts and said conductors by which said contacts and conductors are connected in prearranged combinations, and means comprising a plurality of keys for operating circuits through said conductors and sets of said contacts.

4. In a transmitting-keyboard for electric telegraphs, the combination with a group of conductors leading into said keyboard, a series of fixed electrical contacts of greater number than said conductors, a series of movable contacts adapted to engage said fixed contacts and in permanent electrical connection therewith, permanent electrical connection between said fixed contacts and said conductors by which said contacts and conductors are connected in prearranged combinations, and means comprising a plurality of keys for making and breaking circuits from said conductors through sets of said contacts.

5. In a transmitting-keyboard, a series of rigid electrical contacts, a series of electrical conductors permanently connected to said contacts in combinations, a series of movable contacts comprising a series of pins, one of said pins adapted to reciprocate in each of said rigid contacts and permanently electrically connected thereto, a series of key-levers, each adapted when operated to engage a combination of said movable contacts, substantially as described.

6. In a transmitting-keyboard, a series of electrical contacts and a series of electrical conductors permanently connected to said contacts in combinations, an insulating-plate in which said contacts are rigidly mounted and through which they pass, a plate of insulating material mounted below said contacts, a series of contact-pins passing through said plate and adapted to reciprocate therein, each of said pins having an elongated stem adapted to reciprocate in one of said rigid contacts, a coil-spring surrounding the said portion of each of said pins and permanently connected electrically at its upper end to the rigid contact and at its lower end to the reciprocating pin-contact, and a series of key-levers each adapted to engage when operated a combination of said reciprocating contacts, substantially as described.

7. In a transmitting-keyboard, the combination with the key-levers, of the clapper-locking mechanism, comprising a pivoted rocking clapper-bar extending across the tops of the said key-levers, a series of lugs one upon each key-lever, adapted to be engaged by said clapper-bar, an upwardly-projecting tongue carried by said clapper-bar, a magnet-plunger normally abutting against said tongue, an iron-clad magnet into which said plunger is adapted to be drawn, springs connected to the clapper-bar and normally forcing the tongue of said clapper-bar against the plunger of said magnet, and tending to force the plunger out of said magnet, and a frame in which said magnet is rigidly mounted, substantially as described.

8. In a transmitting-keyboard, the combination with the keys and key-levers, of the counting mechanism comprising a scale, an indicator mounted to travel on said scale, an electromagnet, an auxiliary contact-maker completing a circuit through said magnet upon the operation of said keys and causing the said indicator to be advanced step by step over said scale, and means operated by one of said keys for returning said indicator to the initial position, substantially as described.

9. In a transmitting-keyboard, the combination with the keys and key-levers, of the counting mechanism, comprising a scale, an indicator mounted to travel over said scale, ratchets carried by said indicator, shifting rods adapted to be engaged by said ratchet, means for imparting longitudinal movement to one of said shifting rods, whereby step-by-step longitudinal movement is imparted to said indicator, and means for returning the indicator to its initial position by the rotation of said shifting rods.

10. In a transmitting-keyboard, the combination with the keys and key-levers, of a counting mechanism, comprising a scale, and an indicator mounted to travel over said scale, a pair of parallel shifting rods, extending longitudinally of said scale and each capable of rotation around its longitudinal axis, oppositely-disposed ratchets carried by said indicator, each one of said ratchets engaging one of said ratchet-rods, means for reciprocating one of said rods longitudinally, whereby step-by-step movement is imparted to said indicator, and means for rotating said shifting rods whereby the teeth thereof are disengaged from the pawls of said indicator, and means for returning said indicator to its initial position when its ratchets are thus disengaged from the teeth of said rods, substantially as described.

11. In a transmitting-keyboard, the combination with the keys and key-levers, of the counting mechanism, comprising a scale and an indicator mounted to travel over said scale, a pair of parallel shifting rods extending longitudinally of said scale and each capable of rotation around its longitudinal axis, oppositely-disposed ratchets carried by said indicator, each one of said ratchets engaging one of said shifting rods, a magnet-plunger connected to the end of one of said ratchets for reciprocating said rod, whereby step-by-step motion is imparted to said indicator, an electromagnet into which said plunger is adapted to operate, an auxiliary contact-maker adapted to complete the electric circuit through said magnet upon the operation of each of a series of the said keys, and means for rotating said shifting rods whereby the teeth thereof are disengaged from the pawls of said indicator, and means for returning said indicator to its initial position when its ratchets are thus disengaged from the teeth of said rods, substantially as described.

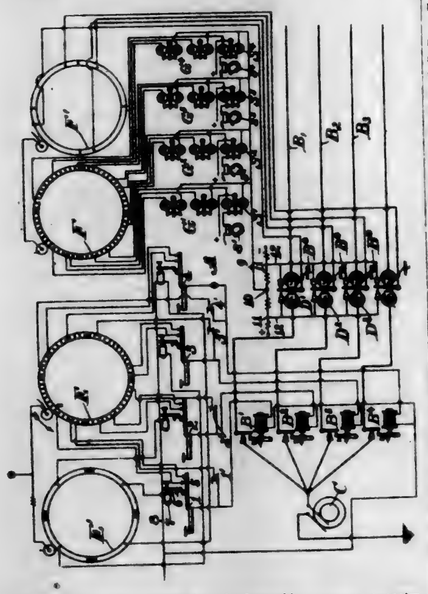
12. In a transmitting-keyboard, the combination with the keys and key-levers, of the counting mechanism, comprising a scale and an indicator mounted to travel over said scale, a pair of parallel shifting rods extending longitudinally of said scale and each capable of rotation around its longitudinal axis, oppositely-disposed ratchets carried by said indicator, each one of said ratchets engaging one of said shifting rods, means for reciprocating one of said bars whereby step-by-step motion is imparted to said indicator, a pinion mounted on each of said shifting rods, a rack engaging said pinions, operative connection between one of said key-levers and said rack, whereby the operation of said key-lever shifts said rack and rotates said shifting rods, thereby disengaging the teeth thereof from said ratchets, a spring-actuated wheel and flexible connection from said wheel to said indicator whereby said indicator is returned to its initial position after the disengagement of said ratchets with said teeth, substantially as described.

13. In a transmitting-keyboard, the combination with the keys and key-levers, of the counting mechanism, comprising a scale and an indicator mounted to travel over said scale, a pair of parallel shifting rods extending longitudinally of said scale, and each capable of rotation around its longitudinal axis, oppositely-disposed ratchets carried by said indicator, each one of said ratchets engaging one of said shifting rods, a magnet-

plunger connected to the end of one of said shifting rods for reciprocating the same, whereby step-by-step motion is imparted to said indicator, an iron-clad electromagnet into which said plunger is adapted to pass, an auxiliary contact-maker adapted to complete the electric circuit through said magnet upon the operation of each of a series of the said keys, and means for rotating said shifting rods whereby the teeth thereof are disengaged from the pawls of said indicator and means for returning said indicator to its initial position when its ratchets are thus disengaged from the teeth of said rods, substantially as described.

14. In a transmitting-keyboard, the following instrumentalities, viz: a series of key-levers, and keys carried thereby, a series of reciprocating electrical contacts, a series of electrical conductors connected to said contacts in combinations, combinations of said reciprocating contacts adapted to be engaged by said key-levers upon their operation, the clapper-locking mechanism and clapper-magnet operating the same, and the counting mechanism, substantially as described.

704,928. TELEGRAPHIC DISTRIBUTION. HESRIETTA H. ROWLAND, Baltimore, Md., administratrix of Henry A. Rowland, deceased, assignor to Rowland Telegraphic Company, Baltimore, Md., a Corporation of New Jersey. Filed July 24, 1901. Serial No. 69,538. (No model.)



Claim.—1. In the distribution of telegraphic messages, a central station and a plurality of substations, a source of periodic signaling-current located at the central station, telegraph-lines leading from said central station to said substations and supplied with current from the said source, main-line transmitting and receiving instruments located at the central station and at each of the substations, and means located at central and at each of the substations whereby the central and substations may be placed in communication with each other at rapidly-recurring periods, substantially as described.

2. In the distribution of telegraphic messages, a central station and a plurality of substations, an alternating-current dynamo located at the central station, telegraph-lines leading from said central station to said substations, and supplied with current from said dynamo, main-line receiving and transmitting instruments located at the central station and each of the substations, and means located at central and any of the substations whereby the central and substations may be placed in communication with each other at rapidly and regularly recurring periods of time, substantially as described.

3. In the distribution of telegraphic messages, a central station and a plurality of substations, a source of periodic signaling-current located at the central station, telegraph-lines leading from said central station to said substations and supplied with current from said source, main-line transmitting and receiving instruments located at central and at each of the substations, current-distributors located at central and at the substations whereby the central and substations may be placed in communication with each other at regularly and rapidly recurring periods, substantially as described.

4. In the distribution of telegraphic messages, a central station and a plurality of substations, a source of periodic signaling-current located at the central station, telegraph-lines leading from said central station to the substations, and supplied with current from said source, main-line transmitting and receiving instruments located at central and at each of the substations, synchronously-operated current-distributors located at central and at the substations whereby the central and substations may be placed in communication with each other at rapidly-recurring periods, circuit making and breaking devices operated by said current-distributors for impressing the characters upon the line-current, and local receiving apparatus operated by the main-line receiving instruments through the medium of said current-distributors, substantially as described.

5. In the distribution of telegraphic messages a central station and a plurality of substations, a source of alternating signaling-current located at the central station only, telegraph-lines leading from said central station to said substations and supplied with current from said source, main-line transmitting and receiving instruments located at central and at each of the substations continuously and synchronously rotating current-distributers located at central and at the substations whereby the central and substations may be placed in communication with each other at regular and rapidly recurring periods, substantially as described.

6. In the distribution of telegraphic messages, a central station and a plurality of substations, a source of alternating signaling-current located at the central station, telegraph-lines leading from said central station to the substations, and supplied with current from said source, main-line transmitting and receiving instruments located at central and at each of the substations, synchronously and continuously operated current-distributers located at central and at the substations whereby the central and substations may be placed in communication with each other at rapidly-recurring periods, circuit making and breaking devices located in the circuits of said current-distributers for impressing the characters upon the line-current, and local receiving apparatus operated by the main-line receiving instruments through the medium of said current-distributers, substantially as described.

7. In the distribution of telegraphic messages, a central station and a plurality of substations, a source of periodic signaling-current located at the central station, telegraph-lines leading from said central station to said substations and supplied with current from said source, main-line transmitting and receiving instruments located at central and at each of the substations, synchronously-operated current-distributers located at central and at the substations, means regulated by the signaling-current for maintaining the synchronism of said current-distributers at the substations, local transmitting and receiving apparatus located at the central station and at the substation and rendered operative at regularly-recurring periods by the said current-distributers, substantially as described.

8. In the distribution of telegraphic messages, a central station and a plurality of substations, a source of periodic signaling-current located at the central station and at each of the substations, duplex telegraph-lines leading from said central station to said substations and supplied with current from said source, main-line transmitting and receiving instruments located at central and at each of the substations, synchronously-operated current-distributers located at central and at the substations, means regulated by the signaling-current for maintaining the synchronism of said current-distributers, local transmitting and receiving apparatus located at the central station and at the substations and rendered operative at regularly-recurring periods by the said current-distributers, substantially as described.

9. In the distribution of telegraphic messages, a central station and a plurality of substations, a source of periodic signaling-current located at said central station telegraph-lines leading from the central station to said substations and supplied with current from said source, main-line transmitters and main-line receiving-relays located at the central station and at the substations, the line receiving-relay for each line located at central, being balanced and operated by the current reflected back from the substation to central, and means located at central and at the substations, whereby the central and substations may be placed in communication with each other at rapidly-recurring periods, substantially as described.

10. In the distribution of telegraphic messages, a central station and a plurality of substations, a source of signaling-current located at the central station, telegraph-lines leading from said central station to said substations, and supplied with current from the said source, a main-line transmitter and a main-line receiving-relay at central for each of the lines, and a main-line transmitter and a main-line receiving-relay located at each of the substations, synchronously-operated current-distributers located at central and at the substations, means regulated by the signaling-current for maintaining the synchronism of said current-distributers at the substations, and allotting (for the transmission of signals), a fixed number of impulses of said periodic current to each of said lines in rapid succession, and local transmitting and receiving instruments operating in conjunction with said current-distributers, substantially as described.

11. In the distribution of telegraphic messages, a central station and a plurality of substations, a source of alternating signaling-current located at the central station, telegraph-lines leading from said central station to said substations, and supplied with current from the said source, a main-line transmitter and a main-line receiving-relay at central for each of the lines, and a main-line transmitter and a main-line receiving-relay located at each substation for its respective line, synchronously-operated current-distributers located at the central station and at the substations and allotting a fixed number of impulses of said periodic current to each of said lines for signaling purposes in rapid succession, and local transmitting and receiving instruments operating in conjunction with said current-distributers, substantially as described.

12. In the distribution of telegraphic messages, a central station, at which is located a source of periodic signaling-current, a plurality of telegraph-lines supplied with current from said source, means for impressing the characters or signals upon said lines, and means for receiving the messages upon each line separately, current-distributers adapted to bring the said means for impressing the characters upon the lines and said means for receiving the messages into operation at rapidly-recurring periods, substantially as described.

13. In the distribution of telegraphic messages, a central station and a plurality of substations, a source of periodic signaling-current located at the central station, telegraph-lines leading from the central station to said substations and supplied with current from said source, a main-line transmitter and a main-line receiving-relay located at central and at each of the substations, means located at central for allowing the transmitting instruments at the substations exclusive use of the receiving-relay at the central station successively and at rapidly-recurring periods, substantially as described.

14. In the distribution of telegraphic messages, a central station and a plurality of substations, a source of periodic signaling-current located at the central station, telegraph-lines leading from said central station to said substations and supplied with current from said source, a main-line transmitter and a main-line receiving-relay located at central, the said relay being balanced with respect to all of the lines, a main-line transmitter and receiving-relay at each of the substations, and means located at the central station for allowing the transmitters at the substations exclusive use of the main-line receiving-relay at central successively and at rapidly-recurring periods, substantially as described.

15. In the distribution of telegraphic messages, a plurality of substations, in combination with a central station comprising the following elements, viz., a source of periodic signaling-current, groups of telegraph-lines leading to groups of substations and supplied with current from the said source, main-line transmitters and main-line receiving-relays, one of each for each group of lines, synchronously-operated current-distributers, a series of local transmitting and receiving instruments operating in conjunction with the main-line instruments and rendered operative at rapidly-recurring intervals by said current-distributers, and switching devices for changing the local instruments from one to the other of said main-line instruments.

16. In the distribution of telegraphic messages, a plurality of substations, in combination with a central station comprising the following elements, viz., a source of alternating signaling and synchronizing current, groups of telegraph-lines leading to groups of substations, and supplied with current from the said source, main-line transmitters and main-line receiving-relays, one of each for each group of lines, synchronously-operated current-distributers, a series of local transmitting and receiving instruments operating in conjunction with the main-line instruments and rendered operative at rapidly-recurring intervals by said current-distributers, and switching devices for changing the local instruments from one to the other of said main-line instruments.

17. In the distribution of telegraphic messages, a plurality of substations in combination with a central station, comprising the following elements, viz., a source of periodic signaling-current, groups of telegraph-lines leading to groups of substations, and supplied with current from the said source, main-line receiving-relays at central, one for each group of lines, a local receiving-circuit relayed from the main line synchronously-operated current-distributers located in said local circuit, a series of local receiving instruments operating in conjunction with the main-line instruments and rendered operative at rapidly-recurring intervals by said current-distributers, and switching devices for changing the local instruments from one to the other of said main-line instruments, substantially as described.

18. In the distribution of telegraphic messages an alternating-current dynamo-electric machine, a plurality of telegraphic lines leading from one of the terminals of said dynamo, main-line transmitting instruments located at the dynamo ends of said lines, and at the distant ends thereof for impressing the messages upon the current carried by said lines, receiving instruments located at corresponding points, and means for allowing said instruments the use of their lines at rapidly-recurring periods, substantially as described.

19. In the distribution of telegraphic messages an alternating-current dynamo-electric machine, a plurality of telegraphic lines leading from one of the terminals of said dynamo, main-line transmitting instruments located at the dynamo ends of said lines, and at the distant ends thereof for impressing the messages upon the current carried by said lines, receiving main-line relays located at corresponding points, the relays at the dynamo ends of said lines being balanced and operated by the current reflected back from the distant ends, and means for allowing said instruments and relays the use of their lines at rapidly-recurring periods, substantially as described.

20. In the distribution of telegraphic messages, a central station comprising the following elements, viz., an alternating-current generator, a main local conductor supplied with current from said generator, a plurality of transmitters located in the circuit of said conductor, a series of branch telegraph-lines leading from each transmitter, local-current distributers, and a series of local transmitting instruments for operating the main-line instruments and rendered operative at rapidly-recurring intervals by said current-distributers and switching devices for interchanging said transmitters, substantially as described.

704,929. MEANS FOR PRODUCING AND MAINTAINING SYNCHRONOUS MOTION. HESRIETTA H. ROWLAND, Baltimore, Md., administratrix of Henry Augustus Rowland, deceased, assignor to Rowland Telegraphic Company, Baltimore, Md., a Corporation of New Jersey. Original application filed July 24, 1901, Serial No. 69,534. Divided and this application filed Dec. 11, 1901. Serial No. 85,519. (No model.)

Claim.—1. In a synchronous system, the combination with a dynamo-electric machine, of a body with which said dynamo is to be synchronized, a circuit-changer controlled by the said dynamo, and a circuit-changer controlled by said body, an electric circuit completed from the armature-coils of said dynamo through both of said circuit-changers at rapidly-recurring intervals, electric-energy-absorbing means included in said circuit and exerting a continuous synchronizing effect upon said dynamo, by varying the energy absorbed by said dynamo with every variation in the speed of the body with which synchronism is to be maintained.

2. In a synchronous system, the combination with a dynamo-electric machine, of a body with which said dynamo is to be synchronized, a circuit-changer controlled by the said dynamo, and a circuit-changer controlled by the said body, an electric circuit completed from the armature-coils of said dynamo through both of said circuit-changers at rapidly-recurring intervals, electric-energy-absorbing means included in said circuit and exerting a continuous synchronizing effect upon said dynamo, by varying the energy absorbed by said dynamo with every variation in the speed of the body with which synchronism is to be maintained, said synchronizing effect being independent of the polarity of the current in the energy-absorbing circuit.

3. In a synchronous system, the combination with the dynamo-electric machine, of a body with which said dynamo is to be synchronized, said dynamo having a normal tendency to accelerate its speed relative to that of said body, a circuit-changer controlled by the said dynamo, and a circuit-changer controlled by the said body, an electric circuit completed from the armature-coils by and through both of said circuit-changers at rapidly-recurring intervals, electric-energy-absorbing means included in said circuit, and exerting a continuous synchronizing effect by varying the energy absorbed by said dynamo with every variation in the speed of the body with which synchronism is to be maintained.

4. In a synchronous system, the combination with an electric dynamo or motor and a body with which said dynamo is to be synchronized, of means for exerting a continuous regulating effect upon said dynamo or motor, said effect being the integral effect of a series of rapidly-recurring loads thrown upon said dynamo or motor, the duration of each of said loads varying with every change of speed of the said body with which the dynamo or motor is being synchronized.

5. In a synchronizing system, the combination with an electric dynamo or motor and a body with which said dynamo or motor is to be synchronized, of means for exerting a continuous regulating effect upon said dynamo or motor, said effect being the integral effect of a series of rapidly-recurring loads thrown upon said dynamo or motor, the duration of each of said loads varying with every change of speed of the said body with which the dynamo or motor is being synchronized, said regulating effect being independent of the polarity of the current in either of the elements of the said dynamo or motor.

6. In a synchronous system, the combination with a body with which synchronism is to be maintained and an electric dynamo or motor to be synchronized, of a set of regulating-coils carried by said dynamo or motor, electrical-energy-absorbing means, an electric circuit including said energy-absorbing means, and the regulating-coils of said dynamo or motor, circuit-changing devices for continuously connecting said energy-absorbing means in circuit with said regulating-coils and disconnecting the same therefrom at rapidly-recurring intervals, the duration of said intervals changing as the said dynamo or motor varies its phase with respect to the body with which synchronism is to be maintained.

7. In a synchronous system, the combination with a body with which synchronism is to be maintained and an electric dynamo or motor to be synchronized, regulating-coils carried by said dynamo or motor, and continuously-acting automatic means for throwing an intermittent load upon the coils of said dynamo or motor, said load varying with every change in speed of the said body with which synchronism is to be maintained.

8. In a synchronous system, the combination with a body with which synchronism is to be maintained and an electric dynamo or motor to be synchronized, said dynamo or motor having a normal tendency to accelerate its speed relative to said body, electrical-energy-absorbing means adapted to exert a retarding effect on the speed of said dynamo or motor independent of the polarity of the current therethrough, and means for connecting said energy-absorbing means into the circuit of said dynamo or motor, and disconnecting the same therefrom at intervals varying in duration with the change of phase between the dynamo or motor and said body.

9. In a synchronous system, the following instrumentalities, viz., a body with which synchronism is to be maintained and a body to be synchronized, a moving contact-maker governed by the first-named body, and a moving contact-maker governed by the body to be synchronized, an electric circuit including both of said contact-makers, electrical-energy-absorbing means adapted to be connected in circuit with both of said contact-makers, and disconnected therefrom intermittently, and to accelerate a retarding effect upon the body to be synchronized independent of the polarity of the current in said circuit, said retarding effect being the continuous integral result of a series of rapidly-recurring loads thrown upon said body to be synchronized by said energy-absorbing means, the time for which said loads are on said body varying as the difference in phase between the two bodies varies.

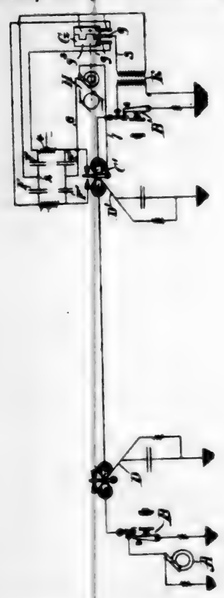
10. In a synchronous system, the combination with a controlling line-circuit carrying a periodically-varying electric current, a moving contact-maker controlled by the current in said circuit, an electric dynamo or motor to be synchronized, a moving contact-maker controlled by said dynamo or motor, and an electric circuit including both of said contact-makers and the armature of said dynamo or motor, an electric-energy-absorbing means adapted to be connected in said circuit through the instrumentality of said contact-makers at regular and rapidly-recurring intervals, the duration of said intervals varying as the said dynamo or motor varies its phase with respect to the body with which synchronism is to be maintained.

11. In a synchronous system, the combination with a controlling line-circuit, of a dynamo-electric machine delivering a periodically-varying current thereto, a moving contact-maker controlled by the current in said circuit, a dynamo-electric machine to be synchronized, a moving contact-maker controlled thereby, electrical resistance connected to the armature of said last-named dynamo, and connected in circuit therewith and with both of said contact-makers and disconnected therefrom at regular intervals, the said intervals varying in duration with the change of phase between said dynamos, and exerting a continuous synchronizing effect upon the dynamo to be synchronized, independent of the polarity of the current in either of the elements of said dynamo.

12. In a synchronous system, the following instrumentalities, viz., a line carrying a controlling electric current, a synchronous motor governed by the said controlling-current, a moving contact-maker controlled by the said synchronous motor, a dynamo-electric machine or motor to be synchronized, a moving contact-maker controlled by said dynamo or motor, said dynamo or motor having a tendency to accelerate its speed with relation to the said synchronous motor, and means for retarding said acceleration, said means being electrical resistance connected in the circuit of said dynamo or motor at intervals varying in duration as the phase between the said motor or dynamo and said synchronous motor varies.

704,930. MEANS FOR IMPRESSING PERIODICALLY-VARYING ELECTRIC CURRENTS UPON TELEGRAPH OR OTHER CIRCUITS. HENRIETTA H. ROWLAND, Baltimore, Md., administratrix of HENRY AUGUSTUS ROWLAND, deceased, assignor to Rowland Telegraphic Company, Baltimore, Md., a Corporation of New Jersey. Original application filed July 26, 1901, Serial No. 69,894. Divided and this application filed Dec. 11, 1901. Serial No. 85,518. (No model.)

Claim.—1. The combination of a source of direct electric current and means for producing a periodically-varying current from said direct current, an electric circuit, and a transformer by which said periodically-varying current is impressed upon said electric circuit



2. The combination with an electric circuit, of a source of periodically-varying electric current located at one end of said circuit and delivering thereto a normally continuous current, a source of direct current located at the other end of said circuit, a current-changing device operated in synchronism with the said periodically-varying current and producing a periodically-varying current from said source of direct current, and means for impressing the current derived from said source of direct current upon the said circuit.

3. In a telegraph-line, the combination of a transformer located in the main-line circuit, means for producing a periodically-varying current from a source of direct current connected to the primary of said transformer, and means for impressing said periodically-varying current upon the line.

4. In a duplex telegraph-line, the combination of a transformer located in the main-line circuit, means for producing a periodically-varying current from a source of direct current connected to the primary of said transformer, and means for impressing said periodically-varying current upon the duplex line.

5. The combination, in a duplex telegraph-line, of a source of direct electric current, means for producing a periodically-varying electric current from said direct current and a transformer by which said periodically-varying current is impressed upon the duplex line.

6. In a duplex line, the combination with an alternating-current dynamo located at one end of said line, and supplying current thereto, of a source of direct current located at the other end of said line, a pole-changer, a circuit in which the direction of the current is varied by said pole-changer and in which the current is derived from said source of direct current, and means for impressing the periodically-varying current produced by this device upon the main line.

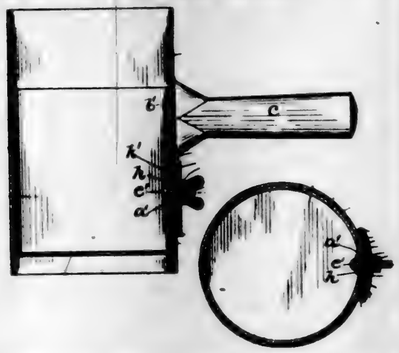
7. In a duplex telegraph-line, the combination with a dynamo-electric machine located at one end of said line and delivering a normally continuous alternating current thereto, of a transformer located in the main-line circuit at the other end of said line, means for producing a periodically-varying electric current from a source of direct current connected to the primary of said transformer, and means for impressing said periodically-varying current upon the duplex line.

8. In a duplex telegraph-line, the combination with a dynamo-electric machine located at one end of said line and supplying current thereto, of a circuit located at the other end of said line in which a periodically-varying current is derived from a source of direct-current supply, a transformer receiving current from said circuit, and the said transformer impressing upon the said line the current induced in it from said circuit.

9. In a duplex telegraph-line, the combination with a source of periodically-varying electric current located at one end of said line, of a duplex transmitter located at the other end of said line, a transformer having its secondary connected in series with the main-line circuit, a source of direct current, a circuit in which a periodically-varying current is produced from said direct current, a current-changing device for producing said periodically-varying current, said circuit being connected to the primary of said transformer and a synchroniser operating in synchronism with the periodically-varying current from the other end of the line and driving said current-changing device.

10. In a duplex telegraph-line, the combination with an alternating-current dynamo-electric machine located at one end of said line and delivering current thereto, a source of direct current located at the other end of said line, a synchroniser rotating in synchronism with said dynamo-electric machine, a current-changing commutator driven by said synchroniser, a local circuit deriving current from said source of direct current and in which the direction of the current is periodically varied by said current-changer, and a transformer having its primary connected in the circuit of said current-changer and its secondary in the main line.

704,931. MEASURING-SCOOP. LEMOS M. REED, Cleveland, Ohio. Filed Apr. 7, 1902. Serial No. 101,753. (No model.)



Claim.—A measuring-scoop comprising two telescopic sections and having the following: a bottom-forming head at one end and forming a part of one of the said sections; a slot formed in and longitudinally of one of the said sections and a perforation formed in the other section in registry with the said slot; a screw extending through the said slot and through the aforesaid perforation and arranged with its head interiorly of the inner section; a washer mounted upon the shank of the screw at the inner end of the nut externally of the outer section; a card-holder mounted upon the said screw between the said washer and the external surface of the outer section, and another washer interposed between the head of the screw and the interior surface of the inner section, substantially as and for the purpose set forth.

704,932. METAL RAILWAY-TIE. ALBERT J. REITZ, Portsmouth, Ohio, and JOSEPH H. LASER, Allegheny, Pa. Filed Dec. 23, 1901. Serial No. 86,962. (No model.)

Claim.—1. A metallic railroad-tie consisting of a plurality of connected tubular sections having corrugated walls.

2. A metallic railroad-tie consisting of a plurality of tubular sections connected by a rigid web and having corrugated walls.

3. A metallic railroad-tie consisting of a plurality of substantially rectangular tubular sections connected at their lower adjacent corners by a rigid web, said sections having their upright walls corrugated.

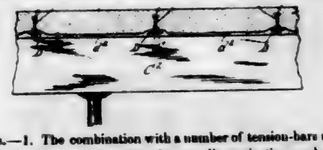
4. A metallic railroad-tie consisting of a plurality of connected tubular sections formed of a single continuous sheet or plate of metal and having corrugated walls.

5. A metallic railroad-tie consisting of a plurality of tubular substantially rectangular sections with their lateral walls corrugated and connected along their lower adjacent angles by a web, said web and sections being formed of a single continuous sheet or plate of metal.

6. The combination of a metallic railroad-tie consisting of a plurality of substantially rectangular tubular sections connected along their lower adjacent angles by a web, a bed-plate resting on said tubular sections, a rail resting on said bed-plate, a clamping-finger having a lip engaging the rail and a rib bearing on the plate, and a bolt passing through the clamping-finger, bed-plate and tie, whereby the rail is firmly secured in position.

704,982

704,933. BUILDING CONSTRUCTION. WILLIAM M. RILEY, Chicago, Ill. Filed Dec. 30, 1901. Serial No. 87,758. (No model.)



Claim.—1. The combination with a number of tension-bars suitably supported at their ends, of a series of upwardly-projecting anchors provided on their lower portions with nuts located above and below the tension-bars and at their upper ends with engaging means, wire-cloth located in a horizontal plane above the suspension-bars, and a mass of concrete or other plastic material embedding said bars, anchors, and wire-cloth, substantially as described.

2. The combination with a number of tension-bars suitably supported, of a series of upwardly-projecting anchors, a series of rods located in a plane parallel with the suspension-bars and engaged by the upper ends of said anchors, a mass of concrete or other plastic material embedding said bars, rods and anchors, substantially as described.

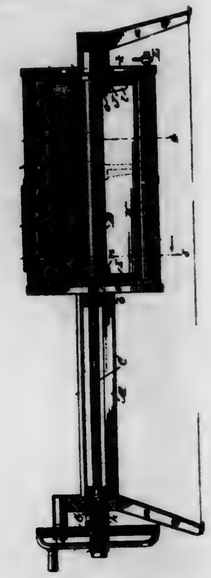
3. The combination with a number of tension-bars suitably supported, of a series of upwardly-projecting anchors, a number of rods located in a parallel plane with and above the suspension-bars and connected to the upper ends of the anchors, a mass of concrete or other plastic material embedding said bars, rods and anchors and formed with air-chambers, sheets of metal located in the upper portion of the air-chambers, substantially as described.

704,934. COMBINED WASHING AND WRINGING MACHINE. JOSEPH W. ROGERS, Montgomery, Pa. Filed Feb. 17, 1902. Serial No. 94,461. (No model.)

Claim.—1. In a combined washing and wringing machine, a suitable suds box or cylinder, a slidable tubular shaft located within the box or cylinder, suitable heads supported upon the tubular shaft and connected with each other, one of said heads rigidly connected to the shaft and carried thereby in its longitudinal movement, a rotatable driving-shaft extending through the tubular shaft and engaging therewith whereby a sliding and a rotating motion is imparted to said tubular shaft, substantially as and for the purpose set forth.

2. In a combined washing and wringing machine, a rotatable horizontal driving-shaft, a suitable suds box or cylinder through which the shaft extends, a slidable tubular threaded shaft located within the suds box or cylinder, a worm upon the driving-shaft engaging the threads of the tubular shaft, suitable heads located within the suds box or cylinder and connected by guide-rods, one of said heads being rigidly connected

to the slidable tubular threaded shaft and carried thereby, substantially as and for the purpose specified.



704,935. PAPER-FILE. EDGARD W. SAENGERET, Hankow, China. Filed Feb. 17, 1902. Serial No. 94,462. (No model.)

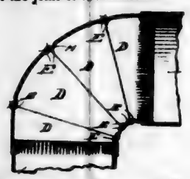
Claim.—1. A paper-file comprising two bars or rods, screws having rotary connection with one of the bars, and plates on the other of the bars and having tapped openings to receive the screws, the ends of the screws being made angular to receive a key the said ends being also pointed to puncture paper, substantially as specified.

2. A paper-file, comprising two bars, a plate connected to one of the bars, a screw having swivel connection with said plate, a plate secured to the other of the bars and having a tapped opening to receive the screw, the said other bar also having an outward opening into which the screw may pass, the screw end being angular and pointed, and a key for engaging said angular portion of the screw, substantially as specified.

3. A paper-file comprising two bars or rods, a plate attached to one of the bars or rods, a fastening-screw extended through an opening in said plate, a screw in the bar against which the head of the first-named screw engages, a plate attached to the other bar and having a tapped opening to receive the adjusting-screw, the said other bar also having an opening to receive the screw, and a key for engaging with the screw, substantially as specified.

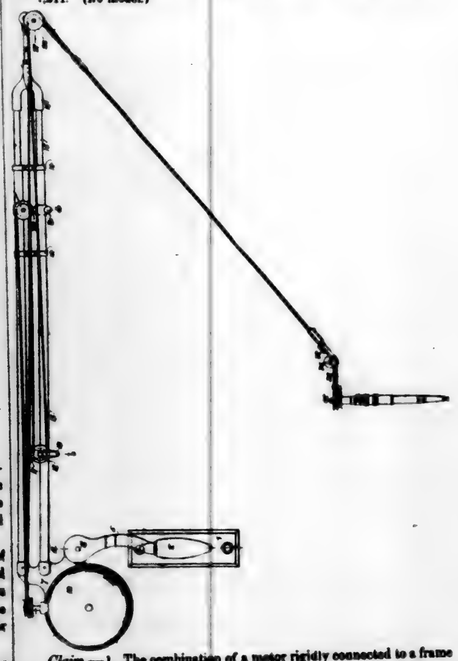
704,936. ADJUSTABLE PIPE-ELBOW AND FASTENING MEANS THEREFOR. ALBERT G. SCHERER, Chicago, Ill. Filed Aug 3, 1901. Serial No. 70,712. (No model.)

Claim.—1. A stovepipe-elbow consisting of a series of substantially the same shaped sections each of which is provided with an annular upturned edge which is at right angles to the body of the section, and an annular groove provided in the body near the edge, said upturned edges of the section being adapted to lie flush together; and the split band substantially U-shaped in cross-section adapted to have its edges fit in the annular grooves of the section so that the groove portion of band will span the joint of the upturned edges; and two right-angled clamps or brackets, secured to the ends of the joints and adapted to be brought together to clamp the joint at the joint of the sections.



2. A section for a stovepipe-elbow, comprising a band substantially circular in cross-section and having its upper and lower edges converging so as to make the band higher on one side than the opposite side, said band being provided with a depressed groove in the body of the section parallel with the edges, and having upon each edge an outwardly-projecting rim, said rims' edges being flush with the outer surface of the section, substantially as specified.

704,937. DENTAL ENGINE. ADOLPH W. SCHRADER, Philadelphia, Pa., assignor to the Electro Dental Manufacturing Company, Camden, N. J., a Corporation of New Jersey. Filed Mar. 3, 1900. Serial No. 7,211. (No model.)



Claim.—1. The combination of a motor rigidly connected to a frame carrying operating mechanism, a support connected to said parts by a pivot allowing rotation of the same around a vertical axis, said axis passing between the centers of gravity of the motor and of the frame and its attached parts, substantially as described.

2. The combination of a motor rigidly connected to a frame carrying operating mechanism, a support connected to said parts by a pivot allowing rotation of the same around a vertical axis, a member connecting the motor and frame with the said support, the same being connected thereto by a horizontal pivot permitting motion of said parts in a vertical plane, both the said pivots being between the centers of gravity of the motor and of the frame, substantially as described.

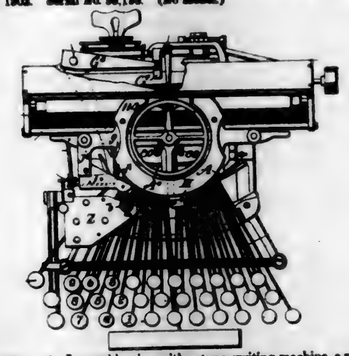
3. The combination of a support, a frame pivoted thereto, and a motor carried by the frame, said support including a yoke through which said motor is free to swing, substantially as described.

4. The combination of a yoke having supporting means permitting motion around a vertical axis, a motor and frame connected to said yoke by a pivotal joint, means for imparting friction to said joint and thereby retaining the motor with its attached frame in any desired position, substantially as described.

5. The combination of a pivotal frame, a post to which the same is pivoted, a vertical socket and a rigid sleeve and elastic cushion interposed between said post and the socket, substantially as described.

6. In a device of the character described, the combination of a frame a plate pivotally carried thereby, a handpiece attached to said plate, mechanism, including a pulley, for operating a tool carried by said handpiece, and other pulleys carried on the plate, the latter pulleys being placed on said plate relatively to the pulley of the operating mechanism so that the distance from a fixed point on the frame around the pulleys on the plate to the pulley of the operating mechanism will remain substantially constant irrespective of the relative positions of the said handpiece, the plate and the frame, substantially as described.

704,938. ADDING-MACHINE. ALEXANDER G. SCHUMAN, Louisville, Ky., assignor to Spalding Coleman, Louisville, Ky. Filed Mar. 20, 1902. Serial No. 99,199. (No model.)



Claim.—1. In combination with a type-writing machine, a registering mechanism mounted in a movable support beside the type-writing machine, and a vibrating actuating device therefor operated by and from the ordinary numeral-keys of the type-writer, and adapted to engage the registering mechanism on one stroke and to be disengaged therefrom at the end of such stroke and during its return movement, substantially as described.

2. In combination with a type-writing machine, and a laterally-swinging and longitudinally-vibrating segment actuated from the numeral key-bars thereof, with an adding mechanism composed of a series of axially-alined registering-wheels, and means for bringing said wheels into position to be engaged by the segment, substantially as described.

3. In combination with a type-writing machine, a series of registering-wheels mounted in a movable support beside the same, and a swinging and reciprocating actuating device operated by the numeral-keys of the type-writing machine adapted to operate the registering-wheels on one stroke and be disengaged therefrom during its return stroke, said registering-wheels being bodily movable into or out of operative position at the will of the operator, substantially as described.

4. In combination with a "Hammond" type-writing machine having a vibrating driver-arm, a series of registering-wheels mounted in a movable support beside the type-writing machine, and a vibrating actuating device operated by and from the "driver-arm" of the machine adapted to engage any of the register-wheels at the will of the operator.

5. In combination with a type-writing machine, a series of registering-wheels mounted in a movable support beside the type-writing machine, a vibrating segment and actuating-key connections adapted to cause said segment to engage a register-wheel when a numeral-key is depressed and to disengage such wheel at the end of its forward stroke, substantially as described.

6. In combination with a type-writing machine, an adding mechanism comprising a series of registering-wheels mounted in a movable support, a single vibrating actuating device actuated from the ordinary numeral-keys of the type-writing machine, adapted to engage a registering-wheel on one stroke and to be disengaged therefrom before and during its return stroke, said support being movable at the will of the operator to bring any registering-wheel into engagement with the actuating device.

7. In combination a series of registering-wheels mounted in a vertically-movable support, and an actuating device adapted to operate the registering-wheels successively as the support rises, and means for resetting the wheels to "zero position" when the support is depressed.

8. In combination with a type-writing machine, a series of registering-wheels mounted in a vertically-movable support, and an actuating device operated by the numeral-keys of the type-writer adapted to operate the registering-wheels successively as the support rises, and means for resetting the wheels to "zero position" when the support is depressed.

9. In combination a series of registering-wheels mounted in a vertically-movable support, an actuating device adapted to engage and operate the disks successively, means for moving the support, and an escapement mechanism whereby the support is raised one step each time the actuating device is operated.

10. In combination a series of registering-wheels mounted in a movable support, an actuating device adapted to engage and operate the disks successively, means for moving the support past said device, and an escapement mechanism whereby the support is permitted to move one step each time the segment-actuating device is operated until the registration is finished, and means for automatically resetting the disks upon and during the return movement of the registering-wheels.

11. In combination with a type-writing machine, a series of registering-wheels mounted on a movable support, a swinging and reciprocating actuating device adapted to successively engage the registering-wheels, said device being operated from the ordinary numeral-wheels of the type-writing machine, and an escapement mechanism controlling the registering movements of said support; with means for resetting the registering-wheels each time the support is retracted, said registering mechanism being movable into or out of operative position at the will of the operator.

12. In combination with a type-writing machine, an adding mechanism adapted to be actuated by and from the ordinary numeral-key levers of the type-writing machine, and means for moving said adding mechanism into or out of operative position; with mechanism whereby upon the movement of the adding mechanism to operative position the type-writing carriage is simultaneously released and caused to move toward tabulating position, substantially as described.

13. In combination with a type-writing machine, a series of registering-wheels mounted in a movable support beside the same and independent thereof, and an actuating device operated by the numeral-keys of the type-writing machine adapted to operate the registering-wheels, said registering-wheels being bodily movable into or out of operative position at the will of the operator; with mechanism whereby when the registering-wheels are moved to operative position the type-writer carriage is automatically and simultaneously released and shifted toward tabulating position, substantially as described.

14. In combination with a type-writing machine, a series of registering-wheels mounted in a movable support beside the same, and an actuating device operated by the numeral-keys of the type-writing machine adapted to operate the registering-wheels, said registering-wheels being bodily movable into or out of operative position at the will of the operator, and mechanism actuated by the support whereby when the latter is depressed the type-writer carriage is released and to move toward tabulating position, substantially as described.

15. In combination with a type-writing machine, a series of registering-wheels mounted in a vertically-movable support, and an actuating device operated by the numeral-keys of the type-writer adapted to operate the registering-wheels successively as the support rises, and means for resetting the wheels to "zero position" when the support is depressed; and mechanism whereby when the registering-wheels are moved to operative position the type-writer-carriage escapement is simultaneously operated to move the carriage toward tabulating position, substantially as described.

16. In combination with a type-writing machine, a series of registering-wheels mounted in a vertically-movable support, and an actuating device operated by the numeral-keys of the type-writer adapted to operate the registering-wheels successively as the support rises, and means for resetting the wheels to "zero position" when the support is depressed, and mechanism connected with and actuated by the support whereby when the latter is depressed the type-writer carriage is permitted to move toward tabulating position, substantially as described.

17. In combination with a type-writing machine, a movable frame thereon carrying registering-wheels and a device actuated by the numeral-keys of the type-writing machine adapted to operate the registering-wheels; with an escapement mechanism controlling the movement of the registering-frame and comprising a fixed and movable ratchet, a vibrating dog engaging the ratchets alternately, an oscillating lever and connections for actuating said lever by and from the type-writer escapement mechanism, substantially as described.

18. In an adding-machine, the combination of a movable frame, a series of registering-wheels mounted therein, a series of carry-over levers in the frame beside the registering-wheels, a rotary shaft journaled in the frame and provided with arms adapted to actuate any displaced carry-over levers, and mechanism for rotating said shaft when the frame is depressed, substantially as described.

19. In an adding-machine, the combination of a vertically-movable frame, a series of registering-wheels therein, a series of carry-over levers beside the registering-wheels, a rotary shaft journaled in the frame and having arms adapted to engage displaced carry-over levers and spiral threads and means engaging the threads for causing the rotation of said shaft when the frame is depressed, substantially as described.

20. The combination with a type-writing machine, of a vibrating lever adapted to be actuated by the type-writing machine pusher-arms when the numeral-keys are depressed, and a segment pivotally attached to said lever; registering-wheels mounted in a movable support beside the vibrating segment, and means for throwing the segment into and out of mesh with the registering-wheels, substantially as described.

21. The combination with a type-writing machine, of a vibrating lever adapted to be actuated by the numeral-keys of the type-writing machine, a toothed segment pivoted to said lever, a support for the other end of the lever, a registering-wheel beside the segment, and means for moving said support so as to throw the segment into and out of mesh with the registering-wheels, substantially as described.

22. The combination with a type-writing machine of a vibrating lever adapted to be actuated by the numeral-keys of the type-writing machine, a toothed segment pivoted to said lever, a pivoted plate supporting the other end of the lever, a series of registering-wheels beside the segment, and means for rocking said plate so as to throw the segment properly into and out of mesh with the registering-wheels, substantially as described.

23. The combination with a type-writing machine, of a vibrating lever adapted to be actuated by the numeral-keys of the type-writing machine, a toothed segment pivoted to said lever, a support for the other end of the lever, a registering-wheel beside the segment, and means for moving said support so as to throw the segment into and out of mesh with the registering-wheels; with means for imparting a step-by-step movement to the series of register-wheels so as to bring them successively into position to mesh with the segment substantially as described, and means for resetting the registering-wheels to zero, substantially as described.

24. The combination with a type-writing machine, of a vibrating lever adapted to be actuated by the numeral-keys of the type-writing machine, a toothed segment pivoted to said lever, a pivoted plate supporting the other end of the lever, a series of registering-wheels beside the segment and means for rocking said plate so as to throw the segment properly into and out of mesh with the registering-wheels; with means for imparting a step-by-step movement to the series of registering-wheels so as to bring them successively into position to mesh with the segment, substantially as described, and means for resetting the registering-wheels to zero, substantially as described.

25. The combination with a type-writing machine, of a vibrating lever actuated by the numeral-keys of the type-writing machine, a toothed segment pivoted to said lever, a support for the other end of the lever, and means for moving said support so as to throw the segment into and out of mesh with the registering-wheels, a movable frame beside the segment, a series of registering-wheels in the frame, mechanism for moving the frame so as to bring the registering-wheels successively into position to be engaged by the segment, and means for "carrying over" when the frame is depressed, substantially as described.

26. The combination with a type-writing machine, of a vibrating lever actuated by the numeral-keys of the type-writing machine, a toothed segment pivoted to said lever, a pivoted plate supporting the other end of the lever, and mechanism for rocking said plate so as to throw the segment into and out of mesh with the registering-wheels, a movable frame beside the segment, a series of registering-wheels in the frame, mechanism for moving the frame upward step by step so as to bring the registering-wheels successively into position to be engaged by the segment, and means for causing the registering-wheels to "carry over" when the frame is depressed, substantially as described.

27. In combination with a type-writing machine, a movable series of registering-wheels, carry-over levers for actuating one wheel from another, a resetting-shaft provided with arms adapted to engage any displaced carry-over lever mechanism for rotating said shaft, and mechanism, actuated by and from the carriage escapement mechanism for moving said series of registering-wheels during the adding operation, a vibrating lever actuated by and from the numeral-keys of the type-writing machine, a segment pivoted to said lever and adapted to engage the registering-wheels, a movable support for the free end of said lever, and means, actuated by and from the numeral-keys of the type-writing machine for moving said support to throw the segment into mesh, and mechanism for throwing the segment out of mesh at the proper time, substantially as described.

28. In combination with a type-writing machine, a movable frame connected therewith, a series of registering-wheels mounted in said frame, carry-over levers for actuating one wheel from another, a resetting-shaft provided with arms adapted to engage any displaced carry-over lever, mechanism for rotating said shaft upon the depression of the frame, mechanism, actuated by and from the carriage escapement mechanism for moving said adding-frame step by step during the adding operations, a vibrating lever actuated by and from the numeral-keys of the type-writing machine, a segment pivoted to said lever and adapted to engage the registering-wheels, a vibrating plate supporting the free end of said lever, means actuated by and from the numeral-keys of the type-writing machine for rocking said plate to throw the segment into mesh, and mechanism for throwing the segment out of mesh at the proper time, all substantially as set forth.

29. In combination with a type-writing machine having a vibrating "driver-arm" for actuating its type-shuttle; a series of registering-wheels mounted on a movable support, an actuating device adapted to successively engage the registering-wheels, said device being operated from and by the "driver-arm," and an escapement mechanism controlling the registering movements of said support.

30. The combination of a movable frame carrying registering-wheels, and a vibrating actuating device beside the frame adapted to engage the several registering-wheels successively; with an escapement mechanism for controlling the movement of the frame, composed of a fixed and movable ratchet and a dog mounted on a vibrating support, a key and connections for actuating the escapement mechanism, and numeral-keys and connections for simultaneously operating the actuating device and escapement mechanism, substantially as described.

31. In combination of a "type-shuttle" type-writing machine having a vibrating "driver-arm," a movable frame carrying registering-wheels, and a device actuated by the "driver-arm" adapted to operate the registering-wheels; with an escapement mechanism controlling the movement of the registering-frame and actuated by and from the type-writer escapement, substantially as described.

704,939. COMPOSITION FOR OILING FIBER AND PROCESS OF MAKING SAME. CARLO BELLA, Biella, Italy. Filed Apr. 24, 1901. Serial No. 57,250. (No specimens.)

Claim.—1. A solution of soda soap of castor-oil in olein substantially in the proportions and for the purpose specified.

2. A solution of soda soap of castor-oil in olein treated with pure water substantially in the proportions and for the purpose specified.

3. The process described consisting in dissolving soda soap of castor-oil in olein, adding water or water and glycerin to this solution while agitating it, and subsequently adding pure water substantially in the proportions and for the purpose specified.

704,940. TROUSERS CLAMP AND HANGER. GEORGE W. SHELTON, Morrill, Kans. Filed May 25, 1901. Serial No. 61,919. (No model.)

Claim.—A garment-hanger comprising two plates each provided at both ends with a pair of cord-openings located one above the other, the openings of one plate registering with the openings in the other plate, and a single continuous cord forming two suspending-loops extending through the lower openings of both plates and upward transversely of the boards and crossed through the upper openings of both plates.

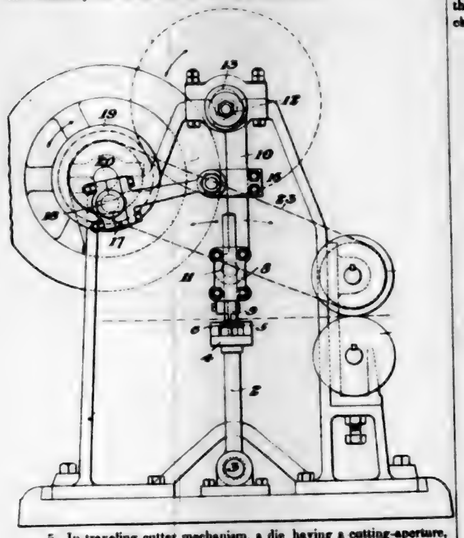
704,941. TRAVELING CUTTER MECHANISM. EDWIN E. SLICK, Pittsburg, Pa. Filed Feb. 1, 1902. Serial No. 92,162. (No model.)

Claim.—1. In apparatus for cutting traveling strips, a pair of cutters, movable supports therefor, crank mechanism arranged to impart a back-and-forth movement to both of said cutter-supports, and mechanical connections arranged to reciprocate at least one of the cutters, substantially as described.

2. In apparatus for cutting traveling strips, a pair of cutters, mechanism for oscillating both of said cutters at the same rate of speed as the strip, and separate power-actuated connections for reciprocating at least one of the cutters during this movement; substantially as described.

3. In apparatus for cutting traveling strips, a pair of cutters, supporting mechanism for imparting a back-and-forth movement to the cutters, and mechanism for reciprocating at least one of the cutters at intervals of more than one double stroke; substantially as described.

4. In traveling cutter mechanism, a fixed cutter mounted on an oscillatory carrier, connections arranged to oscillate said carrier, a traveling cutter secured to a carrier loosely guided on the oscillatory carrier, a swinging arm pivoted to the traveling cutter-carrier, mechanism for swinging the said arm, and mechanism for reciprocating the movable cutter during the oscillatory movement; substantially as described.



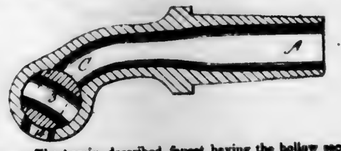
5. In traveling cutter mechanism, a die having a cutting-aperture, a cutter-die arranged to enter the aperture, mechanism for oscillating both of said dies at the speed of the traveling strip, and mechanism for simultaneously reciprocating at least one of said dies; substantially as described.

6. In traveling punch mechanism, a die mounted on an oscillatory carrier, a cross-head sliding on said carrier and having a movable die, an eccentric-rod pivoted to the cross-head, and mechanism for oscillating the eccentric-rod and actuating the eccentric; substantially as described.

7. In traveling cutter mechanism, a pair of cutters, mechanism for oscillating said cutters, and mechanism for reciprocating one of the cutters, the said reciprocating mechanism operating at intervals greater than each double oscillation; substantially as described.

8. In cutter mechanism, a pair of traveling cutters, mechanism arranged to impart a back-and-forth movement to both of said cutters at the speed of the traveling strip, and mechanism arranged to reciprocate one of the cutters; substantially as described.

704,942. OIL OR MOLASSES FAUCET. CHARLES F. SMITH, New Britain, Conn., assignor to Landers, Frary and Clark, New Britain, Conn. Filed Mar. 2, 1901. Serial No. 49,581. (No model.)

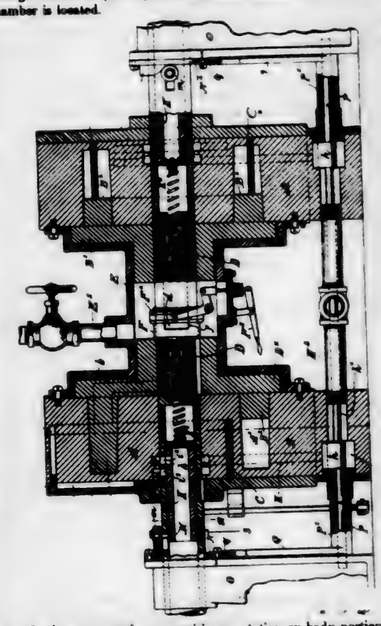


Claim.—The herein-described faucet having the hollow securing-stem A, the curved neck 6 of an oval form extending outwardly and downwardly from the said stem, a horizontally-depending head or barrel B, with a delivery-opening 14 elongated in the line of the barrel at both its influent and effluent ends, the effluent end terminating in the circular outer wall of the said barrel and an opening and closing plug C within the said barrel, substantially as described.

704,943. ROTARY MOTOR. DANIEL F. SMITH, New York, N. Y. Filed June 7, 1902. Serial No. 110,630. (No model.)

Claim.—1. A rotary engine comprising a piston traveling in an annular steam or pressure chamber and a movable abutment-ring eccentrically disposed so as to divide the piston-chamber into two parts and within which the axis of the piston-chamber is located, the abutment-ring and piston being so constructed and operated that the piston may pass across the ring at the required point.

2. A rotary engine comprising an annular pressure piston-chamber, a piston traveling therein, and a rotating eccentrically-disposed abutment-ring intersecting said chamber at two points and formed with a notch through which the piston passes, and within which the axis of the piston-chamber is located.



3. A rotary engine comprising a stationary body portion having therein an annular piston-chamber with converging side walls, a piston-carrying member having a correspondingly-tapered piston extending to the bottom of said chamber and a correspondingly-tapered flange extending partly into the chamber, an eccentrically-disposed notched abutment-ring traveling in a seat or bearing in the body portion and intersecting said chamber at two points, and means for rotating the abutment-ring in proper unison with the piston.

4. A rotary engine comprising a body-piece having an annular piston-chamber, a piston-carrying member having a piston occupying said chamber and a flange part closing the chamber and a notched eccentrically-disposed abutment-ring traveling in a seat in the body part and held in position by the face of the flange on the piston member and within which the axis of the piston-chamber is located, and means for rotating the abutment-ring in unison with the movement of the piston for the purpose described.

704,944. COMPOUND LUMBER. SETH H. SMITH, Hillsdale, Mich. Filed Dec. 5, 1901. Serial No. 84,833. (No model.)

Claim.—1. In an article of the class described, the combination with wooden sheets placed together with the grain of the wood disposed in intersecting planes, of a continuous line of fastening means passing through the sheets and securing them together, said fastening means extending in continuous lines along the outer faces of both sheets.

2. In an article of the class described, the combination with wooden sheets placed together with the grain of the wood disposed in intersecting planes, of a continuous line of fastening means passing through the sheets and securing them together, portions of said line of fastening means intersecting the grain of the wood of both sheets.

3. In an article of the class described, the combination with wooden sheets placed together with the grain of the wood disposed in intersecting planes, of a binder stitched through the sheets to secure them together, said binder extending in continuous lines over the outer faces of both sheets.

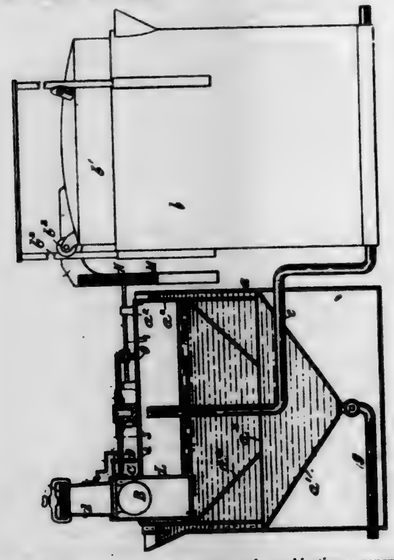
4. In an article of the class described, the combination with wooden sheets placed together with the grain of the wood disposed in intersecting planes, of a binder passing through the sheets and comprising a line of stitching, said line intersecting the grain of the wood of both sheets.

5. In compound lumber, circular sheets of veneer placed together with the grain of the wood disposed in intersecting planes, and a binder passing through the sheets and comprising a circular line of stitching that extends entirely around the lumber contiguous to the periphery thereof.

6. In compound lumber, facing sheets of veneer placed together with the grain of the wood disposed in intersecting planes, an intermediate strengthening-sheet located between the facing sheets and terminating short of the side edges thereof, and fastening devices passing through the facing sheets to fasten their edges together over the strengthening-sheet.

7. In compound lumber, a series of sheets of veneer placed together with the grain of the wood disposed in intersecting planes, and a binder passing through the sheets and comprising a circular line of stitching which intersects the grain of the wood of the several sheets.

704,945. ACETYLENE-GAS GENERATOR. CARL W. SÖDERBERG, Nordstrand, near Christiania, Norway. Filed July 11, 1899. Serial No. 723,488. (No model.)

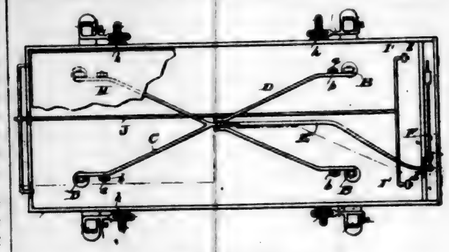


Claim.—In an acetylene-gas generator in combination, a generator-chamber, a fixed top or cover for the same, a circular row of fixed tubes passing through the said fixed top and dipping into the water of the generator-chamber, carbid-receptacles of less diameter than the said fixed tubes mounted on top of each tube and provided with air-tight covers at the top, throttle-valves mounted within said tubes and forming movable bottoms for the said receptacles, operating-shafts for holding the said bottoms up against the shoulders formed between the tubes and the receptacles, said operating-shafts having their operative ends placed outside the generator-chamber and means for operating the shafts substantially as described.

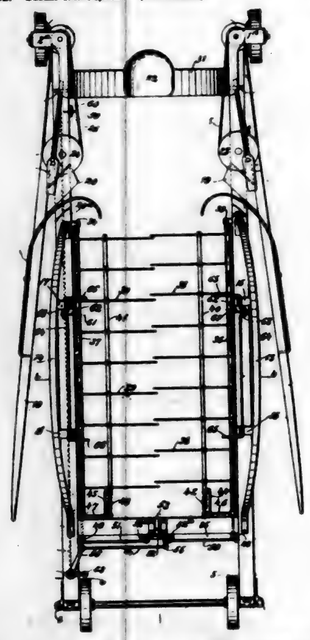
704,946. COMBINATION VEHICLE AND STATIONARY SCALE. LOUIS H. SOHR, St. Cloud, Wis. Filed Apr. 19, 1901. Serial No. 56,547. (No model.)

Claim.—1. In a combination portable and stationary scale having a rectangular box inclosing the latter, and interposed between the bolsters of a vehicle running-gear and the body thereof, adjustable brackets secured to the sides of said box and means for attaching the brackets to the bolster-stakes, when the scale-box is in position upon the vehicle running-gear, substantially as set forth.

2. In a combination portable and stationary scale having a rectangular box inclosing the latter, and interposed between the bolsters of a vehicle running-gear and the body thereof, a floor for said box upon which the body rests, bolts for locking said floor and box together whereby the former is rigid when the scale is not in use, adjustable brackets secured to the sides of the box, and means for detachably connecting the brackets to the bolster-stakes of a vehicle running-gear when the scale-box is in position upon the bolsters thereof, substantially as set forth.



704,947. CORN-HARVESTER. HENRY R. SPANT and ALBERT W SPANT, Pattonsburg, and GUSTAVE SPANT, King City, Mo. Filed Feb. 19, 1902. Serial No. 94,745. (No model.)

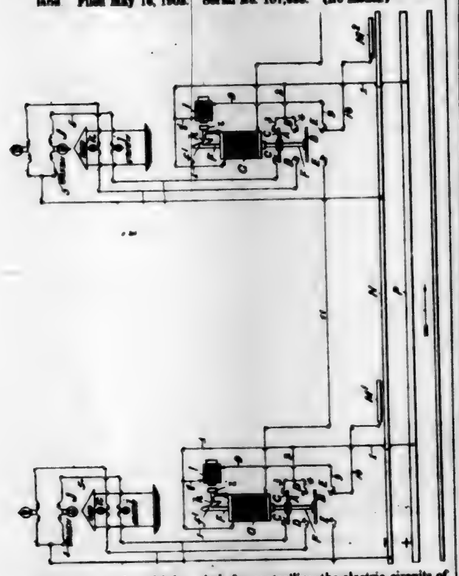


Claim.—1. A corn-harvester comprising a movable frame adapted to travel between rows of corn and provided with an arch for supporting a seat, means for severing stalks located upon both sides of said frame and for guiding the fall of said stalks, racks loosely mounted upon said frame and forming a tentative support disposed centrally thereof, said racks comprising fingers normally free to move radially downward for the purpose of dumping said stalks centrally of said frame and free to swing obliquely backward when engaged by the ground, means controllable at will for swinging said fingers radially downward, and means for automatically moving said fingers forward when the same are free from the ground.

2. A corn-harvester comprising a movable frame adapted to travel between corn-rows and provided with an arch for supporting a seat, means for severing cornstalks located upon both sides of said frame, and for guiding the fall of said stalks when severed, racks loosely mounted upon said frame and forming a tentative support disposed centrally thereof, said racks comprising fingers normally free to move radially downward for the purpose of dumping said stalks centrally of said frame, and free to swing obliquely backward when engaged by the ground, mechanism controllable at will for swinging said fingers radially downward, and means for automatically moving said fingers forward when the same are free from the ground, hooks for tentatively holding any stalks which

may be severed while the racks are dumping, and links connected with said racks and said hooks for actuating said hooks.

704,948. AUTOMATIC ELECTRICAL SIGNALING APPARATUS FOR RAILWAYS. JAMES R. SPAGNOLETTI, London, England, assignor to the Electric Railway Signalling Syndicate, Limited, London, England. Filed May 16, 1902. Serial No. 107,633. (No model.)



Claim.—1. A multiple switch for controlling the electric circuits of railway-signals, and consisting of a plurality of bridging contact-pieces carried by a vertically-guided rod adapted to be moved by gravity in the one, and by electromagnetic attraction in the other direction, pairs of contacts respectively connected to the members of the circuits to be controlled by the switch, electromagnetic means for raising the said rod contact-pieces so as to thereby cause bridging contact to be established between one pair of contacts, means of latching the rod in the raised position, and electromagnetic means of releasing the latching device so as to permit the rod and contact pieces carried thereby to fall and cause bridging contact to be broken between the one pair of contacts and to be established between the contacts of the other pairs.

2. A multiple switch for controlling the electric circuits of railway-signals, and consisting of a plurality of bridging contact-pieces carried by a vertically-guided rod, a solenoid the movable core of which is carried upon the said rod, a collar on the upper end of the said rod, a spring-actuated latch adapted for engagement with the collar so as to retain the rod in the raised position, and an electromagnet whereof the armature is connected to the latch so as to cause the latch to be retracted when the armature is attracted by the magnet.

704,949. GRAIN-DOOR. ALVA T. STARR, Geneva, N. Y. Filed Feb. 21, 1902. Serial No. 95,066. (No model.)

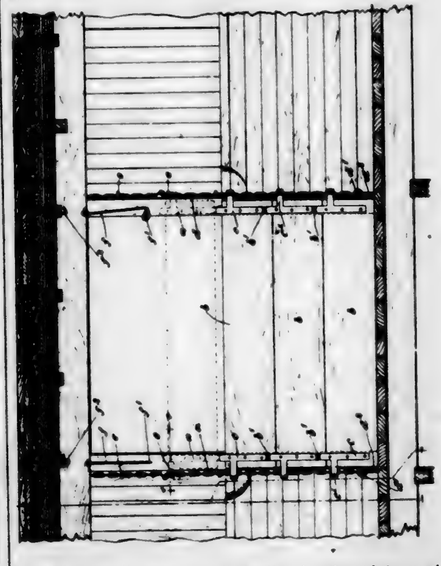
Claim.—1. A grain-door, comprising a door-section, a chain or other flexible structure mounted on the car, on which chain the door-section is adjustably carried, and means for releasably holding the chain taut.

2. A grain-door, comprising a door-section, a chain or other flexible structure mounted on the car, on which chain the door-section is carried, said chain extending alongside of the door, means for removably attaching the lower end of the chain to the car, and means for holding the door-section raised against the roof of the car.

3. A grain-door, comprising a plurality of door-sections, chains or other flexible structures mounted on the car at the sides of the door-opening, with which chains the door-sections have sliding connection, and means for releasably holding the chains taut.

4. A grain-door, comprising a door-section, a chain or other flexible structure mounted on the car, adjacent to the door-opening, with which chain the door-sections have sliding connection, a hook fastened to the lower part of the car releasably to hold the lower end of the chain, and means for holding the door-sections raised to the roof of the car.

5. A grain-door, comprising a plurality of sections, chains or other flexible structures with which the door-sections have sliding connection, said chains having their upper ends fastened permanently to the car and their lower ends removably connected thereto, and means adjacent to the roof of the car for holding the door-sections raised.



6. A grain-door, comprising a plurality of sections, chains or other flexible structures with which the door-sections have sliding connection, said chains having their upper ends fastened permanently to the car and their lower ends removably connected thereto, and means adjacent to the roof of the car for holding the door-sections raised, said means comprising an arm mounted to swing on the car and a hook in the roof of the car to be engaged by the arm.

7. A grain-door comprising a plurality of sections adapted to lie one above the other to form a complete door, chains or other flexible structures located one at each side of the door and having the door-sections independently slidable thereon, and means for varying the tension of the chains.

8. A grain-door, comprising a plurality of sections adapted to lie one above the other to form a complete door, chains or other flexible structures located one at each side of the door and having the door-sections independently slidable thereon, and means for holding the chains taut, said means comprising hooks fastened to the door-posts and adapted to have the chain drawn under one and engaged with the other.

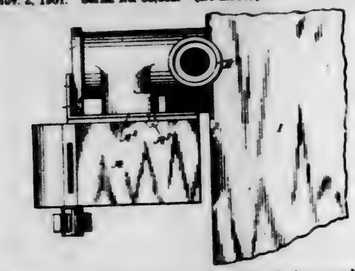
9. A grain-door, comprising a plurality of sections adapted to lie one above the other to form a complete door, chains or other flexible structures located one at each side of the door and having the door-sections independently slidable thereon, means for holding the chains taut, said chains being permanently fastened at their upper ends and removably engaged with the car at their lower ends, and means at the top of the door for holding the door-sections raised, when desired.

10. A grain-door, comprising door-sections adapted to lie one above the other and having grooves therein, and lock-plates fitted in the grooves and projected beyond the sections, whereby said projected portions may be entered into the grooves of the adjacent sections.

11. A grain-door, comprising door-sections adapted to lie one above the other, lock-plates fastened to the door-sections and projected beyond the sections to receive between them the adjacent door-sections, guide-eyes attached to the lock-plates and projecting from the ends of the door-sections, and means loosely received in said guide-eyes, whereby to carry the door-sections.

12. A grain-door, comprising door-sections adapted to lie one above the other, lock-plates fastened to the door-sections and projected beyond the sections to receive between them the adjacent door-sections, guide-eyes attached to the lock-plates and projecting from the ends of the door-sections, means loosely received in said guide-eyes, whereby to carry the door-sections, said means consisting in chains located one at each side of the door, and means for removably holding the chains taut

704,950. **VALVE MECHANISM FOR COIN-CONTROLLED GAS-VENDING MACHINES.** WILLIAM J. SPROUL, Brooklyn, N. Y. Filed Nov. 2, 1901. Serial No. 80,382. (No model.)



Claim.—1. A valve mechanism for coin-controlled gas-vending machines, comprising a valve-body having a gas-passage and adapted for connection at one end with a gas-supply pipe and at the other end with a meter, the said valve-body being provided with two valve-seats, a stem carrying a valve formed with two faces, the valve being located between the valve-seats, and the valve and valve-seats being in the gas-passage, the said valve-seats being formed with bearings for the stem to slide in, a spring coiled on the stem at one side of the valve and resting with one end on one of said bearings, the other end pressing on the valve to hold the same normally to its seat, a pin or screw secured to the other end of the valve-stem, a rock-shaft extending into the gas-passage, an arm arranged on the inner end of the rock-shaft within the gas-passage and having a fork at its free end engaging the said pin, and a coin-controlled mechanism for actuating the said arm to move the valve to open position against the tension of the spring, as set forth.

2. A valve mechanism for coin-controlled gas-vending machines, having a valve-body connected at one end with a gas-supply pipe and at the other end with a meter, a valve in the said valve-body, a coin-controlled mechanism for opening the said valve, and a cap on the said valve-body opposite the valve-seat and having an offset on its periphery abutting against the casing of the said coin-controlled mechanism, as set forth.

3. A valve mechanism for coin-controlled gas-vending machines, having a valve-body connected at one end with a gas-supply pipe and at the other end with a meter, a valve in the said valve-body, a coin-controlled mechanism for opening the said valve, a cap screwing into the said valve-body and having an offset on its periphery abutting against the casing of the said coin-controlled mechanism, and means for securing the said casing to the said valve-body from the inside of the casing, as set forth.

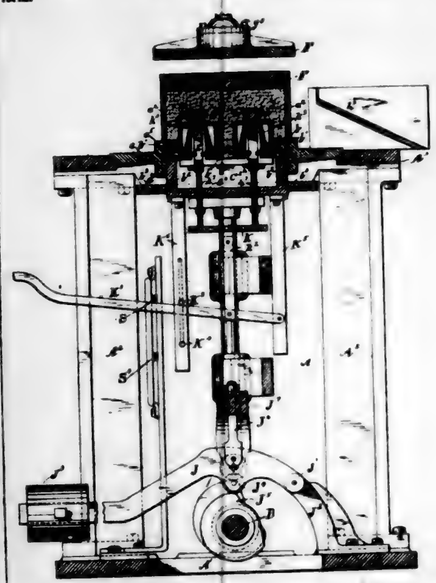
4. A valve mechanism for coin-controlled gas-vending machines, having a valve-body connected at one end with a gas-supply pipe and at the other end with a meter, a valve in the said valve-body, a coin-controlled mechanism for opening the said valve, a cap on the said valve body and having an offset abutting against the casing of the said coin controlled mechanism, and an angular flange on the said casing and projecting in front of the cap, as set forth.

5. A valve mechanism for coin-controlled gas-vending machines, having a valve-body connected at one end with a gas-supply pipe and at the other end with a meter, a valve in the said body, a coin-controlled mechanism for opening the said valve, a cap on the said valve-body and having an offset abutting against the back plate of the casing of said coin-controlled mechanism, the said back plate being provided with an angular flange projecting in front of the cap, and means for securing the said casing to the said valve-body from the inside of the casing, as set forth.

6. A valve mechanism for coin-controlled gas-vending machines, comprising a valve-body having a gas-passage formed therein, a cylindrical seat-body fitting in the gas-passage, and having its bore enlarged at its middle portion, the said cylindrical seat-body being provided with two valve-seats at the enlarged portion, and a bearing at each end, a valve-stem having its ends arranged to slide in the said bearings, a valve formed with two faces and carried by said stem, the valve being arranged in the enlarged portion of the bore of the cylindrical seat-body between the valve-seats, coin-controlled means for moving the valve into an open position, and a spring for holding the valve normally to its seat, the said spring pressing at one end on one face of the valve and engaging with its other end one of said bearings, as set forth.

704,951. **APPARATUS FOR FORMING SAND MOLDS.** STEPHEN J. ADAMS, Pittsburg, Pa., assignor to Marcellus C. Adams, Pittsburg, Pa. Filed May 11, 1901. Serial No. 610,246. (No model.)

Claim.—1. The combination with a table, of a flask or sand-holder resting thereon and a cutter having an irregular edge and adapted to slide over the sand-holder and cut or plane off the sand corresponding to said irregular edge, and a guideway supported on the table and in line with the flask edge to support the cutter in its movement, substantially as set forth.



2. The combination with a flask or sand-holder having an irregular edge portion, of a cutter having an irregular edge corresponding to such edge portion and adapted to slide over the sand-holder and cut or plane off the sand corresponding to the edge thereof, substantially as set forth.

3. In sand-molding apparatus, the combination with a flask or sand-holder of irregular shape, of a sand-reservoir corresponding in shape to the sand-holder and sliding over the same so as to cut or plane off the sand to the shape of the flask, substantially as set forth.

4. The combination with a flask or sand-holder having an irregular edge, of a cutter having an irregular edge corresponding in shape to that edge, and having guides to hold it in line with the sand-holder said cutter adapted to slide over said flask and cut or plane off the sand to the shape of the edge thereof, substantially as set forth.

5. The combination with a table, a flask or sand-holder resting thereon having an edge of irregular shape, and a cutter adapted to slide over the sand-holder and cut or plane off the sand corresponding to said irregular edge, and a guideway supported on the table and in line with the flask edge to support the cutter in its movement, substantially as set forth.

6. In combination with the molding-table, a flask having its lower edge of irregular shape, a flask-supporting plate on the table having its face corresponding to the lower edge of the flask, and a pattern adapted to be forced into the flask, substantially as set forth.

7. The combination with a table, of a flask having its upper and lower edges of irregular shape, a flask-supporting plate on the table and having its face corresponding to the lower edge of the flask, a confining-plate on the flask having its inner face corresponding to the upper edge of the flask, and a pattern adapted to be forced into the flask, substantially as set forth.

8. The combination with a table, of a flask having its lower edge of irregular shape, a flask-supporting plate on the table and having its face corresponding to the lower edge of the flask, a confining-plate on the flask, a pattern adapted to be forced into the flask, and a stripping-plate fitting around the pattern and corresponding in shape to the lower edge of the flask, substantially as set forth.

9. The combination with a table, of a flask having its upper and lower edges of irregular shape, a flask-supporting plate on the table and having its face corresponding to the lower edge of the flask, a confining-plate on the flask, having its inner face corresponding to the upper edge of the flask, a pattern adapted to be forced into the flask, and a stripping-plate fitting around the pattern and corresponding in shape to the lower edge of the flask, substantially as set forth.

10. The combination of a table, a flask having its lower edge of irregular shape, a flask-supporting plate on the table and having its face corresponding in shape to the lower edge of the flask and having a flange depending from its inner edge and forming a pocket in the reservoir, a vertically-movable stripping-plate corresponding to the lower edge of the flask and fitting within the depending flange and forming the base of the reservoir and a vertically-movable pattern extending up within said stripping-plate, substantially as set forth.

11. The combination with a supporting-frame, a hollow pattern vertically movable therein, wing-patterns pivotally mounted in the hollow pattern and extending up through the top thereof and having inwardly-projecting lugs at their lower ends, and a pattern-block having recesses into which the said lugs extend, adapted to be raised to spread the wing-patterns, and hold them in molding position and to be drawn down and contact with the lugs and draw the wing-patterns together for the withdrawal of the pattern from the mold, substantially as set forth.

12. The combination with a supporting-frame, of hollow patterns vertically movable therein and carried by a pattern-frame, wing-patterns mounted in and extending up through the top of the hollow patterns, pattern-blocks sliding within the hollow patterns and adapted to be forced between the wing-patterns, and a plate below the pattern-frame connected by bars with the pattern-blocks and connected by a strap to a lever mounted on a bar depending from the pattern-frame, substantially as set forth.

13. The combination with a supporting-frame, of a hollow pattern vertically movable therein, and carried by a pattern-frame, wing-patterns, mounted in the hollow pattern and extending up through the top thereof, a pattern-block sliding in the hollow pattern and adapted to be forced between the wing-patterns to hold them in molding position, bars depending from the pattern-frame and having a lever mounted therein, a strap connecting said pattern-block with the lever, and stops on one of said bars depending from the pattern-frame limiting the movement of the lever, substantially as set forth.

14. The combination of a main frame, a vertically-moving pattern-frame mounted therein and carrying a pattern, cam mechanism engaging with said frame and adapted to raise the same and force the pattern into the sand within the flask, a weighted withdrawing-lever connected to said pattern-frame to insure the withdrawal of the pattern from the mold, and a separate cam controlling the movement of said weighted lever, substantially as set forth.

15. The combination of a main frame having a table, a hook on the top thereof, a flask resting on the same, a pattern entering the flask from below, a top confining-plate, a swinging frame adapted to engage with the top confining-plate and having a stirrup engaging with said hook, and a rocker on the table at the end of the flask adapted to direct the same over said hook when the flask is rocked over, substantially as set forth.

16. The combination of a main frame, a table, a flask resting thereon, a pattern entering the flask, a rocker on the table to support the flask as it is rocked over, and a guard-plate adapted to be placed upon the flask and having guiding-lips to hold the flask and guard-plate in line as it is rocked over, substantially as set forth.

17. The combination of a main frame, a vertically-movable pattern carried by a pattern-frame mounted therein, an arm or lever carried by said frame, an operating-shaft controlling the driving mechanism, said shaft having a locking-arm thereon, and a locking-bar with which the arm on the pattern-frame is adapted to contact to cause such locking-bar to engage with the locking-arm on the operating-lever, substantially as set forth.

18. The combination of a main frame, a vertically-movable pattern carried by a pattern-frame mounted therein, an arm or lever carried by said frame, an operating-lever controlling the driving mechanism, said lever having a locking-arm thereon, a locking-bar pivoted on the main frame in the course of the lever on the pattern-frame and having a lip in the course of the locking-arm on the operating-shaft, and a spring holding the locking-lip on said locking-bar out of the course of the locking-arm on the operating-lever, substantially as set forth.

19. The combination with a main frame, a vertically-movable pattern mounted therein operated by power connections, a supplementary pattern on the main pattern, a lever mounted on the pattern-frame and operating the supplementary pattern by the vertical movement of the lever, a shaft controlling the driving mechanism having the locking-arm thereon, and a locking-bar engaging with said locking-arm and extending in the course of the lever carried by the pattern-frame, substantially as set forth.

20. The combination of a main frame, a vertically-movable pattern carried by a pattern-frame mounted therein, an arm or lever carried by said frame, an operating-shaft controlling the driving mechanism, said shaft having a locking-arm thereon, a locking-bar with which the arm on the pattern-frame is adapted to contact, to cause such locking-bar to engage with the locking-arm on the operating-lever, and a spring connected to the locking-bar and holding it normally out of the course of the locking-arm, substantially as set forth.

21. The combination of a main frame, a pattern-frame mounted therein and carrying a pattern, driving mechanism for imparting vertical movement to the pattern-frame, a supplementary pattern mounted in the main pattern and connected to a lever mounted in the pattern-frame, an operating-lever controlling the movement of the driving mechanism and carrying the locking-arm, and two locking-bars extending one above and the other below the lever carried by the pattern-frame and held normally out of the course of the locking-arm on the operating-lever but adapted to be thrown into such course by said lever on the pattern-frame, substantially as set forth.

22. The combination of a main frame having a cam-shaft, a pattern carried by a frame operated by the cam on said shaft, an operating-shaft controlling the driving mechanism, a knocker on the cam-shaft, and a dog carried by the operating-lever extending in the course of the knocker on the cam-shaft, substantially as set forth.

23. The combination of a main frame having a cam-shaft, a pattern carried by a frame operated by the cam on said shaft, an operating-shaft controlling the driving mechanism, a knocker on the cam-shaft, and an arm carried by the operating-shaft, said arm having a movable dog extending in the course of the knocker on the cam-shaft substantially as set forth.

24. The combination of a main frame having a cam-shaft, a pattern carried by the frame operated by the cam on said shaft, an operating-shaft controlling the driving mechanism, a knocker on the cam-shaft an arm carried by the operating-shaft, said arm having a movable dog extending in the course of the knocker on the cam-shaft, and a trigger connected to said dog and adapted to withdraw the same from the course of the knocker, substantially as set forth.

25. The combination of the main frame having a cam-shaft D mounted therein and operating one or more patterns mounted in said frame and carrying the disk R having knockers r thereon, the vertical shaft L′ having the hand-lever L, the arm l' on said shaft L′ having the dog r^2 mounted thereon, and the trigger r^4 mounted on the hand-lever L connected to the dog, and the spring r^3 holding said dog normally in the course of the knockers on the disk, substantially as set forth.

26. The combination of a main frame having a pattern mounted therein, the driving-shaft M, and operating mechanism between the same and the pattern for moving the pattern a power-driven pulley on the driving-shaft, clutch mechanism connecting said shaft and the pulley, the operating-shaft L′ carrying the arm l, the lever N connected to the clutch, the strap N′ connecting said lever and the arm l on the vertical shaft L and knocking mechanism for turning the shaft L′ and freeing the clutch, substantially as set forth.

27. The combination of the main frame having a pattern mounted therein, a cam-shaft D operating said pattern and having knockers thereon, the driving-shaft M turning the cam-shaft, a power-driven pulley on said driving-shaft and clutch mechanism between the shaft and pulley, the operating-shaft L′ connected to the clutch, and a dog carried by the operating-shaft in the course of the knockers on the cam-shaft, substantially as set forth.

28. The combination of a main frame, a pattern therein, a cam-shaft for moving said pattern, a driving-shaft turning the cam-shaft, a power-driven pulley on said driving-shaft, clutch mechanism between the pulley and the shaft, a brake operating on said driving-shaft, and an operating-shaft having connections therefrom to the clutch mechanism and to the brake for applying the clutch and releasing the brake, or vice versa, substantially as set forth.

29. The combination of a main frame, a pattern mounted therein, mechanism for operating the pattern, a driving-shaft connected to said mechanism and carrying a friction-drum, a brake operating on said friction-drum, and an operating-lever controlling the movement of the driving-shaft, and connections from said operating-lever acting to withdraw the brake from the friction-drum, substantially as set forth.

30. The combination of the driving-shaft carrying the friction-drum P′, the weighted brake-bar pivoted in the frame and carrying the brake-shoe p^3, the sliding bar p^4 extending through a guide over the forward end of the brake-bar and having an inclined face thereon for forcing down that end of the brake-bar and so raising the shoe, and the operating-shaft L′ connected to said sliding bar p^4, substantially as set forth.

31. The combination of a main frame having a pattern mounted therein, the cam-shaft operating said pattern and having a knocker thereon, a driving-shaft turning the cam-shaft, clutch mechanism connecting a power-driven pulley with said driving-shaft, braking mechanism operating on said driving-shaft, and an operating-shaft controlling said clutch mechanism and braking mechanism and having a dog in the course of the knocker on the cam-shaft, substantially as set forth.

32. The combination of a series of flasks, each adapted to stand on one of its ends on the molding-floor and in contact with each other, said flasks each having supporting-bearings on only one side of the lower end thereof so as to cause each flask to swing or press against the adjoining flask, substantially as set forth.

33. In combination with the support, a flask having its lower edge of irregular shape, a flask-supporting plate on the support, having its face corresponding to the lower edge of the flask, and a pattern adapted to be forced into the flask.

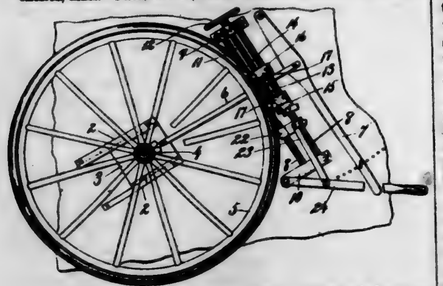
704,952. METHOD OF FORMING SAND MOLDS. STEPHEN J. ADAMS, Pittsburg, Pa., assignor to Marcellin C. Adams, Pittsburg, Pa. Original application filed May 11, 1894, Serial No. 510,848. Divided and this application filed Feb. 1, 1901. Serial No. 45,591. (No model.)

Claim.—1. The herein-described method of making sand molds having irregular faces on both sides thereof each forming part of the walls of a mold-cavity, which consists in cutting or planing off one side of the sand to an irregular shape corresponding to the face to be formed on that side of the mold, confining the sand in that shape, applying pressure from the opposite side of the mold in such a way as to shape the irregular face on that side of the mold and to compact the mold, and then assembling two or more of such molds face to face to form the mold-cavity.

2. The herein-described method of forming sand molds having faces on both sides thereof each forming part of the walls of a mold-cavity, which consists in filling a flask with sand, then cutting or planing off one surface of said sand to an irregular shape corresponding to the face to be formed on that side of the mold, confining the sand in that shape, and then forcing a pattern from the opposite side of the mold toward the confining means to compact the mold and form the irregular mold-faces upon both sides thereof.

3. The herein-described method of forming sand molds having faces on both sides thereof each forming part of the walls of the mold-cavity, which consists in filling the space within a flask above the stripping-plate and around and above the pattern with sand, then cutting or planing off the top surface of the sand to an irregular shape corresponding to the face to be formed on that side of the mold, confining the sand in that shape and then forcing the pattern and stripping-plate upwardly toward the top confining means to compact the mold and form the irregular mold-faces upon both sides thereof.

704,953. RUBBER-TIRE SETTER. HUGH R. AULD, Boston, Mass., assignor, by mesne assignments, of one-half to John J. McGlinchy, Chelsea, Mass. Filed Oct. 16, 1901. Serial No. 78,847. (No model.)

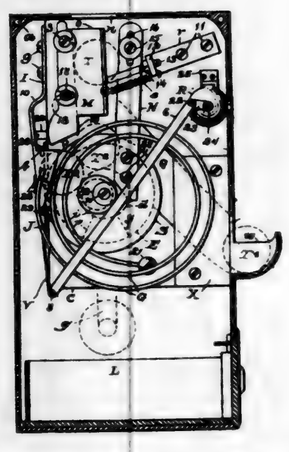


Claim.—1. A rubber-tire setter comprising a pair of guide-bars, two clamps guided and movable along said guide-bars to draw together the ends of the band or wire of the tire, means to move said clamps toward and from each other, an auxiliary clamp independently movable along said guide-bars to tighten said wire, and operating means to so move the said auxiliary clamp.

2. A rubber-tire setter comprising means to hold by one end a plurality of tire-wires, means to draw on the opposite ends of said wires, and a plurality of automatically-acting check-clamps adapted to hold the drawn ends of the individual wires independently of the drawing device.

3. A rubber-tire setter comprising a clamping device to secure the ends of a plurality of bands or wires of the tire, a compound clamping device movable toward and from the first said clamping device and consisting of a plurality of individual clamps provided with means for simultaneously adjusting them to grip the bands or wires, an independently-movable band or wire tightening device, and a plurality of independent automatic cam-clamps adapted to check the bands or wires.

704,954. COIN ALARM AND REGISTERING APPARATUS. ALBERT BARRETT, Kansas City, Mo. Filed Jan. 21, 1902. Serial No. 90,502. (No model.)



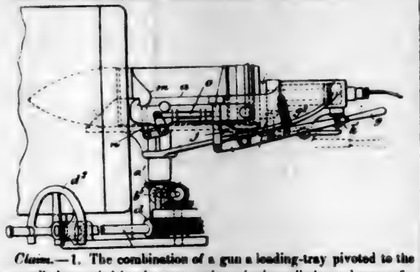
Claim.—1. A coin alarm and registering apparatus, consisting of a box, a coin-chute within the same whose opposite guiding adjustable edges are relatively movable and inclined toward each other at their lower ends, adapted to detain a coin inserted in the chute, a pocket to receive the coin from the chute, a coin-runway from the pocket to a coin-receptacle outside the box, a second coin-passage from the pocket normally obstructed, a gong at the exit of said passage, and means as described for directing the coin from the chute to the pocket and to the external coin-receptacle, or from the chute to the pocket through the second coin-passage and the exit thereof to the gong, as set forth.

2. A coin alarm and registering apparatus, consisting of a box, a coin-slot in a wall of the box adjacent to a coin-chute within the box whose edges are inclined toward each other and are relatively movable, a revolubie pocket provided with abutments, a coin-runway descending from the said pocket to a coin-receptacle outside the box, a second coin-passage normally blocked by a spring, a registering device operated by the said spring, a gong in proximity to the exit of the second coin-passage; with means for retaining a coin within the coin-chute, for causing the same to fall therefrom into said pocket, and for diverting the coin into the runway, or through the second coin-passage and against the gong, as set forth.

3. A coin alarm and registering apparatus, consisting of a box supported upon a base or back board, a coin-slot in a wall of the box opening to a coin-chute within the box, one edge and side of which are formed by a pivoted resilient member, the opposite edge consisting of a movable bar, the two edges normally inclining to each other, a revolubie pocket having abutments, a coin-runway descending from the said pocket to a coin-receptacle outside the walls of the box, a second coin-passage normally blocked by a flat spring, a gong in proximity to the exit of the second coin-passage, a registering device operated by the movement of the said flat spring; with means for retaining a coin within the coin-chute, for causing the same to fall therefrom into said pocket, and for diverting the coin into the runway or through the second coin-passage, and against the gong, as set forth.

4. A coin alarm and registering apparatus, consisting of a box, a block secured within the box adapted to support the operating parts, a drawer or coin-receiver; a coin-slot in the top of the box opening to a coin-chute within the box, the edges of the lower ends of which are inclined toward one another, and relatively movable, a rotative pocket having two abutments secured to a spindle projecting through the front wall of the box and having upon its end a crank-lever, a coin-runway descending from the said pocket to a coin-receptacle outside the box, a second coin-passage normally blocked by a resilient abutment and a spring, a registering device operative by the said spring, a gong in proximity to the exit of the second coin-passage, and an ejecting-lever; whereby when the said crank-lever is rotated in one direction, an inserted coin falls into said pocket and is carried to the said coin-receptacle, and when turned in the opposite direction the coin is carried through the second coin-passage and ejected against the gong, as set forth.

704,955. APPARATUS FOR LOADING ORDNANCE. RALPH T. BRANSTON, Newcastle-upon-Tyne, England, assignor to W. G. Armstrong, Whitworth & Company, Limited, Newcastle-upon-Tyne, England. Filed Jan. 25, 1902. Serial No. 91,233. (No model.)



Claim.—1. The combination of a gun a loading-tray pivoted to the gun, a cylinder carried by the tray, a piston in the cylinder and means for admitting fluid to and allowing it to escape from the cylinder.

2. The combination of a loading-tray, a cylinder carried by the tray, a piston in the cylinder, and admission and exhaust valves operated by the piston.

3. The combination of a loading-tray, a cylinder carried by the tray, a piston in the cylinder, a spring tending to move the piston in one direction, and means for admitting fluid to and allowing it to escape from the cylinder.

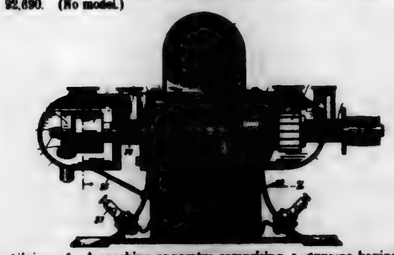
4. The combination of a loading-tray, a cylinder carried by the tray, a piston in the cylinder, a spring tending to move the piston in one direction, and admission and exhaust valves operated by the piston.

5. The combination of a loading-tray, a cylinder carried by the tray, a piston in the cylinder, a spring tending to move the piston toward the rear end of the cylinder, admission and exhaust valves at the rear end of the cylinder, springs tending to close the valves, a stem to the admission-valve projecting into the cylinder in the path of the piston, a stem to the exhaust-valve projecting out of the cylinder, a lever pivoted to the cylinder the rear end of which bears on the stem of the exhaust-valve while its front end lies in the path of the piston, a second lever pivoted to the cylinder and a bolt carried by the second lever and engaging with the piston when in its rearmost position.

6. The combination of a loading-tray, a cylinder carried by the tray, a piston in the cylinder, means for admitting fluid to and allowing it to escape from the cylinder, a bolt engaging with the piston when in its rearmost position, mechanism for locking the bolt when in engagement with the piston and means operated by the contact of the tray with the gun for freeing the locking mechanism.

7. The combination of a loading-tray, a cylinder carried by the tray, a piston in the cylinder, a spring tending to move the piston toward the rear end of the cylinder, admission and exhaust valves at the rear end of the cylinder, springs tending to close the valves, a stem to the admission-valve projecting into the cylinder in the path of the piston, a stem to the exhaust-valve projecting out of the cylinder, a lever pivoted to the cylinder the rear end of which bears on the stem of the exhaust-valve while its front end lies in the path of the piston, a second lever pivoted to the cylinder, a bolt carried by the second lever and engaging with the piston when in its rearmost position, mechanism for locking the bolt when in engagement with the piston and means operated by the contact of the tray with the gun for freeing the locking mechanism.

704,956. ELECTRIC GENERATOR. WALTER H. COTTON, Chicago, Ill., assignor of seventeen-twentieths to Harry L. Pock, Philip Hickley, and William P. Owens, Chicago, Ill. Filed Feb. 5, 1902. Serial No. 92,690. (No model.)



Claim.—1. A sparking apparatus comprising a dynamo having a working circuit through which passes all of the current generated, and a circuit-breaker constructed to break the circuit at periods when the generated current is at maximum potential.

2. In combination with an electric generator and its circuit, a circuit-breaker for opening the generator-circuit at the periods when the current generated is at maximum potential.

3. In an alternating electric generator, in combination, a field-magnet having poles, an armature movable in the magnetic field, a commutator having one of its rings divided into sections, alternate sections being respectively in and out of the armature-circuit, the parts being so disposed relatively that the commutator-brushes pass the division between such sections when the pole-pieces of the armature are at points in the magnetic field of the maximum magnetic force.

4. In a dynamo-electric generator, in combination, a generating-armature, a transformer the primary coil of which is in direct electrical connection with the generating-armature, and means in said connection for cutting out the coils of the generating-armature when the current generated thereby is at its maximum.

5. In a dynamo-electric generator, in combination, a generating-armature, a transformer the primary coil of which is in direct electrical connection with the generating-armature, and a cut-out in said connection for automatically cutting out the coils of the generating-armature when the current generated thereby is at maximum.

6. In a dynamo-electric generator, in combination, a generating-armature, a commutator mounted on and insulated from the armature-shaft and comprising a pair of rings one of which is composed of alternating conducting and non-conducting sections, one of the terminals of the armature being connected to the conducting-sections of the sectional ring and the other terminal to the other ring, a brush bearing on each ring, and a transformer, the primary coil of which is in electrical connection with the commutator-brushes.

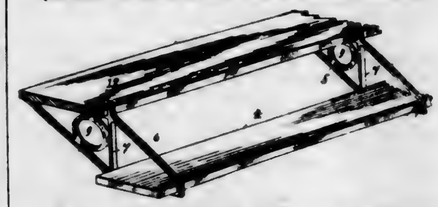
7. In a dynamo-electric generator, in combination, a field-magnet, a shaft, an exciting-armature and a generating-armature on the shaft and within the field of the magnet, a transformer, the primary coil of which is in direct electrical connection with the generating-armature, and means in said connection for cutting out the coils of the generating-armature when the current generated thereby is at its maximum and cutting in the same when the current is at its minimum.

8. In a dynamo-electric generator, in combination, a field-magnet, a shaft, an exciting-armature and a generating-armature on the shaft and within the field of the magnet, a transformer, the primary coil of which is in direct electrical connection with the generating-armature, and an automatic cut-out in the connection for cutting out the coils of the generating-armature when the current generated thereby is at its maximum and cutting in the same when the current is at its minimum.

9. In a dynamo-electric generator, in combination, a hollow base, field-magnet pole-pieces extending above the base, a shaft mounted between the pole-pieces, an exciting-armature and a generating-armature fixed on the shaft, and within the common field of the pole-pieces, a transformer located in the hollow base and the primary coil of which is in direct electrical connection with the generating-armature, and a cut-out in the connection for cutting out the coils of the generating-armature when the current generated thereby is at its maximum.

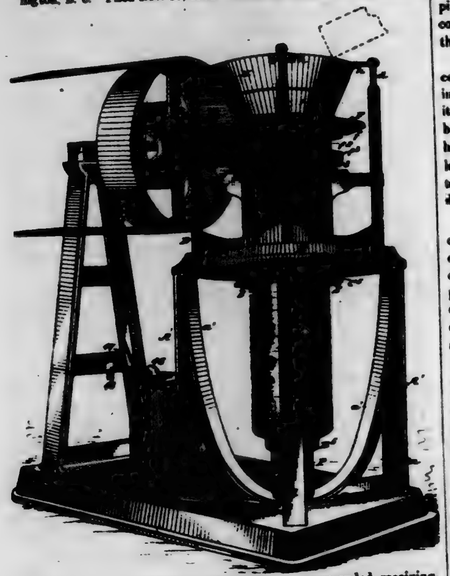
10. In combination with a generator having a single working circuit, means for automatically breaking the circuit at periods when the current generated is at maximum potential.

704,957. BRACKET FOR SUBSIDIARY SHELVING. WILEY G. CROOM, Memphis, Tenn., assignor of one-half to William F. Kean, Memphis, Tenn. Filed Mar. 18, 1902. Serial No. 98,826. (No model.)



Claim.—A bracket to be used in subsidiary shelving, which consists of a horizontal bar adapted for application to the under side of a stationary or main shelf, provided with a supporting-lug which extends over the upper side of the said shelf, combined with a second horizontal bar situated below and forward of the first, to sustain a subsidiary shelf, angular bars which connect the rear and the forward ends, respectively, of the horizontal bars, and a vertical bar which unites the forward end of the upper horizontal bar with the rear end of the lower one, substantially as specified.

704,958. ROUND-BALE COMPRESS. FRED G. DIETERICH, Washington, D. C. Filed Nov. 20, 1901. Serial No. 84,249. (No model.)



Claim.—1. In a cotton or other press, an open-ended receiving-chamber and a slotted head-plate, in combination with means for reducing the material into a thin bat or sheet, and simultaneously feeding it through the slotted head-plate into the receiving-chamber, and subjecting the same to pressure, said means including a pair of superposed rolls and a support therefor revolvable about the axis of the receiving-chamber, as set forth.

2. In a press of the character described, an open-ended receiving-chamber, a hopper having a radially-slotted bottom, and means mounted on said bottom to first compress the material into a thin sheet, and then feed the sheet through the slotted hopper-bottom, as described.

3. In a press as described, a press-chamber, a slotted head-plate therefor, a bat-forming means carried on the head-plate revolvable about the axis of the press-chamber, comprising superposed rolls and a conveyer for leading the loose material in the direction of the movement of the bat-forming rolls and between their compressing-surfaces, for the purposes described.

4. In a cotton-baling press of the character described, a revolvable hopper, a baling-chamber, a revolvable head in the entrant end of the said chamber, and a bat-forming means, comprising a pair of superposed rolls mounted on the head-plate, and disposed radially relatively to the baling-chamber, and means for imparting opposite rotation to the two rollers as they are horizontally revolved with the head-plate.

5. In a machine for compressing fibrous material, the combination with a slotted head-plate, a hopper over said plate, said hopper including a bottom centrally suspended and having inclined ways leading to the slots in the head-plate for guiding the material thereto.

6. In a machine for compressing fibrous material, substantially as described, the combination of a baling-chamber, a slotted head-plate, revolvable over the entrant end of said chamber, a hopper-section fixedly connected to and revolvable with the head-plate, said hopper including spiral ways inclined downward in the direction of revolution of the hopper and the head, for leading the loose material to the slots.

7. In a cotton or other press, means for reducing the loose material into a bat or sheet, and laying said sheet in spiral superimposed end laps, said means including a pair of superposed rolls, and means for rotating them relatively to each other and revolving both around a central axis, as set forth.

8. In a machine for compressing fibrous or other material, the combination with a receiving-chamber, and means for reducing the material to a bat, operative over the chamber, and adapted to lay the bat in superimposed layers therein; of an independently-supported hopper, and an independently-supported bottom therefor having guideways for leading the material to the bat-forming means, for the purposes specified.

9. In a machine for compressing fibrous material, the combination with a receiving-chamber for the compressed material; of a hopper revolubly over the entrant end of the receiving-chamber, said hopper having a slotted head-plate movable therewith, and a supplemental bottom pivotally mounted on the hopper, and having portions for directing and concentrating the fibrous material toward the slots in the head-plate, for the purposes specified.

10. In a press of the character described, in combination with a receiving-chamber, and means for feeding the material in superimposed laps into said chamber, said chamber having an annular surface surrounding its discharge end; of a series of combined severing and sustaining members pivotally mounted on the annular surface, adapted to sweep in a horizontal plane and penetrate the column at a point in line with the lower edge of the receiving-chamber, and means for imparting motion to said severing members, substantially as shown and for the purposes described.

11. In a machine of the character described, a severing mechanism, comprising in combination with the discharge end of the bale-receiving chamber; said chamber having an annular flange surrounding the discharge end, radially-disposed combined cutter and sustaining members pivotally mounted on the annular flange to sweep across the discharge end of the receiving-chamber, and a lever mechanism, rotatably mounted on the annular flange of the said chamber joined with the cutter-arms, and adapted to impart sweep movements thereto in unison, as set forth.

12. In a machine for compressing fibrous material, the combination with the stationary receiving-chamber, and the rotatable hopper-section, said section including the slotted head-plate or flotment; of the radially-disposed compressing-rolls mounted on the head-plate, and adapted to discharge the compressed bat or sheet into the slots of the head-plate, and an independently centrally supported hopper-bottom, having a separate guideway or incline for each set of rolls, adapted to lead the material to said rolls in independent batts, and mechanism for revolving the hopper with the bat-forming rolls about the axial center of the receiving-chamber and rotating the bat-forming rolls on their own axes, substantially as shown and described.

13. The combination with the stationary receiving-chamber C, having an annular cog-rim c^3, and radial roller-supports, the frame F revolvable over the upper end of the chamber C, having a pendent flange, adapted to rest and rotate upon the radial roller-supports, said frame F having a slotted bottom or head-plate, superposed compressing-rollers coöperating with the slots and adapted to reduce the material to a bat or sheet prior to its passage through the slots, and to feed said sheet or bat into the slots, the gear g, and drive-shaft for imparting rotation to the frame F, substantially as and for the purpose described.

14. The combination with the chamber C, and the fixedly-held hopper; of a supplemental hopper held between the fixed hopper and the entrant end of the chamber C, said hopper including a slotted bottom for opposing the entrant end of the chamber C, over which it has a radial sweep, bat-forming rolls mounted on said bottom to move therewith, means for imparting a rotary motion to the rolls as they move around with the hopper and a supplemental bottom loosely supported in the hopper to revolve therewith, said supplemental bottom having independent guideways inclined downwardly to the entrant edges of the bat-forming rolls, all being arranged substantially as shown and for the purposes described.

15. The combination with the receiving-chamber and the independently-supported hopper, having a radially-slotted bottom, and means for rotating the hopper about the axial center of the receiving-chamber; of a hopper-bottom loosely held on the hopper, means for pivotally supporting said hopper over the axial center of the head-plate, said bottom having independent guideways, leading toward the slots in the head-plate, as specified.

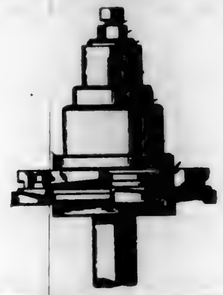
704,959. PAINT. GEORGE W. DOERR, Dover, Me., and ALLAN J. DOERR, Greene, Iowa; said Allan J. Doerr assignor to said George W. Doerr. Filed Feb. 27, 1901. Serial No. 49,073. (No specimens.)

Claim.—1. A paint compound having the ingredients and proportions substantially as follows, coal-tar fifty-two gallons, gasoline ten gallons, cement ten pounds, graphite five pounds, sodium chlorid five pounds, and sodium carbonate, two and one-half pounds.

2. The method of forming a paint compound, which consists in thoroughly mixing fifty-two gallons of coal-tar with ten gallons of gasoline, and then thoroughly mixing into the coal-tar and gasoline successively, ten pounds of cement, five pounds of graphite, five pounds of sodium chlorid and two and one-half pounds of sodium carbonate.

704,960. ROTARY CUTTER. JOEL ETTINGER, Chester, Pa., assignor to the Ettinger Machine Company, Limited, Chester, Pa., a Partnership. Filed Oct. 5, 1900. Serial No. 32,161. (No model.)

Claim.—1. A cutter-head comprising two members, one of which is provided with devices for securing one of the cutters in place, and the other of which is provided with independent devices for securing the other cutter in place, means for adjusting one member of the cutter-head toward and from the other, a circular cutter-disk arranged concentric with the axis of one member of the cutter-head formed integrally with a series of teeth on its periphery and directly secured to this member of the cutter-head, a similar circular cutter-disk arranged concentric with the axis of the other member of the cutter-head formed with a series of teeth on its periphery and connected directly to said other member of the cutter-head.



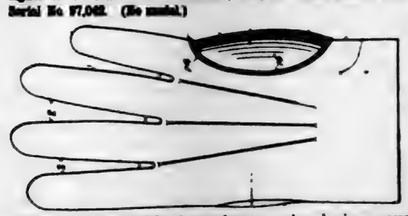
2. The combination of an expansible cutter-head and two opposing cutters, each comprising a disk formed integrally with a series of teeth on its periphery and each disk being arranged concentric with the axis of the cutter-head and movable toward and from each other coincidently with the movement of the two members of the cutter-head, said disks being also formed with projections which interlock, substantially as described.

3. The combination of a cutter-head member having a flanged screw-threaded portion, a circular cutter secured to such threaded portion, a second cutter-head member having a tapered flange, a circular cutter provided with a series of teeth on its periphery and having a tapered opening fitting the tapered flange, a clamping-collar for holding the cutter on the tapered flange, and means for adjusting the cutter-head members to move the cutters toward and from each other.

4. The combination of a cutter-head member consisting of a sleeve having a flanged end to receive a cutter, a second cutter-head member surrounding the sleeve of the first member and having a flanged end to receive another cutter, a screw-collar for clamping the cutter on the outer member of the cutter-head, a bolt extending through a threaded hole in the outer member of the cutter and through a slot in the sleeve of the inner member, a nut engaging a screw-threaded portion of the sleeve of the inner member of the cutter head, and connections between the nut and the outer member of the cutter-head.

5. The combination of a pair of cutters provided with teeth on their peripheries which interlock and which are provided with flanges to guard or cover the openings otherwise left between the body portions of the cutters.

704,961. GLOVE. STEPHEN M. GRIFFITHS, Philadelphia, Pa., assignor of one-half to Charles Pierson, Bala, Pa. Filed Mar. 7, 1902. Serial No. 97,042. (No model.)



Claim.—1. As an article of manufacture, a glove having a gusset inserted in the edge thereof, opposite the thumb, and a rib formed around said gusset.

2. As an article of manufacture, a glove having a laterally-expanded gusset inserted in the edge of the glove, opposite the thumb, extending from adjacent the base of the little finger beyond the inner termination of the wrist slit or placket, and having an outwardly-extending rib formed at the meeting edges of the gusset and glove-body.

3. As an article of manufacture, a glove having a gusset formed in one edge thereof opposite the thumb, the seam between said gusset and glove forming a rib around the same.

4. As an article of manufacture, a glove having a gusset formed in one edge thereof, and an outwardly-turned seam around said gusset formed by the edges of said gusset and said glove being brought together.

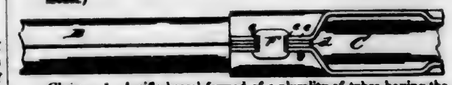
5. As an article of manufacture, a glove, having a cut-away portion, and a gusset having a transverse fullness covering said cut-away portion, the meeting edges of said gusset and glove extending outwardly upon the outside surface of the glove, forming a rib.

6. As an article of manufacture, a glove having a portion of its edge opposite the thumb cut away, a gusset having a transverse fullness covering said opening, and a rib around said gusset, formed by the meeting edges of said gusset and glove extending outwardly from the surface of the glove.

7. As an article of manufacture, a glove having a gusset inserted in the edges thereof opposite the thumb, and extending inwardly from said edge on the palm and back of the glove, and a rib around the gusset.

8. As an article of manufacture, a glove having a rib extending from adjacent the base of the little finger and inwardly on the palm and back of said glove, and returning to the edge of said glove at a point beyond the inner termination of the wrist slit or placket.

704,962. GUN-BARREL. CLARENCE J. HAMILTON, Plymouth, Mich., assignor to C. J. Hamilton & Son, Plymouth, Mich., a Copartnership. Original application filed May 13, 1901, Serial No. 60,997. Divided and this application filed Jan. 8, 1902. Serial No. 88,895. (No model.)



Claim.—1. A rifle-barrel formed of a plurality of tubes having the rear portion of one outset at the seam and a key for locking the outset edges, substantially as described.

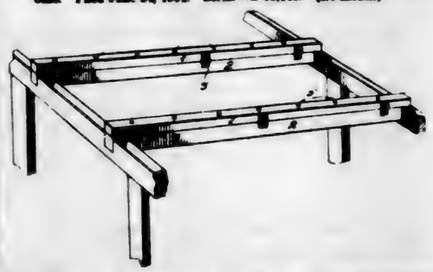
2. The combination of the rifle-barrel formed of a plurality of tubes, one of said tubes provided with outset edges at the breech, the receiver provided with similar outset edges and means for engaging the rifle-barrel and receiver through the said edges, substantially as described.

3. A rifle-barrel formed of a plurality of tubes, one of said tubes having outset edges at the breech, said outset edges provided with a keyway and a key swaged in said keyway, substantially as described.

4. In gun construction, the combination of the barrel provided with the holding-rib at the rear, the receiver provided with outset edges, and means for locking the rib and edges together, substantially as described.

5. In gun construction, the inner barrel, the outer covering for the barrel formed from sheet metal with an open seam and means for clamping the covering to the barrel, substantially as described.

704,963. POULTRY-PERCH. ORRIAN L. HARMON, Bells Center, Ohio, assignor to Medicated Poultry Perch Company, Bells Center, Ohio. Filed June 24, 1901. Serial No. 65,963. (No model.)



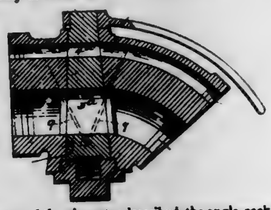
Claim.—1. A poultry-perch consisting of a hollow closed-ended structure composed of two parts hinged together, one of the parts being provided with perforations communicating with the interior of the perch.

2. A poultry-perch consisting of a hollow closed-ended structure composed of two parts hinged together and to contain a suitable insecticide in bulk, one of the parts being provided with perforations communicating with the interior of the perch, and fastening means for holding the parts assembled.

704,964. ANGLE-COCK. JAMES A. HELM, Newark, Ohio, assignor of one-half to Adam C. Wagner, Newark, Ohio. Filed Sept. 23, 1900. Serial No. 30,561. (No model.)

Claim.—1. In apparatus of the character described, the angle-cock having its plug provided with a return air-port and a by-pass adapted to communicate with a tortuous lateral channel or passage in the plug closure or casting, in turn communicating with a return-passage also in said plug closure or casting and a pipe adapted to connect with said return-

air-passage, said return air-port also communicating with said return air-passage, substantially as set forth.



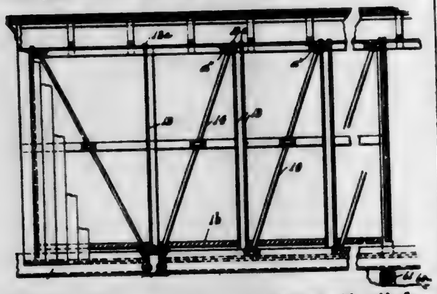
2. In apparatus of the character described, the angle-cock casting or closure having lateral passages or channels jointly of V shape, the angle-cock plug having a by-pass with its horizontal portion below the lower port of said plug and one extremity adapted to communicate with the apex of said lateral V-shaped channels communicating with a return air-passage in said plug-casting, and means connecting said return-passage to a signaling device in the engine-cab, substantially as set forth.

3. In apparatus of the character described, the angle-cock comprising a casting having a lateral V-shaped channel and a return air-passage, a plug having two ports, one adapted to communicate with said return air-passage, and a by-pass adapted to engage with said V-shaped channel, a pipe connecting said return-passage to a signaling device in the engine-cab, and a valve arranged in said return air-passage, under the angle-cock-plug lever, substantially as set forth.

4. In apparatus of the character described, the combination of an angle-cock having its casting or closure provided with a lateral passage and a return air-passage communicating with said lateral passage said angle-cock having its plug provided with a by-pass having vertical arms terminating in lateral extensions at their upper ends, communicating with the train brake-pipe, and with said lateral passage said plug also having a port communicating with said air-return passage, substantially as set forth.

5. In apparatus of the character described, the angle-cock having its plug provided with by-passes, with one arm of each adapted to communicate with the main air-passage of the train-pipe, said plug having its closure provided with circuitous passages or channels adapted to connect at a common point with said by-passes and with a return-passage in the plug-closure, substantially as set forth.

704,965. CAR CONSTRUCTION. HENRY C. HODGES and GUSTAVE A. BLUME, Detroit, Mich.; said Blume assignor to said Hodges. Filed May 4, 1901. Serial No. 58,701. (No model.)



Claim.—1. In a frame for a car, in combination with a side floor-sill provided with a vertical web and a horizontal flange extending from the bottom of the web, pockets resting on the flange and secured to the sill, tubular compression members forming part of a truss-work, a top chord to said truss-work and tie-rods uniting the chord and the sill, substantially as described.

2. A car-framing having in combination center sills, metallic side sills provided with horizontal projecting flanges and vertical webs, pockets resting on the flange of said side sills adapted to receive the lower ends of tubular compression members, tubular compression members engaging in said pockets, and tie-rods engaging the sills and top chords and forming a completed metallic truss-work, substantially as described.

3. In car construction, in combination with center sills, and side sills provided with vertical webs and horizontally-projecting flanges, pocket-abutments secured above the flange and at the sides of the vertical web adapted to receive the ends of the tubular metallic compression members, tubular compression members forming part of a truss-work and tie-rods uniting the sills and top chords of said truss-work, substantially as described.

4. In car construction, the combination of a side sill provided with a vertical web, and a horizontal projecting flange, abutment-pockets secured with a side bearing on the web and under bearing on the flange and adapted to receive tubular compression members, tubular compression members of a truss-work engaging in said abutment-pockets, a top chord to said truss-work and tie-rods uniting the side sill and the chord, substantially as described.

5. In a composite car, in combination with a metallic side sill provided with a vertical web and a horizontal flange, a metallic truss-work composed of tubular compression members and tie-rods, and having an under bearing on the flange and a side bearing against the web of said sill, and a damper-timber extending in contact with the truss members and between the top and the bottom ends thereof and arranged to receive the truss members and having gains in said damper-timber, substantially as described.

6. In a composite car, in combination with a Z-shaped side bar arranged with its web vertical its upper flange directed toward the middle line of the car its lower flange directed outward, a truss-work bearing on the lower flange, a nailing-strip secured to the upper flange of the Z-bar inside the truss-work, substantially as described.

7. In a composite car, an abutment-pocket having in combination a part arranged to engage in the angle of a flanged sill, and a part arranged to engage at the side of and to partly overlap the first part, the two parts being concaved to form a pocket for a compression member and bored with registering holes to allow a tension member to engage through both parts, substantially as described.

8. In composite-car construction, an abutment-pocket arranged to receive the end of a compression member, against a shoulder therein and to receive the end of a tension member which traverses both pieces thereof, substantially as described.

9. In car construction, the combination of side beams of a Z form having one flange of the beam turned inward to support the floor and one flange of the beam turned outward to support abutment-pieces for a truss superstructure, a truss-work of tie-rods and tubular compression members, and abutment-pieces arranged to engage the compression members and support the end thrust thereof and to engage the tie-rods through perforations therein, substantially as described.

10. In car construction, the combination of a side sill of metal, a truss superstructure extending from each end of the car inward, the sill and top chord of said truss crossing the opening between the ends of the truss-work and a tie-plate located under said opening and fortifying the sill at said location, substantially as described.

11. In car construction, the combination of a side beam of metal, a metallic truss superstructure and abutments engaged against the vertical web of the beam, and bearing against a horizontal flange of the beam arranged to be tied by tension members, and provided with abutments to receive the ends of compression members, substantially as described.

12. In a composite car, the combination with side sills with projecting horizontal flanges in the substructure, angle-beams forming the top chord of the superstructure, a truss uniting the sill and the top chord and supported on the flange, an intermediate longitudinal beam of wood provided with gains in which the upright members engage and with binding-blocks set in the gains over the vertical members, substantially as described.

13. In a composite car, the combination with a metallic truss superstructure, a longitudinal beam of wood between the top and the bottom ends of the truss forming a damper, and having gains in which to engage and clamp the vertical members, substantially as described.

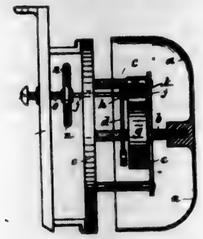
14. In car construction, in combination with top and bottom chords each of which has a vertical web and a horizontally-extending flange, compression members of tubular shape and means for securing the compression members to both the web and flange, substantially as described.

15. In car construction, in combination with side sills and top chord a truss-work having tubular compression members and metallic tension members, substantially as described.

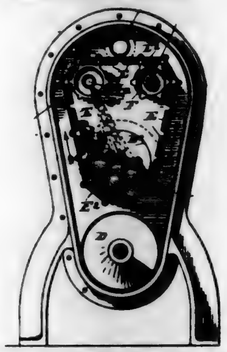
704,966. MEANS FOR AUTOMATICALLY INDICATING CHANGES IN TEMPERATURE. RICHARD KETTS, Whangarei, New Zealand, assignor to Charles Ernest Randolph Mackesy, The Hill, Whangarei, Auckland, New Zealand. Filed May 20, 1902. Serial No. 108,280. (No model.)

Claim.—1. In means for indicating a change in temperature, a bell provided with a spring-actuated tongue, a collar upon a sliding spindle engaging with and holding the tongue from movement, and a capsule upon the end of the spindle composed of flexible walls and containing a fluid of a nature such that it will expand and contract when subjected to heat and cold, as herein specified.

2. In means for indicating a change in temperature, a bell provided with a spring-actuated tongue and mounted upon a suitable base secured to a frame by means of which it may be fixed in any desired position, a collar upon a spring-sliding spindle engaging with and holding the tongue, a capsule composed of flexible walls and containing a fluid susceptible to expansion and contraction by heat and cold which is secured to the end of the sliding spindle, and a regulating-screw within the frame, the end of which bears against the other side of the capsule, as herein set forth.



704,967. ACETYLENE-GAS GENERATOR. FRED L. KINCAID, Stockton, Cal., assignor to Pacific Acetylene Gas Company, San Francisco, Cal., a Corporation of California. Filed Nov. 2, 1898. Renewed Mar. 3, 1902. Serial No. 96,577. (No model.)



Claim.—1. A gas apparatus comprising a generator, a rotary shaft therein having suitable driving-wheels, a spray-pipe running parallel with said shaft in the generator and carrying driven wheels, a carrier composed of hinged slats hung on the driving and the driven wheels, and means to rotate said shaft, substantially as described.

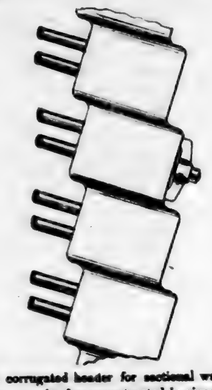
2. A gas apparatus comprising a generator, a traveling carbid-carrier composed of hinged slats suspended at a suitable height therein, a spray device arranged to throw water upon the live carbid in the carrier, and a screw conveyor located beneath the carrier and adapted to remove from the generator the slaked carbid that falls through the spaces between the hinged slats of the carrier, substantially as described.

3. A gas apparatus comprising a generator, shafts placed parallel therein, sprocket-wheels fast on one of said shafts, sprocket-wheels loose on the other one of said shafts, a carbid-carrier composed of flexibly-connected slats hung on said sprocket-wheels, a gasometer, a pawl-and-ratchet mechanism connected with the shaft that carries the fixed sprocket-wheels, and connections between the gasometer and the pawl-and-ratchet mechanism whereby the latter is operated and the carrier turned while the gasometer moves, substantially as described.

4. A gas apparatus comprising a generator, a rotary shaft and a spray-pipe placed parallel therein, sprocket-wheels fast on said rotary shaft, sprocket-wheels loose on said spray-pipe, a carbid-carrier composed of flexibly-connected slats hung on said sprocket-wheels, a gasometer, a ratchet-wheel and pawl adapted to turn the rotary shaft, a water-cock controlling the flow of water to the spray-pipe, a lever arranged to work both the pawl and the water-cock, and means, such as a rod, to swing said lever through the rise and fall of the gasometer, substantially as described.

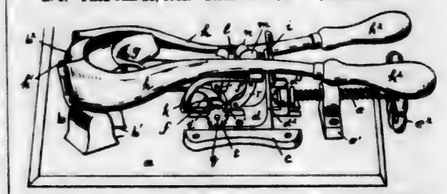
5. In a gas apparatus, the combination of a generator-casing, a shaft therein having driving-wheels, a spray-pipe parallel with said shaft and carrying driven wheels, a flexible carrier hung on said wheels, and means for operating said shaft, substantially as described.

704,968. HEADER FOR SECTIONAL STEAM-GENERATORS. JAMES H. ROSENTHAL, London, England, assignor to The Babcock & Wilcox Company, New York, N. Y. Filed Dec. 12, 1901. Serial No. 86,578. (No model.)



Claim.—A corrugated header for sectional water-tube steam-generators having its opposite faces constructed in zigzag or stepped form at each corrugation with surfaces at right angle with the line of the axis of the connected water-tubes, as set forth.

704,969. CRUPPER-DOCK-FORMING MACHINE. CHARLES H. RUDGE, Newark, N. J., assignor of one-half to Arthur E. Rudge, Newark, N. J. Filed Jan. 21, 1902. Serial No. 90,651. (No model.)



Claim.—1. A machine for bending crupper-docks, comprising a stationary member *b*, concaved in plan and adapted to fit against one side of the crupper-dock, a sliding member convexly curved in plan, and adapted to lie against the other side of the crupper-dock, means for forcing said sliding member toward the stationary member to grip a crupper-dock, and bending-levers pivoted at opposite ends of said stationary member to swing in horizontal plane.

2. The herein-described machine for bending crupper-docks, comprising adjustable clamping members concaved at their faces to grasp the crupper-dock and curved in plan to conform to its ultimate shape, said members being adapted to grasp a crupper-dock at its middle, and bending-levers pivoted at the ends of one of said members to swing in horizontal plane, and being adapted to bend the crupper-dock around the other member.

3. In a machine for bending crupper-docks, the combination of two curved clamping members adjustable in relation to each other, the one at the inner ends of the curve being extended rearwardly at its ends to constitute a former around which the crupper-dock may be bent, bending-levers pivoted at the ends of the outer clamping members adapted to swing in horizontal plane, and tilting gripping means adapted to grasp the ends of the crupper-dock, when brought together by the said forming means, and bend them out of the plane of the main portion of the crupper-dock.

4. In a machine for bending crupper-docks, the combination of a former having a side or face vertically concaved to fit a crupper-dock and being curved in plan to shape said crupper-dock, a clamping member having a similarly-concaved face adapted to coöperate with the former in gripping a crupper-dock, and clamping-levers pivoted to opposite ends of said clamping member and adapted to close around the former to press the crupper-dock thereagainst.

5. In a machine for bending crupper-docks, the combination of a former shaped in plan to give proper form to a crupper-dock and being vertically concaved at its edges to receive the crupper-dock, of curved bending-levers adapted to swing in the plane of the said former and close thereabout and a supporting member to which said bending-levers are pivoted.

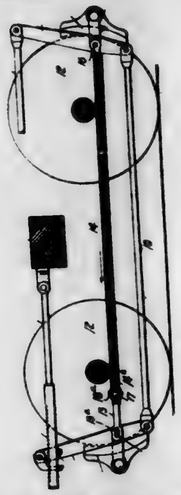
6. The combination with the stationery member *b*, and bending-lever pivoted thereto, of a member *d*, adapted to slide toward and away from said stationery member and providing a former, and a screw for moving said sliding member.

7. The combination with the gripping members *b*, *d*, one comprising a former around which a crupper-dock may be bent, and bending-levers, of pivotal clamping-plates adapted to grasp the ends of the crupper-dock when brought together one of said plates providing a curved surface next to the crupper-dock and means for tilting said clamping-plates.

8. The combination with the gripping members *b*, *d*, one comprising a former around which the crupper-dock may be bent, of a pivotal plate at the rear of said former presenting a curved surface adapted to lie at one side of the plane of said bending, means for clamping the ends of the crupper-dock to said pivoted plate and means for tilting said plate and clamping means.

9. The combination of members *b*, *d*, adapted to grip a crupper-dock at its middle one of said members, constituting a former, bending-levers pivoted clamping means adapted to grasp the ends of the crupper-dock when bent, curved lips on said clamping means adapted to lie at one side of the plane of the crupper-dock, and means for tilting said pivoted clamping means, whereby the ends of the crupper-dock may be bent over the said curved lips.

704,970. SLACK-ADJUSTER. WILLIAM H. SARVAGE, Denver, Colo., assignor to Chrustus A. Tripp, Salt Lake City, Utah. Filed Oct 26, 1901. Serial No. 79,960. (No model.)



Claim.—1. The combination with brake mechanism, of means for automatically retaining the brake-shoes at a predetermined distance from the car-wheels, said means comprising a two-part frictionally-held connection between the brake-beams, a ratchet-bar mounted on a relatively stationary part of the car, and a dog mounted on the dead track-lever and engaging the teeth of the ratchet-bar, the arrangement being such that as the brakes are released, the dead track-lever is actuated to compensate for the limit of movement of the live track-lever, the dog engaging the ratchet-bar to hold the dead track-lever in the adjusted position.

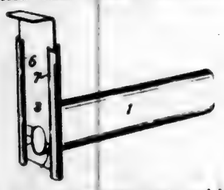
2. In a slack-adjuster, the combination with a brake mechanism, of a two-part frictionally-held connection between the brake-beams, a ratchet-bar mounted on a relatively stationary part of the car and slotted to receive the dead track-lever which passes upwardly therethrough, and a dog mounted on the upper extremity of the said lever and adapted to engage the teeth of the ratchet-bar.

3. In an apparatus of the class described, the combination with brake mechanism, of a two-part frictionally-held connection between the brake-beams, a ratchet-bar mounted on a relatively stationary part of the car, and slotted to receive the dead track-lever which passes upwardly therethrough, a dog mounted on the upper extremity of the said lever and engaging the teeth of the ratchet-bar, the dog being provided with a pin projecting downwardly through the slot of the ratchet-bar, and a device attached to said pin below the bar to prevent displacement of the dog.

4. In a slack-adjuster for car-brakes, the combination with brake mechanism, of a two-part frictionally-held connection between the brake-beams, a ratchet-bar mounted on a relatively stationary part of the car and slotted to receive the dead track-lever which passes upwardly therethrough, the lever being provided with an antifrictional support for the ratchet-bar, and a dog mounted on the upper extremity of the said lever and adapted to engage the teeth of the ratchet-bar, substantially as described.

5. In a slack-adjuster, the combination with brake mechanism, of a two-part frictionally-held connection between the brake-beams, a ratchet-bar mounted on a relatively stationary part of the car and slotted to receive the dead track-lever which passes upwardly therethrough, a dog mounted on the upper extremity of the said lever and adapted to engage the teeth of the ratchet-bar, and means mounted on a relatively stationary part of the car, and engaging the levers of the air-brake system, to facilitate the prompt release of the brake-shoes and the necessary adjustment of the track-levers, to compensate for the changed relation of the parts incident to taking up the slack during the brake-setting operation.

704,971. FLUME-GATE. EPHRAIM CAMPBELL, Redlands, Cal. Filed Nov. 19, 1901. Serial No. 82,896. (No model.)



Claim.—1. A flume-gate comprising a tube oval in cross-section; a gate-holder fastened to the tube near the end thereof; and a gate held by said holder and sliding across the end of the tube and furnished in its lower end with a notch.

2. A plate having inbent edges and a perforation between said edges; a tube inserted through the perforation and fastened to the plate and terminating in a plane near the plane in which the inbent edges lie and being beyond the plate; and a sliding gate fitting between said tube end and said inbent edges.

3. A flume-gate comprising a perforated plate having inbent edges; a flattened tube fastened to the plate and extending through the perforation and terminating in a plane near the plane in which the inbent edges lie: the greater diameter of the tube extending lengthwise between said edges; and a sliding gate fitting between said inbent edges and the end of the tube, the lower end of said gate being notched to correspond with the opening through the tube.

4. A flume-gate comprising a tube to extend through a flume-wall, and a gate-holder fastened to the tube at a distance from the end thereof and extending beyond the end of said tube and terminating in two edges which lie in a plane that extends near the plane of the end of the tube; and a gate fitting against the end of the tube on the one side and against said edges on the other side.

704,972. TEMPERATURE-PRESERVING BOTTLE-COVER. FREDERICK T. GRIFFITH, Los Angeles, Cal. Filed July 5, 1901. Serial No. 67,240. (No model.)

Claim.—1. A bottle cover or casing comprising a cup-shaped body or lower portion, a pair of oppositely-arranged portions constituting the neck of the casing when together hinged to the top of the body upon opposite sides, and a removable cap adapted to cover and surround the upper ends of said portions when together.

2. A bottle cover or case, lined with a heat-non-conducting material and comprising a lower cup-shaped body a pair of portions constituting the neck of the case hinged upon opposite sides of the body and provided with flanges upon their lower edges to lap over the upper edge of the body, catches to hold the portions together, and a cap to fit over the upper ends of the portions.

3. A bottle cover or case, comprising a lower portion or body provided with a handle, a neck formed in two equal portions each of which are hinged upon opposite sides of the body and adapted to swing outward to admit a bottle to the body, said portions being provided with tongue-and-groove edges, catches to hold the portions together, and a cap to fit over them when together.

704,973. GARMENT-CLASP. SAMUEL KATZ, Des Moines, Iowa. Filed Feb. 3, 1902. Serial No. 92,265. (No model.)

Claim.—1. The garment-clasp, comprising a clasp-body made of spring metal doubled upon itself to form an eye and having its arms of approximately equal length and width extended from the eye in contiguity with each other, said arms curved in opposite directions and one of them offset near its central portion, one of the spring-arms of the clasp-body being formed with an aperture near its extremity, a stud on the opposite spring-arm arranged for traversing said aperture, which stud is of conical form with a rounded apex, a clamp slidingly mounted on the spring-arms and arranged to compress said arms in a forward movement of the clamp and a spring-tongue fixed to one face of one of the spring-arms and extended toward the opposite arm when the device is open, the end of said spring-tongue being back of and below the apex of said stud, said spring-tongue serving as an abutment to limit the entrance of a garment or fabric between the spring-arms.

2. The garment-clasp, comprising a clasp-body made of spring metal doubled upon itself to form an eye and having its arms of approximately equal length and width extended from the eye in contiguity with each other, said arms curved in opposite directions and one of them offset near its central portion, one of the spring-arms of the clasp-body being formed with an aperture near its extremity, an eyelet mounted for diametrical movement in said aperture, a stud on the opposite spring-arm arranged for traversing said opening of said eyelet, which stud is of conical form with a rounded apex, a clamp slidingly mounted on the spring-arms and arranged to compress said arms in a forward movement of the clamp and a spring-tongue fixed to one face of one of the spring-arms and extended toward the opposite arm when the device is open, the end of said spring-tongue being back of and below the apex of the stud, said spring-tongue serving as an abutment to limit the entrance of a garment or fabric between the spring-arms.

3. In a device of the class described, a spring-arm, an eyelet mounted for diametrical movement therein, another spring-arm, a stud mounted thereon and arranged to traverse the opening of said eyelet, and means for compressing said spring-arms together.

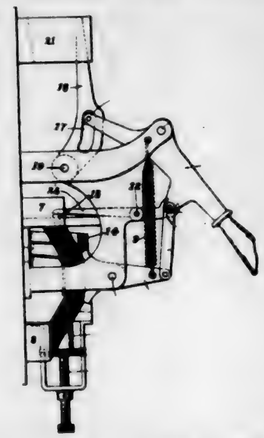
704,974. AUTOMATIC MAGNETIC CIRCUIT-BREAKER. WILLIAM M. SCOTT, Philadelphia, Pa., assignor to Cutter Electrical & Manufacturing Company, a Corporation of New Jersey. Original application filed Feb. 23, 1900, Serial No. 6,179. Divided and this application filed June 20, 1902. Serial No. 112,466. (No model.)

Claim.—1. The combination with a base, of a main terminal, a second main terminal vertically above said terminal, a laminated bridge member pivotally secured to the base and rotatably movable to and away from the main terminals in a plane parallel to a plane including said fixed terminals, and an actuating member having power-multiplying connection between the base and the laminated member.

2. The combination of a base, main fixed terminals in a vertical plane located thereon, a laminated bridge pivotally secured to said base, and having a rotatable movement to and away from the fixed terminals in a plane parallel to a plane including said fixed terminals, and an actuating member pivotally secured to the base and a power-multiplying connection with the laminated bridge.

3. In an electric switch, the combination of a base, main fixed terminals located thereon, one vertically above the other, and a laminated member pivotally secured to the base and rotatably movable in a plane parallel to a plane embracing or passing through the fixed terminals, to and away from said fixed terminals, and an actuating member having power-multiplying connection with the laminating member.

4. In an electric switch, a base, main fixed terminals located thereon, one vertically above the other, a laminated member pivotally secured to the base and having rotatable movement in a plane parallel to a plane embracing or passing through the fixed terminals to and away from the fixed terminals, and an actuating member pivotally secured to the base and a power-multiplying connection with the laminated member.



5. In an electric switch, the combination of a base, main fixed terminals located thereon, one vertically above the other, a movable laminated bridge coöperating with said terminals and pivotally secured to said base, a manually-operative actuating member, a toggle connection between said member and the bridge, spring means for actuating the bridge, latching means for normally restraining the switch in closed position and automatic magnetic means for actuating the restraining means.

6. In an electric switch, the combination of a base, main fixed terminals located thereon, one vertically above the other, the engaging face of one terminal being in a vertical plane, and the engaging face of the other terminal in a horizontal plane, a laminated bridging member pivoted to the base, an actuating member and toggle-lever connection between said actuating member and the bridging member.

7. In an electric switch, the combination of main fixed terminals, one vertically above the other, the engaging face of one terminal being in a vertical plane and the engaging face of the other terminal being in a horizontal plane, and a bridging member for said terminals.

8. In an electric switch, the combination of main fixed terminals, one terminal having its engaging face in a vertical plane, and the other terminal having its engaging face in a horizontal plane, and a bridging member for said terminals.

9. In an electric switch, the combination of main fixed terminals, one terminal having its engaging face in a vertical plane and the other terminal having its engaging face in a horizontal plane, a bridging member for said terminals, and supplemental contacts in shunt to said fixed terminals.

10. In an electric switch, the combination of main terminals, one vertically above the other, a laminated member for bridging said terminals pivoted to the base, an actuating member connected to said bridging member by means of toggle-levers a latch engaging with one of said toggle-levers, and electroresponsive means for operating the latch.

11. In an electric switch, the combination of main contact-blocks, one vertically above the other, a laminated member for bridging said blocks pivoted to the base, an actuating member connected to said bridging member by means of toggle-levers, a latch engaging with one of said toggle-levers, an electroresponsive means for operating the latch and shunt-contacts vertically above the main contacts also released by said electroresponsive means.

12. An electric switch comprising stationary contact-blocks in vertical alinement, a supporting-base therefor, a laminated member engaging with its beveled ends upon said blocks, a supporting-arm pivoted to said base and attached to the laminated member at substantially its middle, and an actuating-lever pivoted to the base and having operative connection with said supporting-arm.

13. In an automatic magnetic circuit-breaker, in combination with a base, stationary main terminals mounted thereon in vertical alinement and shunt-terminals mounted on said base above the main terminals, a laminated contact member pivoted to said base and movable in a vertical plane to and away from said main terminals, a movable shunt contact member, a toggle for operating the main contact member, means for locking the circuit-breaker in closed position, and a tripping device controlled by electroresponsive means.

14. In an automatic magnetic circuit-breaker, in combination with a base of stationary main terminals thereon in vertical alinement, and shunt-terminals mounted on said base above the main terminals, a laminated contact member pivoted to said base and movable in a vertical plane to and away from said main terminals, a movable shunt contact member, a toggle for operating the main contact member, means for operating the toggle and shunt contact member, means for locking the breaker in closed position, and a tripping device controlled by electro-responsive means.

15. In an electric switch, the combination of fixed terminals and a movable laminated bridge pivotally secured to the base on an axis parallel with the base, the bridge lamiuse having beveled ends engaging with said fixed terminals, and a manually-operative actuating-lever having a power-multiplying connection with the bridge.

16. In an electric switch, the combination of fixed terminals and a laminated bridge pivotally secured to the base on an axis parallel with the base and rotatably movable in a plane parallel to a plane including said fixed terminals to and away from said fixed terminals, and an actuating member having power-multiplying connection between the base and the laminated member.

17. In an electric switch, the combination of fixed terminals, a laminated bridge pivotally secured to the base on an axis parallel with the base and having a rotatable movement to and away from the fixed terminals in a plane parallel to a plane including said fixed terminals, and an actuating member pivotally secured to the base having power-multiplying connection with the laminated bridge.

18. In an electric switch, a combination of fixed terminals, a movable laminated bridge pivotally secured to the base on an axis parallel with the base, the bridge laminæ having beveled ends engaging with said fixed terminals, and a manually-operative actuating member having toggle-lever connection with the bridge.

19. In an automatic magnetic circuit-breaker, the combination of fixed terminals, and a movable laminated contact member pivotally secured to the base on an axis parallel with the base, the laminæ beveled at their ends and engaging with the fixed terminals, and a manually-operative actuating-lever having power-multiplying connection with the laminated member.

20. In an automatic magnetic circuit-breaker the combination of fixed terminals and a laminated member pivotally secured to the base on an axis parallel with the base and rotatably movable in a plane parallel to a plane embracing or passing through said fixed terminals to and away from said fixed terminals, and an actuating member having power-multiplying connection between the base and the laminated member.

21. In an automatic magnetic circuit-breaker, the combination of fixed terminals, a laminated member pivotally secured to the base on an axis parallel with the base, having rotatable movement in a plane parallel to a plane embracing or passing through the fixed terminals to and away from the fixed terminals, and an actuating member pivotally secured to the base and having power-multiplying connection with the laminating member.

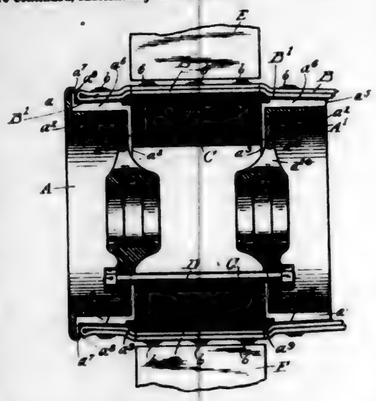
22. In an electric switch, the combination of fixed terminals, a movable laminated bridge coöperating therewith and pivotally secured to the base on an axis parallel with the base, a manually-operative actuating member having toggle connection with the bridge, spring means for actuating the movable bridge, latching means for normally restraining said actuation and automatic magnetic means for actuating the restraining means.

23. In an electric switch, a base, contact-blocks mounted thereon, one vertically above the other, a bracket on said base, a laminated bridging member pivoted in said bracket on an axis parallel with the base, and rotatable in a plane at right angles to the plane of the base to and away from the main contact-blocks, and a power-multiplying connection with said bridging member.

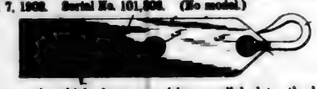
704,975. ARMATURE. FRANK L. SIMMON, Oakpark, Ill., assignor to Siemens & Halske Electric Company of America, Chicago Ill., a Corporation of Illinois. Filed May 20, 1899. Renewed Mar. 24, 1902. Serial No. 100,982. (No model.)

Claim.—1. An armature comprising end spiders and an intermediate core and windings extending across the periphery of the core and spiders, and provided with ventilating air ducts or channels extending outwardly between the spiders and core and then laterally along the spiders beneath the windings, and an annular flange on the end of one spider for directing the air-currents outwardly against the surrounding portions of the machine, substantially as described.

2. The combination with the spiders A and A', core C and windings B, of the ribs a^3 and a^4 forming the air-ducts a^5 and a^6 between the spiders and core and beneath the windings, annular flange a^7 provided with an inturned lip a^8 and along the inner surface of which the air-ducts are continued, substantially as described.

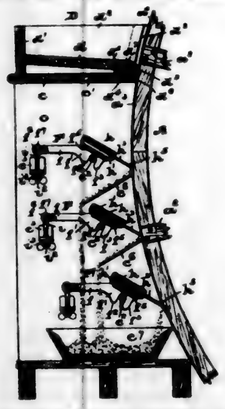


704,976. VEHICLE-DRAG. SIMON S. SEARLEY, Tyrone, Pa. Filed Apr. 7, 1902. Serial No. 101,808. (No model.)



Claim.—A vehicle-drag comprising parallel plates the lower edges of which are sharpened and the upper edges of which are arranged in a horizontal plane throughout their entire lengths, said plates being pointed at one end, sleeves located between the plates, a checking device in the form of a hook made integral with one of said sleeves and bolts passed through said sleeves and provided with nuts, the nuts being adapted to clamp the plates to said sleeves and to hold the hook in its adjusted position, substantially as set forth.

704,977. APPARATUS FOR DESICCATING EGGS. PERCY R. TAYLOR, Newark, N. J., assignor to the Pure Food Company, a Corporation of New Jersey. Filed Nov. 5, 1898. Serial No. 736,344. (No model.)



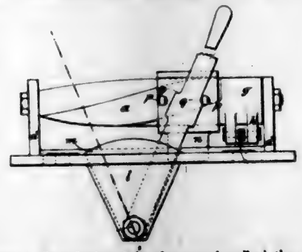
Claim.—1. In an apparatus for the desiccation of eggs, or other substances, the combination, with a drying drum or wheel, and means for actuating the same, of a frame or support, and a pivotally-arranged scraping device or devices in said frame or support, consisting, essentially of a pair of arms f, each arm having an angular portion f' and an open part or slot f^4 for pivotally arranging said scraping device or devices on a support in said frame, a pair of top pieces connected with said portions f', and spring fingers or blades between said top pieces in operative contact with the drying-surface of said drum or wheel, and means connected with said device or devices for regulating the pressure of said spring fingers or blades against said drying-surface, substantially as and for the purposes set forth.

2. In an apparatus for the desiccation of eggs, or other substances, the combination, with a drying drum or wheel, and means for actuating the same, of a frame or support, and a pivotally-arranged scraping device or devices in said frame or support, consisting, essentially of a pair of arms f, each arm having an angular portion f' and an open part or slot f^4 for pivotally arranging said scraping device or devices on a support in said frame, a pair of top pieces connected with said portions f', and spring fingers or blades between said top pieces in operative contact with the drying-surface of said drum or wheel, and means connected with said device or devices for regulating the pressure of said spring fingers or blades against said drying-surface, consisting, of plates or brackets attached to the sides of said frame or support, and a screw connection between said plates or brackets and the said arms f of the scraping device or devices, substantially as and for the purposes set forth.

3. In an apparatus for the desiccation of eggs, or other substances, the combination, with a drying drum or wheel, and means for actuating the same, of a frame or support C, and baffle-plates c^3 in said support, a scraping device or devices in said support, and spring-fingers on said scraping device or devices in operative contact with the drying-surface of said wheel or drum, substantially as and for the purposes set forth.

4. In an apparatus for the desiccation of eggs, or other substances, the combination, with a drying drum or wheel, and means for actuating the same, of a main frame or support, a pair of side pieces to said frame or support, a supporting-rod extending from side to side in said frame or support, and a scraping device on said supporting-rod, consisting, essentially, of a pair of arms provided with means for pivotally supporting said arms on said supporting-rod, a brace at the end of each arm, a pair of top pieces secured to said braces, and a number of spring-fingers secured between said top pieces, in such a manner, that intervening spaces will be formed between the adjacent fingers, and means connected with said arms for regulating the pressure of said spring-fingers against the surface of said drying drum or wheel, consisting, of brackets c^3 secured to the inner surfaces of the side pieces of the main frame or support, each bracket having a slotted portion, and an eyebolt connected with one end of each of said brace-carrying arms, said eyebolts being removably arranged in the slotted portions of said brackets c^3, and a thumb-screw on each eyebolt, all arranged, substantially as and for the purposes set forth.

704,978. SHUNTING-LEVER. WILLIAM TAYLOR, Sandhacre, England. Filed Dec. 23, 1901. Serial No. 87,019. (No model.)



Claim.—1. In a device of the character described, the combination with a longitudinally-slotted bed-plate and a screw movably supported thereon, of a nut arranged on the screw, a lever pivoted at one end at a point below the bed-plate and passing through a slot in the latter, said lever loosely engaging one of said parts to turn the other, and a pitman connected to the part that is to be turned and arranged to be reciprocated by the turning movement of said part, substantially as described.

2. In a device of the character described, the combination with a bed-plate and a screw journaled in bearings thereon, of a nut movably fitted on said screw, a lever for reciprocating the nut, and projections on the nut between which said lever is disposed, said lever being provided with shoulders arranged to interlock with said projections, substantially as described.

3. In a device of the character described, the combination with a longitudinally-slotted bed-plate and a screw journaled in bearings thereon, of a nut movably fitted on said screw and provided with a rib movably fitted in said slot, and a lever for reciprocating the nut, substantially as described.

4. In a device of the character described, the combination with a longitudinally-slotted bed-plate and a screw journaled in bearings thereon, of a nut movably fitted on said screw, a lever pivoted at one end at a point below the bed-plate and provided at its opposite sides with shoulders, and projections on the nut between which said lever is movably disposed and with which said shoulders are adapted to interlock, substantially as described.

704,979. DEVICE FOR TEACHING ARITHMETIC. JOSÉ J. TERRAZAS, Mexico, Mexico. Filed June 3, 1901. Serial No. 62,972. (No model.)

Claim.—1. A table for teaching arithmetic, comprising a series of consecutive spaces which increase or decrease in value in fixed ratio and are distinguishable by contrasting colors.

2. A table for teaching arithmetic, comprising consecutive spaces disposed in columns and rows and subdivided into sections, the spaces of the consecutive sections being of higher value than those in the preceding section or sections.

3. A table for teaching arithmetic, comprising rows and columns of consecutive spaces disposed in parallel and intersecting order, said spaces being distinguishable by contrasting colors and the spaces being grouped into consecutive sections, the spaces of said consecutive sections being of higher value than the spaces of the preceding section or sections.

4. A table for teaching arithmetic, comprising a series of consecutive squares or spaces distinguishable by contrasting colors, the initial space of which bears the indication "0."

5. A table for teaching arithmetic, comprising consecutive number squares or spaces disposed in a plurality of intersecting series of parallel lines, said squares being of at least three colors or shades alternating in regular succession.

6. A table for teaching arithmetic, comprising consecutive number squares or spaces disposed in a plurality of intersecting series of parallel sets, and parallel lines separating sundry of the said sets at regular intervals, said lines being distinguished from each other in regular succession.

7. A table for teaching arithmetic, comprising a plurality of similar sections each having squares or spaces disposed in parallel series, the series of the sections alining with each other, or being located one in the continuation of the other, and each series of one section bearing the same numbers as that series of the adjacent section which is adjoining to the alining series of said section.

8. A table for teaching arithmetic, comprising a plurality of similar sections each having squares or spaces disposed in rows and columns, the rows of the sections alining with each other, and each row of one section bearing the same numbers as the next row above of an adjacent section.

9. A table for teaching arithmetic, comprising a plurality of similar sections each having consecutively-numbered squares or spaces disposed in rows and columns, the rows of the sections alining with each other, and each row of one section bearing the same numbers as the next row above of an adjacent section.

10. A table for teaching arithmetic, comprising a plurality of similar sections each having squares or spaces disposed in rows and columns, and of at least three colors and shades alternating in regular succession, the squares of the same color alining diagonally, the rows of the sections alining with each other and each row of one section bearing the same numbers as the next row above of an adjacent section.

11. A table for teaching arithmetic, comprising a plurality of similar sections each having squares or spaces disposed in rows and columns, and of at least three colors and shades alternating in regular succession, the squares of the same color alining diagonally, the rows of the sections alining with each other and each row of one section bearing the same numbers as the next row above of an adjacent section, and lines arranged

at regular intervals and separating the said rows and columns into groups, said lines being distinguished from each other in regular succession.

12. A table for teaching arithmetic, comprising a plurality of similar sections each having squares or spaces disposed in rows and columns, the rows of the sections alining with each other, and each row of one section bearing the same numbers as the next row above of an adjacent section, in combination with an auxiliary table consisting of a series of squares arranged like those of the initial column of one of the sections, and another series of squares bearing in regular repetition from a central starting-point, the same numbers as the initial row of one of the sections.

13. A table for teaching arithmetic, comprising a plurality of similar sections each having squares or spaces disposed in rows and columns, and of at least three colors or shades alternating in regular succession, the squares of the same color alining diagonally, the rows of the sections alining with each other and each row of one section bearing the same numbers as the next row above of an adjacent section, in combination with an auxiliary table consisting of a series of differently-colored squares arranged like those of the initial column of one of the sections, and another series of squares of different colors in regular succession and bearing in regular repetition in both directions from a central starting-point, the same numbers as the initial row of one of the sections.

704,980. SHOESTRING. JOHN T. THOMPSON, St. Paul, Minn. Filed June 4, 1901. Serial No. 62,119. (No model.)

Claim.—1. A shoe-lacing consisting of a hollow body, and a flat strip closely fitted within, and filling, said body.

2. A shoe-lacing consisting of a hollow body, and a strip fitting therein, said strip terminating short of those portions of the ends of the lacings which are ordinarily tied into a bow.

3. A shoe-lacing consisting of a hollow body, a strip fitted therein, said strip terminating short of those portions of the ends which are ordinarily tied into a bow, said strip having its ends gradually tapered.

704,981. BURGLAR-ALARM. WILLIAM B. THOMAS, Towns, Ga. Filed June 17, 1901. Serial No. 64,904. (No model.)

Claim.—1. In a burglar-alarm, the combination of an endwise-movable firearm, means operable by the opening of a closure for imparting endwise movement to the firearm to project the same into range with respect to the closure, and fixed means located in the path of the endwise movement of the firearm to effect explosion of the contained charge.

2. In a burglar-alarm, the combination of an endwise-movable firearm having firing mechanism, means operable by the opening of a closure to project the firearm forwardly and into range with respect to the closure, hammer-cocking means located in the path of a portion of the hammer of the firing mechanism to cock the hammer, and means carried by the firearm to trip the hammer-cocking means and thereby effect explosion of the contained charge.

3. In a burglar-alarm, the combination with a window-sash, of a burglar-alarm comprising a base secured adjacent to the sash, an endwise-movable firearm supported by the base, fixed hammer-cocking mechanism, means carried by the base to project the firearm, and a trip connection between the latter means and the window-sash.

4. A burglar-alarm comprising a base, a slide operatively connected therewith, a firearm supported by the slide, and a hammer carried by the firearm, hammer-cocking mechanism carried by the base and in operative relation to the hammer, and slide-actuating mechanism carried by the base.

5. A burglar-alarm comprising a fixed base, a slide operatively connected therewith and supporting a firearm, hammer-actuating mechanism carried by the base, an actuating-lever also carried by the base and having one arm in engagement with the slide, and means connecting with the other arm to effect operation of the device.

6. In a burglar-alarm, a base, a firearm supported thereby and comprising a breech and a barrel, a spring-pressed hammer housed in the breech, a relatively fixed arm carried by the base and having a scar engaging the hammer, a trigger carried by the breech, and means for projecting the firearm whereby to effect explosion of the contained charge.

7. A burglar-alarm comprising a base, a firearm supported thereby, a hammer carried by the firearm, an arm carried by the base and having a scar to engage the hammer, and means for projecting the firearm, said arm being adapted for limited movement before exerting any action on the hammer.

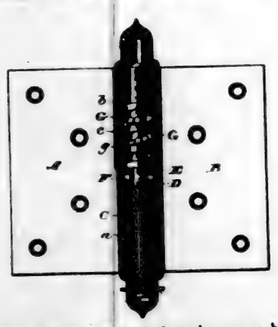
8. In a burglar-alarm, a firearm comprising a breech and a barrel suitably connected, the breech having a slot in one side thereof, a hammer mounted in the breech and having a firing-pin and a projection extending through the slot, a sliding arm having a scar to engage a depression in the hammer and to bear against the said projection, a trigger carried by the breech, and means for projecting the firearm to move the trigger into engagement in the sliding arm thus to release the hammer.

9. In a burglar-alarm, a base having a slide associated therewith and supporting a firearm and means carried by the base to operate the firing mechanism thereof, a trip-lever pivoted on the base to project the slide, and a stop on the base to limit the movement of the lever.

10. In a burglar-alarm, a firearm comprising a breech and a barrel, the breech being provided on one side with a slot, a hammer having a curved projection to cover the slot and provided with a pin to extend therethrough and with a recess adjacent to the pin, an arm having a scar to engage the recess in the hammer and to bear against the pin, and means for projecting the barrel.

11. In a burglar-alarm, a base have a slide associated therewith and supporting a firearm, a lever pivoted on the base and having one member connected with the slide, a stop on the base to limit the movement of the lever, and an arm connected with the other member of the lever and having its free end provided with means to engage a fixed object, the device, when so employed, constituting a window-lock.

704,982. HINGE. WILLIAM H. THEZ, Beaverdam, Wis. Filed Oct. 31, 1901. Serial No. 80,581. (No model.)



Claim.—1. A hinge composed of two leaves, one having a barrel with a plain bore and the other having a barrel with an internal spiral groove, a pin fitted to turn in both barrels and provided with spirally-arranged antifriction-rollers adapted to engage with said spiral groove, and means for locking at will said pin from turning in the barrel having a plain bore, substantially as described.

2. A hinge composed of two leaves, one having a barrel with a plain cylindrical bore and the other having an internal spiral groove in the bore of its barrel, a pin having a cylindrical portion fitted to turn in said plain bore in one leaf and spirally arranged antifriction-rollers adapted to engage said spiral groove in the other leaf, a nut threaded on the lower end of said pin and adapted when screwed up against the lower end of the barrel of the fixed leaf to prevent said pin from turning therein, substantially as described.

3. In a hinge the combination of a fixed leaf having a barrel with a plain cylindrical bore and roller-bearing, a movable leaf having a barrel with an internal spiral groove, a pin having a cylindrical lower portion fitted to turn in the barrel of the fixed leaf, spirally-arranged rollers adapted to engage the spiral groove in the movable leaf and an intermediate roller-bearing opposed to the roller-bearing in the barrel of the fixed leaf, rollers interposed between said bearings and means for locking said pin at will from turning in the barrel of the fixed leaf, substantially as described.

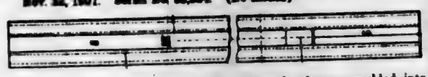
4. In a hinge the combination of a fixed leaf having a barrel with a plain cylindrical bore, a movable leaf having a barrel with an internal square spiral groove, a pin having a cylindrical part fitted to turn in the plain bore of the fixed leaf and provided with a square spiral corresponding with but narrower axially than said groove, and balls interposed between the upper face of the spiral on the pin and the upper opposing face of said groove, substantially as described.

5. In a hinge the combination of a fixed leaf having a barrel with a plain bore, a movable leaf having a barrel with an internal spiral groove, a pin having a cylindrical part fitted to turn in the plain bore of the fixed leaf, and a spiral adapted to engage the spiral groove in the movable leaf, rollers interposed between opposing bearings in the barrel of the fixed leaf and on the hinge-pin, and means for locking at will said hinge-pin in said fixed leaf, substantially as described.

6. In a hinge the combination of a fixed leaf having a barrel with a plain bore, a movable leaf having a barrel with an internal spiral groove, a pin having a cylindrical part fitted to turn in the plain bore of the fixed leaf, and a spiral adapted to engage with the spiral groove in the movable leaf, a nut threaded on the lower end of said pin, and a pin passing transversely through said nut and a circumferential groove in the hinge-pin, substantially as described.

7. In a hinge the combination of a fixed leaf having a barrel with a plain bore, a movable leaf having a barrel with an internal spiral groove, a pin having a cylindrical part fitted to turn in the plain bore of the fixed leaf, and a spiral adapted to engage with the spiral groove in the movable leaf, a nut threaded on the lower end of said pin and adapted to lock the same in the fixed leaf, and a nut threaded in the upper end of the barrel of the movable leaf and having an axial socket in which the upper end of the hinge-pin has a bearing, substantially as described.

704,983. FENCE-POST. JAMES W. TODD, Ossaburg, Ohio. Filed Nov. 22, 1901. Serial No. 83,234. (No model.)

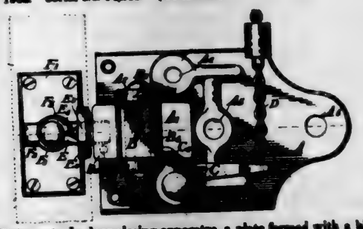


Claim.—1. A post composed of a mineral substance molded into form and provided with a longitudinal V-shaped groove the angle at the point of the V being a right angle, and having longitudinal retaining-lips at the outer edges of the groove; substantially as described.

2. A post composed of a mineral substance molded into form and provided with a central longitudinal opening and with a V-shaped longitudinal groove, the angle at the point of the V being a right angle, and having longitudinal retaining-lips at the outer edges of the groove: substantially as described.

3. A post composed of a mineral substance molded into form and provided with a longitudinal V-shaped groove in one of its surfaces, the angle at the point of the V being a right angle, and having longitudinal retaining-lips at the outer edges of the groove, and a step formed of the same material and constituting a homogeneous portion of the post inserted in the longitudinal groove near the base of the post, for supporting the fence-strip which said groove is adapted to contain; substantially as described.

704,984. DOOR-CLOSING APPARATUS. JACOB W. THIPP, New York, N. Y., assignor to Henry B. Newhall, Plainfield, N. J. Filed Feb. 15, 1902. Serial No. 94,218. (No model.)



Claim.—1. In door-closing apparatus, a plate formed with a block-opening, trunnion-supports on either side of said opening, a trunnion-block pivoted to said supports to rotate in said opening, said trunnion-block being formed with a lip on its front edge, with a heel on its rear edge and with a side face substantially perpendicular to said heel, lever-bearings formed in said plate on either side of said opening, a symmetrical locking-lever formed with a toe to engage said trunnion-block to be pivotally mounted on either of said lever-bearings, a thermal releasing device including a weight connected with the free end of said locking-lever, said weight serving to disengage said locking-lever from said trunnion-block by impact, a latch pivoted to a latch-support, a spring tending to rotate said latch about its pivot, said latch having a tongue to engage the lip of said trunnion-block and a handle to manually operate said latch, said handle having locking-legs to engage the lip of said trunnion-block.

2. In a door-closing apparatus, a plate provided with a block-opening, a trunnion-block pivotally mounted to rotate in said opening, said trunnion-block being formed with a lip on the front edge of the same, said lip having a projection upon its under surface, said trunnion-block having a rib to engage said plate to maintain said lip in proper position, a locking-lever pivoted to said plate and provided with a toe to engage said trunnion-block, when the heel of said trunnion-block is engaged by said locking-lever, said trunnion-block having a side at an angle to the heel of the same to be engaged by the toe of said locking-lever to maintain the lip of said trunnion-block at an angle to said plate, a manually-movable latch to be secured to a door, said latch having a tongue and a handle at right angles to said tongue, said handle having locking-legs on its under surface.

3. In door-closing apparatus, a plate provided with a block-opening, a trunnion-block pivoted to rotate in said opening, said trunnion-block having a lip to be engaged by a latch, a locking-lever mounted on said plate to engage said trunnion-block and to rigidly hold the lip of said trunnion-block parallel to said plate or at an angle thereto and a manually-movable latch having projections to be engaged by said lip.

4. In door-closing apparatus, a plate provided with a block-opening, a trunnion-block movably mounted in said opening, said trunnion-block having a lip to be engaged by a latch, releasable means to hold the lip of said trunnion-block parallel to said plate or at an angle thereto and a manually-movable latch having projections to be engaged by said lip.

5. In door-closing apparatus, a plate, a trunnion-block mounted in said plate and having a lip to project adjacent to the path of travel of a door, a locking-lever mounted on said plate to engage said trunnion-block and hold said lip in position, a manually-movable latch to be secured to the edge of said door, said latch having a tongue to project beyond the line of travel of said door and into engagement with said lip, and a spring to move said tongue into the line of travel of said door.

6. In door-closing apparatus, a trunnion-block provided with a lip, means to mount said trunnion-block adjacent to the path of travel of a door, releasable means to hold said lip in position, a manually-movable latch to be mounted upon the edge of said door, said latch projecting beyond the line of travel of said door into engagement with said lip and means to move said latch into said line of travel.

7. In door-closing apparatus, releasable means mounted adjacent to the path of a self-closing door to hold said door in open position, a manually-movable latch secured to said door to project beyond the line of travel of said door into engagement with said means, said latch automatically moving when released into said line of travel.

8. In door-closing apparatus, a lip releasably held adjacent to the path of a self-closing door, manually-movable means mounted upon said door to project out of the line of travel of said door into engagement with said lip, said means automatically moving into the line of travel of said door when released from said lip.

9. In door-closing apparatus, a lip to be releasably held adjacent to the line of travel of a self-closing door and manually-movable means to be secured to a self-closing door to project out of the line of travel of said door into engagement with said lip.

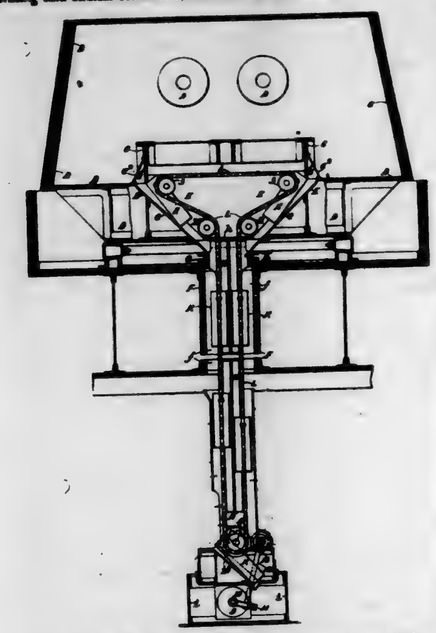
10. In door-closing apparatus, a plate, a lip movably mounted on said plate, means to hold said lip rigidly parallel to said plate or perpendicular to the same, and a latch having projections thereon to engage said lip in either position.

704,985. AMMUNITION-HOIST FOR ORDNANCE. EUGÈNE TROCHAIN, Paris, France, assignor to Vickers Sons & Maxim, Limited, London, England, a Corporation of Great Britain. Filed Oct. 17, 1900. Serial No. 733,008. (No model.)

Claim.—1. In combination with the magazine and rotating firing-platform, of a hood arranged to rotate with said platform and having inclines, a trunk depending from said hood, a bracket located at the magazine, a distance-piece extending between the bracket and hood and dividing the trunk into two chambers, an endless connector traveling in said chambers, carriers pivoted to said connector and arranged to be tilted by said inclines, and means for operating said endless connector, substantially as described.

2. In combination with the magazine and rotating firing-platform, of a hood arranged to rotate with said platform and having inclines, a trunk depending from said hood, a revolvable hollow bracket located at the magazine, inclines carried by said bracket, a distance-piece extending between the bracket and hood and dividing the trunk into two chambers,

an endless connector traveling in said chambers, carriers pivoted to said connector, and arranged to be tilted by said inclines, and means for operating said endless connectors, substantially as described.



3. In combination with the magazine and rotating firing-platform, of a hood arranged to rotate with said platform, a trunk depending from said hood, a tubular bracket-carrier at the lower end of said trunk and forming a continuation thereof and revolvable therewith, said bracket being vertically movable in relation to the trunk, driving and guide sheaves carried by said hood and bracket, endless carriers traveling over said sheaves, and means for moving said bracket downward to tighten said endless carrier.

4. In combination, the hoist-trunk, the bracket forming a continuation thereof, and revolubly seated at the magazine, inclines carried thereby, and endless carriers in said trunk having buckets adapted to be tilted by said inclines, substantially as described.

5. In combination, the hood, the hoist-trunk, the bracket at the lower end of said trunk, the distance-piece within the trunk and united at its opposite ends to said hood and bracket and forming two chambers, and the endless carrier traveling in said compartments, substantially as described.

6. In combination, the hoist-trunk, the distance-piece therein dividing said trunk into two chambers, a revolvable bracket at the magazine and adapted to rotate with said trunk but movable axially thereof, and endless carrier-chains supported in said trunk and adapted to be tightened by the axial movement of said bracket, substantially as described.

704,986. TELEPHONE-BOOTH. FRANK L. TUPTS, New York, N. Y., assignor of one-third to Herschel C. Parker, New York, N. Y. Filed Nov. 5, 1901. Serial No. 81,222. (No model.)

Claim.—1. The combination of a plurality of telephone-booths placed in juxtaposition and provided with curved walls.

2. A group of independent telephone-booths, each provided with means of ingress and egress, and each provided with curved walls.

3. A group of telephone-booths, each booth being essentially cylindrical, and said booths being grouped.

4. A group of telephone-booths, each booth being essentially cylindrical, and the booths being placed back to back.

5. An improved telephone-booth for resisting sound-vibrations, said booth having a suitable door and constructed with its inner walls curved.

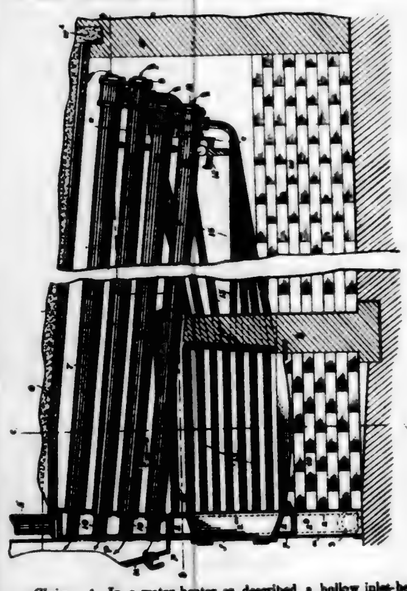
6. An improved telephone-booth constructed with curved walls, and with a sliding door conforming essentially to the curvature of the booth.

704,987. TELEPHONE-BOOTH. FRANK L. TUPTS, New York, N. Y., assignor of one-third to Herschel C. Parker, New York, N. Y. Filed Dec. 24, 1901. Serial No. 87,056. (No model.)

Claim.—1. A telephone-booth comprising an inner structure formed with curved walls, and an outer flat-sided structure inclosing the said inner structure.

2. The combination of a double-walled booth provided with suitable means of ingress and egress, the inner wall being curved and the outer walls being flat.

704,988. HEATER. WESLEY R. VANSTONE, New Westminster, Canada. Filed Sept. 25, 1901. Serial No. 76,572. (No model.)



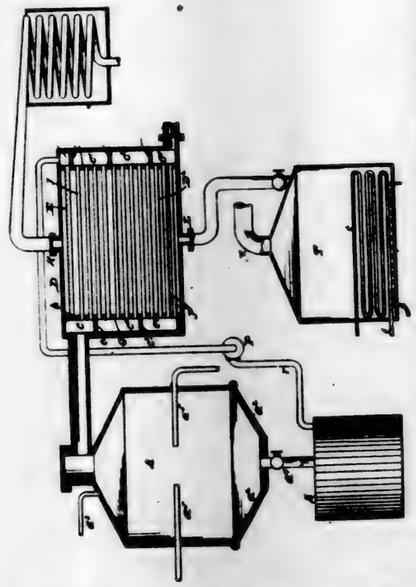
Claim.—1. In a water-heater as described, a hollow inlet-header forming the front of the furnace-chamber and having an inlet-pipe through which water is introduced; a similar outlet-header above and resting on the foregoing, provided externally with a smoke-uptake and having an outlet-pipe for the conveyance of the heated water; a flue-chamber, a series of water-jacketed flue-tubes communicating from the rearward end of the flue-chamber through the outlet-header to the uptake, the water-jackets being in connection with the water-space of the outlet-header; and means whereby each rearward end of the flue-tube water-jackets may be connected to the water-space of the inlet-header by pipes forming the sides and back of the furnace.

2. In a water-heater of the class described, having a furnace and flue chamber inclosed; a hollow inlet-header forming the front of the furnace and adapted to receive the return water; a similar outlet-header resting on the foregoing, adapted to receive the water when heated and deliver it to the exterior distributing-pipes; a series of flue-tubes adapted to convey the products of combustion from the rearward end of the flue-chamber through the outlet-header to the smoke-uptake; exterior tubes surrounding each flue-tube and forming a water-jacket therefor from the inner wall of the outlet-header to the rearward end of the flue-tube; a series of pipes fixed in the inner wall of the inlet-header on each side of the furnace-doorway, and passing along on each side of the furnace bent across each to the opposite side at the back of the furnace and thence proceeding and being connected to the rear end of the flue-tube jackets so that water may be continually circulated through furnace-tube and jacket from inlet to outlet header, and a return-bend pipe on each side from the upper part of the inlet to the lower part of the outlet headers, substantially as described.

3. In a heater as described having a hollow header from which project a series of jacketed flue-tubes to within the flue-chamber; a cross-beam below the farther end of such tubes; grooved rollers on such beam supporting the tubes, and intermediate rollers between each horizontal row of tubes, whereby the overhanging weight of the tubes is supported while they are free to expand and contract freely.

4. In a water-heater as described, in combination, the inlet-header 2, surrounding the furnace and ash-pit doorways and forming the front of the furnace; and the outlet-header 4 surmounting the same, the flue-tube 10, and the jacket-tube 7, the terminal T's 8; junction-sleeves 9, water-tubes 15, secured in the inlet-header and passing along the sides and across the back of the furnace, and thence to the terminal T of the jacket-tubes; junction-bushings 11, return-bends 16, connecting the upper side of the inlet with the lower side of the outlet headers on each side of the furnace, substantially as described.

704,989. PROCESS OF EXTRACTING OIL. LA FAYETTE D. VORCE, Chicago, Ill. Filed Oct. 29, 1900. Serial No. 34,688. (No specimens.)



Claim.—1. The process of extracting and recovering soluble matters from material containing the same, which consists in subjecting the material in a closed extraction-chamber to the action of a volatile solvent, educting the solution thus obtained and subsequently passing it into a volatilizing-chamber, then passing into the exhausted material in the extraction-chamber a volatilizing agent, such as steam, and volatilizing the residual solvent left in the material, conducting said heating agent and vapor into the volatilizing-chamber and there utilizing their heat to volatilize more or less of said solvent from said solution, and conducting said partially-condensed vapors thence to a condenser or separator.

2. The process of extracting and recovering soluble matters from material containing the same, which consists in subjecting the material in a closed extraction-chamber to the action of a volatile solvent, educting the solution thus obtained, then passing into the exhausted material in the extraction-chamber a heated volatilizing agent, such as steam, and volatilizing the residual solvent in the mass, conducting the heating agent and vaporized solvent into a volatilizing-chamber and heating the same thereby, conducting the solution of solvent and extracted matter into the volatilizing-chamber and there exposing it to the heat of said vaporized solvent and heating agent, whereby more or less of the solvent is volatilized from said solution and said heating-vapors are partially or wholly condensed, conducting said partially-condensed vapors to a condenser or separater.

3. The process of extracting and recovering soluble matters from material containing the same, which consists in subjecting the material in a closed extraction-chamber to the action of a volatile solvent, educting the solution thus obtained and then passing into the exhausted material in the extraction-chamber a heated volatilizing agent, such as steam, and volatilizing the residual solvent left in the material, conducting said heating agent and vapors into a volatilizing-chamber through closed pipes, passing the educted solution into the volatilizing-chamber and causing the same to therein flow in thin layers over the pipes containing the heating agent and vapors, thereby more or less completely volatilizing the solvent from said solution and partially or completely condensing said heating agent and vapors, and conducting said partially-condensed vapors to a condenser or separator.

4. The process of extracting and recovering soluble matters from material containing the same, which consists in subjecting the material in a closed extraction-chamber to the action of a volatile solvent, educting the solution thus obtained and subsequently passing it into a volatilizing-chamber, then passing into the exhausted material in the extraction-chamber a volatilizing agent, such as steam, hot air, gas or other heating agent and volatilizing the residual solvent left in the material, conducting said heating agent and vapors into the volatilizing-chamber and there utilizing their heat to volatilize more or less of said solvent from said solution, conducting said partially-condensed vapors thence to a condenser or separator, and then completing the volatilization of the solvent from the solution by the application of heat from a different source.

5. The process of extracting and recovering soluble matters from material containing the same, which consists in subjecting the material in a closed extraction-chamber to the action of a volatile solvent, educting the solution thus obtained, then passing into the exhausted material in the extraction-chamber a heated volatilizing agent, such as steam, and volatilizing the residual solvent in the mass, conducting the heating agent and vaporized solvent into a volatilizing-chamber and heating the same thereby, conducting the solution of solvent and extracted matter into the volatilizing-chamber and there exposing it to the heat of said vaporized solvent and heating agent, whereby more or less of the solvent is volatilized from said solution and said heating-vapors are partially or wholly condensed, conducting said partially-condensed vapors to a condenser or separater, and then completing the volatilizing of the solvent from the solution by the application of heat from another source.

6. The process of extracting and recovering soluble matters from material containing the same, which consists in subjecting the material in a closed extraction-chamber to the action of a volatile solvent, educting the solution thus obtained and then passing into the exhausted material in the extraction-chamber a heated volatilizing agent, such as steam, and volatilizing the residual solvent left in the material, conducting said heating agent and vapors into a volatilizing-chamber through closed pipes, passing the educted solution into the volatilizing-chamber and causing the same to therein flow in thin layers over the pipes containing the heating agent and vapors, thereby more or less completely volatilizing the solvent from said solution and partially or completely condensing said heating agent and vapors, conducting said partially-condensed vapors to a condenser or separator, and then completing the volatilization of the solvent from the solution by the application thereto of heat from a different source.

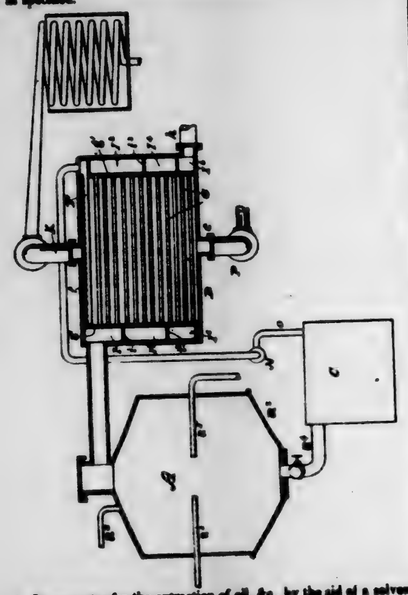
704,990. APPARATUS FOR SEPARATING SOLVENT FROM OILS. LA FAYETTE D. VORCE, Chicago, Ill. Filed Oct. 31, 1900. Serial No. 35,007. (No model.)

Claim.—1. In an oil-extracting apparatus a percolating-tank and an oil and solvent tank open thereto, in combination with a separator connected with the top of said percolator, means to penetrate the percolator with steam to vaporize off the solvent to said separator, and a pump and connections between said oil and solvent tank and the separator.

2. In apparatus for the extraction of soluble matters by the aid of solvents the combination with the percolaters in which the extraction is conducted of a separator through which the steam and vaporized solvent from the percolators are passed, a spraying apparatus to which the solution of solvent and extracted matter from the percolators is conducted and by which the solution is caused to drip upon the condenser-coils, means for introducing the vapors from the percolater into the heating-tubes of the separator, and means for collecting the extracted matter and the volatilized solvent separately.

3. In apparatus for the extraction of oil, &c., by the aid of a solvent the combination with the percolaters in which the extraction is conducted of a separator comprising a closed chamber having therein pipes through which the steam and vaporized solvent from the percolaters are passed and a spraying device above said pipes to which the solution of oil and solvent from the percolators is conducted, means for introducing the va-

pors from the percolator into the heating-pipes of the separator, and means for collecting the extracted matter and the solvent separately, substantially as specified.



4. In apparatus for the extraction of oil, &c., by the aid of a solvent the combination with the percolator having steam-intromitting pipes, of a separator comprising a closed chamber having at the top a spraying device and beneath the same a series of separated pipes extending completely through the chamber, a connection from the top of the percolator to said pipes, a pipe for supplying the solution of extracted matter to said spraying device, separate outlets from said chamber for the extracted matter and the vaporized solvent, and means for collecting the condensed steam and solvent from said pipes, substantially as described.

5. In apparatus for the extraction of oil, &c., by aid of a solvent the combination with the percolators having steam-intromitting pipes of a separator comprising a closed chamber having at the top a spraying device and beneath the same a series of separated pipes extending completely through the chamber and opening into chambers which communicate with part only of said pipes, a connection from the top of the percolator to said pipes, a pipe for supplying the solution of extracted matter to said spraying device, separate outlets from said chamber for the extracted matter and the vaporized solvent, and means for collecting the condensed steam and solvent from said pipes, substantially as described.

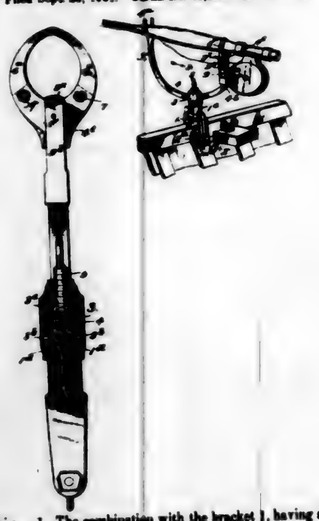
6. In oil-extracting apparatus, a separator having a separated internal chamber and flues separated from each other leading therethrough and open at both ends into a space within the outer walls of the separator, and two sets of inlets and outlets to the separator, in combination with a percolator having steam-intromitting pipes, a vapor connection therefrom to one of the end spaces, and a connection from the inlet of the internal chamber to the supply of oil solution, substantially as described.

7. In oil-extracting apparatus, a separator having inlet and outlet openings, and an interior chamber with its own outlet and inlet openings, pipe connections to all said openings, a set of open-ended flues traversing the interior chamber and not connected together, a fluid-discharge pipe entering said interior chamber over said flues and connecting with the oil-solution supply, a percolator having steam-intromitting pipes, and a vapor-pipe connecting said separator with the percolator, substantially as described.

8. In an oil-extracting apparatus, a combined separator and condenser having an interior chamber with inlets and outlets through the walls thereof, a series of separate open-ended condenser-pipes extending through said interior chamber and open at both ends into a space within the outer walls of the separator, in combination with a percolator having steam-intromitting pipes, a vapor-pipe from said percolator to one of said end chambers of the separator, a receiving-tank, a pipe therefrom communicating with said interior chamber over the tubes therein, a pump in said pipe, and an outlet from one of said end chambers for the contents of said condenser-pipes, substantially as described.

9. The combined separator and condenser, comprising a central chamber having at its top a spraying device and at each end partitioned chambers inclosed within the outer shell, open-ended condenser-pipes separate from each other and extending through said central chamber into the end chambers, outlets at top and bottom of said central chamber, a vapor-inlet to one of said end chambers and a liquid-outlet from another, in combination with a percolator having steam-intromitting pipes, a vapor-pipe from said percolator to the vapor-inlet of the separator, a combined solvent and oil tank, a pipe from said tank to said spraying device, and a pump in said pipe, substantially as described.

704,991. FISHING-ROD HOLDER. BERNARD J. WARREN, Dover, Me. Filed Sept. 23, 1901. Serial No. 76,236. (No model.)



Claim.—1. The combination with the bracket 1, having a laterally-projecting hub, a headpiece rotatably mounted on the hub, said headpiece having slots extending from the lower end upward, and a transverse socket at a point above the hub-head; of the yoke-frame movable in the said transverse socket, adapted to be slipped up into the socket through the slots in the side of the head, said frame having rod-rests on the outer ends, and means on the head for clamping the frame against the hub-head, for the purposes described.

2. In a rod-holder of the character described, a supporting member, a yoke-frame having an inner and an outer rod-rest, one of said rests including jaws, automatically closable over the rod when seated therein, and finger-operated means for moving the jaws to an open position, as set forth.

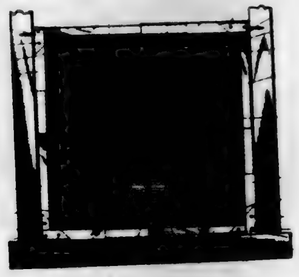
3. In a rod-holder of the character described, a supporting member having a rod-rest, said rest including a pair of pivoted jaws, adapted to close over the rod-butt, and a slide-plate connecting with the jaws and adapted to move said jaws to their open or closed position by alternate movement, as set forth.

4. The combination with the frame 4, having a vertical arm 4^b, said arm having a vertical slot, in its upper end; of the jaws pivotally mounted on the arm 4^b, the lower ends of said jaws lapping each other and each having a slot extended diagonally to the slot in arm 4^b; of the vertically-shiftable member 9, having a stud-bolt 8, held to play in the slot in member 4^b, and the slots in the pivotal jaws, said member 9 having a lift-piece 9^x, all being arranged substantially as shown and for the purpose described.

704,992. WINDOW-SCREEN. CLAUDE R. WARNER, Avon, Ill. Filed Oct. 14, 1901. Serial No. 78,561. (No model.)

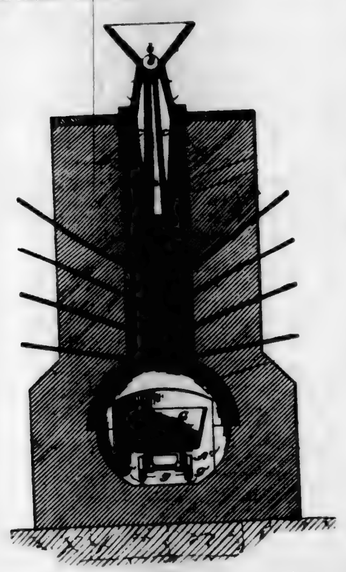
Claim.—1. A window-screen, comprising a rectangular piece of screen wire-cloth, and a sheet-metal border-frame therefor, each bar of said frame comprising two telescoping sections, substantially U-shaped in cross-section, one section having return-bent flanges extended inward and upward and embracing the edges of the other section that slides between them, said flanges also clamping upon an appropriate edge of the screen material.

2. A window-screen comprising a rectangular piece of screen wire-cloth, a border-frame of sheet metal, each side bar of the frame comprising two substantially U-shaped sections that slide one upon the other, a triangular corner-plate for each corner of the frame, secured between the screen-cloth and the lapped ends of the frame members, and means for securing said corner-plates to the frame members.



3. The combination with a window-screen, of a hand-hole closure therefor, comprising a rectangular box-like frame open on top and projected from the screen over a hand-hole, and a flap-door hinged at one edge on the frame so as to cover its opening when seated thereon.

704,993. ELECTRIC SMELTING-FURNACE. FREDERICK C. WEBER, Chicago, Ill. Filed Jan. 8, 1900. Renewed May 18, 1902. Serial No. 107,553. (No model.)



Claim.—1. In an electric smelting-furnace, the combination of a horizontally-elongated furnace-chamber, several superposed series of electrodes projected laterally into the furnace from opposite sides thereof, each series having a different angle of downward convergence in relation to the other series and toward a central space with an arcing space between the companion downward-converging electrodes of each series and forming an extended horizontal arcing space downwardly projected between the several superposed series of electrodes, and a feed or discharge for the material from above in direct line with the arcing space, substantially as described.

2. In an electric smelting-furnace, the combination of a horizontally-elongated furnace-chamber, several superposed series of electrodes projected laterally into the furnace-chamber from opposite sides thereof, each series having a downward convergence horizontally and an inward convergence at the ends of all the series with an arcing space between the companion electrodes of each series and forming an extended vertical arcing space between the several superposed series of electrodes having a downward and inward convergence toward a central space, and a feed or discharge for the material from above in direct line with the arcing space, substantially as described.

3. In an electric smelting-furnace, the combination of a furnace-chamber, several superposed series of electrodes laterally projected at different planes of inclination into the furnace-chamber from opposite sides thereof, with an arcing space between the companion electrodes of each series forming a vertical downwardly projected and extended unobstructed and continued smelting and arcing space between the superposed series of electrodes, and a feed or discharge for the material from above into the vertically-extended smelting and arcing space, substantially as described.

4. In an electric smelting-furnace, the combination of a furnace-chamber, several superposed series of electrodes each series projected laterally at different planes of inclination into the furnace-chamber from opposite sides thereof with an arcing space between the companion electrodes of a series forming a graded vertically extended and continued smelting and arcing space, means for producing a graduated voltage or temperature for each series of electrodes and a feed or discharge for the material from above into the arcing space, substantially as described.

5. In an electric smelting-furnace, the combination of a furnace-chamber, several superposed series of electrodes projected laterally into the furnace-chamber from opposite sides thereof at different planes of inclination, with an arcing space between the companion electrodes of each series for the superposed arcing space to form a graded vertical downwardly extended and continued smelting and arcing space, means for regulating and graduating the voltage or temperature of each separate series of electrodes, and a feed or delivery spout projected downwardly into the furnace-chamber in juxtaposition to the arcing and smelting space at the commencement thereof and having a central opening for discharge of the material in line with the smelting and arcing space for an initial subjection of the material to the heat as it is discharged and a final subjection of the material in its passage through the arcing space, substantially as described.

6. In an electric smelting-furnace, the combination of a furnace-chamber, several superposed series of electrodes projected laterally into the furnace-chamber from opposite sides thereof at different planes of inclination, with an arcing space between the companion electrodes of each series for the superposed arcing space to form a downwardly vertically extended and continued smelting and arcing space, means for regulating and graduating the voltage or temperature of each separate series of electrodes, and a feed or delivery spout projected downwardly into the furnace-chamber in juxtaposition to the arcing and smelting space and having a central opening for the passage of the material in line with the smelting and arcing space and having a surrounding chamber with inlet and outlet openings for the escape of the evolved gases, for such gases in their escape to impart heat to the delivery or feed spout, substantially as described.

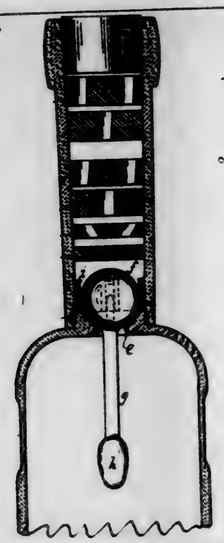
7. In an electric smelting-furnace, the combination of an elongated furnace-chamber, several superposed series of electrodes having the electrodes of each series projected laterally into the furnace-chamber from opposite sides thereof with a downward and inward convergence and with an arcing space between the companion electrodes of each series for the several superposed arcing spaces to form a graded vertically extended and continued arcing space between the superposed series of electrodes, and means for producing different voltages or temperatures throughout the several series of electrodes, substantially as described.

704,994. NON-REFILLABLE BOTTLE. LOUIS C. WEBSTOTH, New York, N. Y. Filed Oct. 19, 1901. Serial No. 79,091. (No model.)

Claim.—1. In a non-refillable bottle, the combination with the bottle-neck having a tortuous outlet or channels and provided at its bottom with a concave valve-seat, of a ball arranged to fit said seat, a weight disposed in the bottle and provided with a stem, the upper end of said stem terminating in outwardly-spreading curved arms that clasp the ball and are firmly attached to the latter, and vertical ribs on the interior of the neck between which the said curved arms are longitudinally movable, substantially as described.

2. In a non-refillable bottle, the combination with the bottle-neck having a tortuous outlet or channels and provided at its bottom with a concave valve-seat, of a ball arranged to fit said seat, a weight disposed in the bottle and provided with a stem, the upper end of said stem terminating in outwardly-spreading curved arms that clasp the ball and are firmly attached to the latter, the said neck being provided with vertical internal ribs between which are disposed the said arms and which act as guides for the ball, the upper ends of the said ribs being contracted or curved inward to limit the movements of the ball, substantially as described.

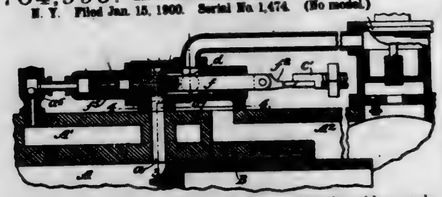
704,994.



angular opening formed by the juncture of the plate and heel of the point to receive a corresponding projection on the landside of the plow whereby to prevent vertical play of the plow-point.

2. The combination, with a plowshare having a notch of special shape in its forward corner and a landside having a projection in its forward edge, of a plow-point having a perfectly flat lower surface provided with a heel adapted to receive the notch of the plowshare and whose triangular notch formed by the juncture of the heel and plate is adapted to receive and fit the projection on the forward edge of the landside, said plow share and point having holes therein and bolts adapted to pass through said holes thereby to secure the plow-point in position and complete the fastening.

704,995. EXPLOSIVE-ENGINE. CARL W. WEBB, New York, N. Y. Filed Jan. 15, 1900. Serial No. 1,474. (No model.)



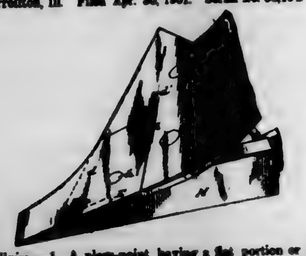
Claim.—1. In an explosive-engine, the combination with an explosion chamber or cylinder having a supply-port and an exhaust-port opened as the piston approaches the limit of its forward stroke, of means to introduce water into the chamber or cylinder as said ports open, whereby the water precedes the explosive charge.

2. In an explosive-engine, the combination with a cylinder having supply and exhaust ports opened by the piston as it approaches the forward limit of its stroke, and means to discharge water through said supply-port as it opens.

3. An explosion-engine having independent air and gas supply ports terminating in the inner surface of the cylinder-wall and means to close said ports at their extremities.

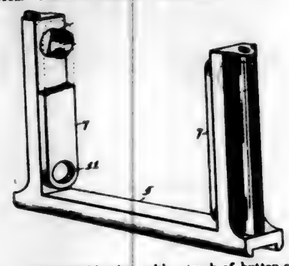
4. An explosive-engine having independent air and gas supply ports terminating separately in the inner surface of the cylinder-wall and uncovered by the piston in its forward movement.

704,996. DETACHABLE PLOW-POINT. CHARLES A. WEBBER, Carrollton, Ill. Filed Apr. 30, 1901. Serial No. 58,194. (No model.)



Claim.—1. A plow-point having a flat portion or plate with the heel forming the only elevation thereon, a plowshare with a special-shaped notch at the forward corner to fit against the heel and plate of the point to prevent lateral or side play, said plow-point also provided with a tri-

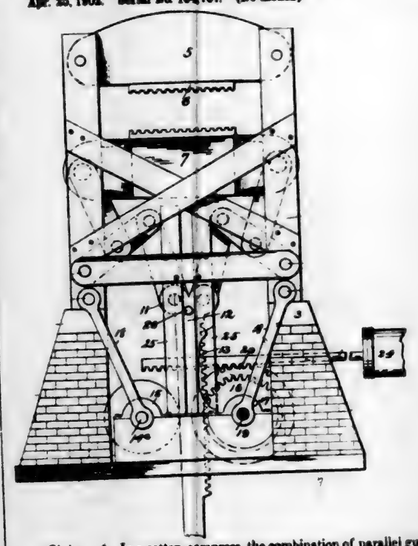
704,997. SWINGING SPRING-SEAT FOR CAR-BOLSTERS. CHARLES T. WHITLAKE, Granite City, Ill., assignor to Commonwealth Steel Company, St. Louis, Mo., a Corporation of New Jersey. Filed May 5, 1902. Serial No. 106,060. (No model.)



Claim.—1. The combination with a truck of button-shaped lugs; links having openings to receive said lugs; and a movable part of the truck connected to the said links, substantially as specified.

2. The combination with truck-columns of button-shaped lugs extending inwardly from near the upper ends of the truck-columns; links having button-openings to receive said lugs; and a spring-seat connected to the lower ends of said links, so as to allow the spring-seat to swing between the truck-columns, substantially as specified.

704,998. COTTON-COMPRESSOR. FRANK L. WHITE, Pine Bluff, Ark., assignor of one-half to William R. Howel, Pine Bluff, Ark. Filed Apr. 25, 1902. Serial No. 104,707. (No model.)



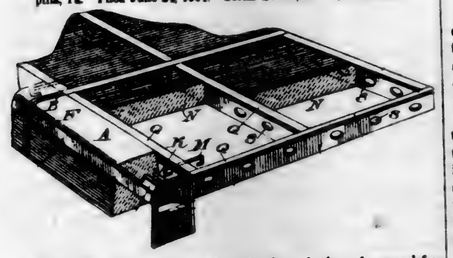
Claim.—1. In a cotton-compress, the combination of parallel guides, a head-block mounted intermediate said guides, a plunger slidingly mounted between said guides, knuckles mounted intermediate said guides, a rack-bar, toggles pivoted to said rack-bar and said knuckles, link-bars pivoted to said plunger and to one member of said toggles intermediate the ends

of said member, a shaft bearing a pinion located to mesh with said rack-bar, a pair of pinions keyed on said shaft, parallel racks meshing with said pair of pinions and connected by a cross-bar, guides for said racks, and a cylinder provided with a piston connected to said cross-bar, substantially as described.

2. In a cotton-compress, the combination of a plunger, a rack-bar, means for connecting said plunger and said rack-bar, a pinion engaging said rack-bar, a roller mounted to bear on said rack to hold it in engagement with said pinion, gears mounted to turn in unison with said pinion, racks engaging said gears, and a cylinder bearing a piston connected to said last-mentioned racks, substantially as described.

3. In a compress, the combination with a base, guides mounted on said base, a plunger slidingly mounted in said guides, a rack-bar, means for connecting said rack-bar and said plunger, a shaft journaled in said base, a roller keyed on said shaft and bearing on the back of said rack, a shaft bearing a gear meshing with said racks, a rack meshing with said gear, means for driving said rack to operate said plunger, diagonal brace-rods connected to the outer ends of said shafts and to said base, substantially as described.

704,999. CURBING AND PAVING. WILLIAM WHITE, Philadelphia, Pa. Filed June 24, 1901. Serial No. 65,747. (No model.)



Claim.—1. In a curbstone, plates for the ends thereof, a guard for the face thereof situated between said plates, and a flange extending therefrom adapted to be embedded in the concrete and having notches for locking the same in position.

2. In a curbstone, plates on the ends thereof, and means situated entirely between said plates for holding the same together.

3. In a curbstone, plates for the ends thereof, a guard supported between said plates whereby the plates of adjacent curbstones can be placed in contact.

4. In a curbstone, plates for the ends thereof, a guard supported between said plates, and means between said plates and engaging therewith for locking the same together.

5. In a curbstone, plates for the ends thereof, anchors on the inner faces of said plates, and tie-rods adapted to engage with said anchors to lock said plates together.

6. In a curbstone, plates for the ends thereof, means on the inner faces of said plates for locking the same together, a guard for the face of said curbstone, and lugs on the inner faces of said plates adapted to support said guard.

7. In a curbstone, a concrete body, plates for the ends thereof, a guard for the face of said curbstone, having notches or recesses engaging with the concrete and locking said guard in position.

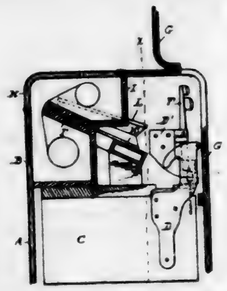
8. In a curbstone, formed of suitable material, plates for the ends thereof, anchors on said plates, rods engaging said anchors to lock said plates together, lugs on said plates, a guard supported by said lugs, and notches in said guard for locking the same in position.

9. The combination of a concrete curbstone and pavement, a plate between the same, and means for locking the curbstone and pavement together with the plate between.

705,000. PIANO-PLAYER. AUGA B. WHITEHEAD, Detroit, Mich., assignor to Farrand & Votey Organ Company, Detroit, Mich., a Corporation of Michigan. Filed May 18, 1901. Serial No. 60,982. (No model.)

Claim.—1. In a piano-player, a vertical case, an action-case arranged in the case below the top, a tracker-board box secured to the top of the action near the middle, a wind-trunk extending up from the action at one side, a horizontal wind-trunk extending across the top of the action behind the tracker-board box and the pneumatic-motor on the action beside the tracker-board box, to which the horizontal trunk connects.

2. In a piano-player, a case, an action arranged in the case below the top, a tracker-board box secured to the top of the action at one side near the middle line of the case, the motor on top of the action at the end of the tracker-board box, leaving the other side of the top of the action clear, and a movable fulcrum-bar having the playing-fingers pivoted thereon, adapted to be moved within the case above the action beside the tracker-board box and motor.



3. In a piano-player, a case, an action arranged in the case below the top, the tracker-board secured to the top of the action, a wind-trunk extending up at one end of the action, and a horizontal wind-trunk extending across the top thereof, a pressure-regulator on the top of the action at one end, connected to said wind-trunk as described, and a pneumatic-motor at the other end of the action, to which said trunk connects.

4. In a piano-player, a case, an action arranged in the case below the top, the tracker-board secured to the top of the action, a wind-trunk extending up at one end of the action and a horizontal wind-trunk extending longitudinally across the same, a regulating-bellows secured to the said trunk at one end, a valve-casing secured to the bellows and connected to the trunk on both sides of the regulating-bellows connection, a valve in said casing and a pneumatic-motor at the other end of the action into which said wind-trunk connects.

5. In a piano-player, the combination of a case, an action in the case, a fulcrum-bar, the playing-fingers pivoted therson, said bar being supported movably to withdraw the fingers in the case or to project them therefrom, of two doors for closing the aperture in the case through which the fingers are projected, one door extending down nearly to the upper face of the projecting portions, for the purpose described.

6. In a piano-player, a fulcrum-bar, having a series of vertical gains in its face, and a series of interposed strips or ribs formed between the gains, of fulcrum-blocks secured to said bar in the gains, other fulcrum-blocks secured on the outer faces of said ribs and projecting beyond the bar, and playing-fingers pivoted in such projections.

7. In a piano-player, a fulcrum-bar having a series of vertical gains in its outer face, and a series of interposed strips or ribs between the gains, of fulcrum-blocks *m* secured to said bar in the gains, other fulcrum-blocks secured on the outer faces of the ribs, the bifurcated portion *n* projecting below the bar and the shoulder *o* on the blocks bearing against the under face of the fulcrum-bar.

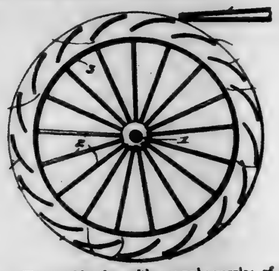
8. In a piano-player, the wind-trunk *k*, the regulating-bellows on one side thereof and the valve-case N on the other side, the wind-trunk K', the ports *a b* connecting the wind-trunks with the bellows, the valve *c* for the port *a*, the ports *h* and *i* connecting the wind-trunks with the valve-case, and the valve O for controlling the by-pass through the valve-case.

9. In a piano-player, a case, an action arranged in the case below the top, a pivoted fulcrum-bar having the playing-fingers pivoted thereon, movable to a position within the case above the action with the playing-fingers in a vertical position at the rear side of the casing, or into a horizontal position projecting without the case.

10. In a piano-player, a case, an action arranged in the case below the top, a movable fulcrum-bar having the playing-fingers pivoted thereon movable within the case to a vertical position above the rear side of the action, and the tracker-board, above the action at the forward side thereof.

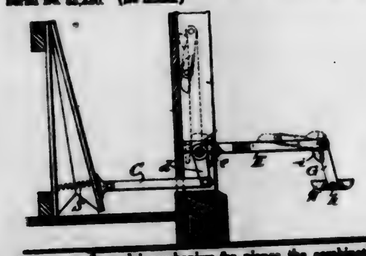
11. In a mechanical playing attachment for keyboard musical instruments, the combination of a casing, a pneumatic-action therein, a series of vertically-movable push-rods operated by said action, a series of finger-levers arranged in their playing position, in a substantially horizontal plane with their key-actuating ends projecting without the casing and their inner ends in proximity respectively to said push-rods, a fulcrum-bar to which said levers are pivoted, and rocking brackets to which said bar is attached arranged laterally in the operating position of parts and adapted to be swung upward to carry said levers into a substantially vertical plane within the casing.

705,001. MOTOR. RALPH WIENER, Eagle, N. Mex. Filed Aug. 22, 1901. Serial No. 72,917. (No model.)



Claim.—The combination with a supply-nozzle; of a motor-wheel having a rim and outwardly-inclined sides forming an annular flaring channel, and arc-shaped vanes having their convex surfaces outermost and extending between the sides and to near the outer edges of said sides and separated from the rim, forming ports or passages for the circulation of the impelling agent between the pockets or spaces formed between the vanes, the curvature of the vanes causing the impelling fluid to be directed toward the rim and from one pocket to another, substantially in the manner specified.

705,002. PEDAL FOR SELF-PLAYING ATTACHMENTS FOR PIANOS. JOSEPH WIENER, Brooklyn, N. Y., assignor of one-half to Karl Fink, New York, N. Y. Filed Dec. 6, 1900. Renewed Nov. 14, 1901. Serial No. 82,220. (No model.)



Claim.—1. In pedal mechanism for pianos, the combination of a set of lever members pivotally connected together whereby they are adapted to be folded, a pedal for said set of members, and means for imparting rigidity to the said set of members when depressing the pedal, substantially as set forth.

2. In pedal mechanism for pianos, the combination of two sets of lever members, arranged side by side, the members of each set being pivotally connected, a pedal for each set of members, and means for imparting rigidity to each set of members, when depressing the pedals, said sets of members being adapted to be separately folded, substantially as set forth.

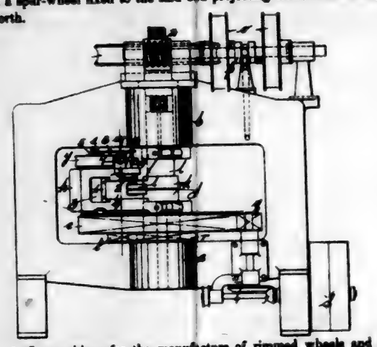
3. In pedal mechanism for pianos, the combination of a set of members, comprising a pivoted lever, and a hanger pivoted to the same, means for imparting rigidity to the set of members, and a pedal pivoted to the hanger, said set of members and pedal being adapted to be folded together, substantially as set forth.

4. In pedal mechanism for pianos, the combination of a crank-shaft, a pivoted lever, hangers pivoted to the lever, a pedal pivoted to the said hangers, said lever, hangers and pedal being adapted to be folded, and means for imparting rigidity to the set of members comprising the lever and hangers, substantially as set forth.

5. In pedal mechanism for self-playing attachments for pianos, the combination, of a crank-shaft, a link for connecting the latter with the bellows, a lever pivoted to said shaft, hangers pivoted to the lever, a pedal pivoted to the hangers, and stop-shoulders on the hangers and lever, substantially as set forth.

705,003. MACHINERY FOR THE MANUFACTURE OF RIMMED WHEELS AND DISKS. EDWARD WILLIAMS, Birmingham, England. Filed Dec. 27, 1901. Serial No. 87,468. (No model.)

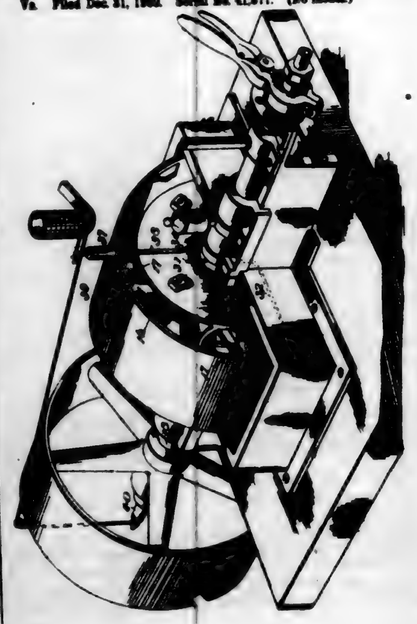
Claim.—1. In machines for the manufacture of rimmed wheels and disks from plain sheet-metal blanks of uniform thickness, the combination consisting of a fixed bed, a holding-down ram, a stem projecting above the said bed, a spur-wheel freely mounted on the said stem and engaging with a rotating pinion, a carrier in rigid attachment with the said spur-wheel, a slide mounted on the said carrier, a rim-forming roll rotatable upon the said slide, and slide-advancing mechanism operated from a spur-wheel fixed to the said bed projecting stem, substantially as set forth.



2. In machines for the manufacture of rimmed wheels and disks from plain sheet-metal blanks of uniform thickness, the combination with a carrier rotatable about the blank fixed to the machine, and a tool-slide mounted on the same carrier, of a cam engaging the outer end of the said slide, a worm-wheel fixed to the spindle of the said cam, a driving-worm mounted upon a spindle provided with a swiveling bearing at one end and a sliding bearing at the opposite end, a withdrawing-spring in attachment with the said sliding bearing, a pivoted step-piece, a step-piece knock-out lever, and a knock-out-lever-operating peg fixed upon and rotating with the said worm-wheel, substantially as set forth.

3. In machines for the manufacture of rimmed wheels and disks from plain sheet-metal blanks of uniform thickness, the combination with rim-forming mechanism rotating around a stem constituting a part of the fixed bed of the machine, of a holding-down ram having a screw-thread cut around its upper portion, a worm-wheel having an internally-threaded center mounted upon the said screwed portion of the ram, a worm engaging the said worm-wheel, a pair of belt-pulleys mounted freely upon the shaft of the said worm, and a clutch arranged between the said pulleys, substantially as set forth.

705,004. ROTARY ENGINE. WM D. WILLIAMS, Fredericksburg, Va. Filed Dec. 31, 1900. Serial No. 41,877. (No model.)



Claim.—1. In a multiple engine, a collar having a passage adapted to communicate with the series of engines, valved pipes in communication with opposite end portions of said passage, and an indicator adapted to be coupled to the upper valved pipe, substantially as specified.

2. In a multiple engine, a collar having two segment-passages adapted to communicate with the series of engines, and provided with two sets of valved pipes, and an indicator adapted to be attached to the collar so as to communicate with either passage thereof, substantially as specified.

3. In a multiple engine having ports, one for each engine, valves controlling the ports, a fixed part having a passage adapted to communicate with the ports of the engines, and an indicator mechanism adapted to be applied to the said fixed parts, substantially as set forth.

705,005. VENDING-MACHINE. ELMER A. WILCOX, Chicago, Ill., assignor, by direct and mesne assignments, to Standard Vending Company, Chicago, Ill., a Corporation of Illinois. Filed Oct. 18, 1901. Serial No. 79,055. (No model.)

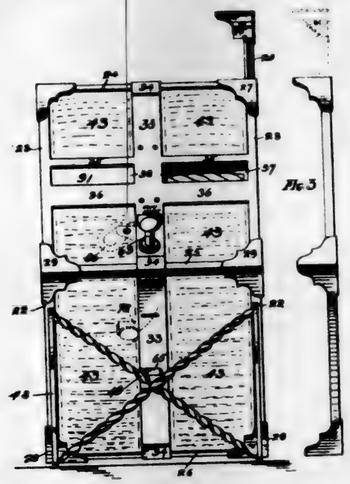


Fig. 3.

Claim.—1 The merchandise-vending machine having two movable pocketed carriers for the merchandise, each with its own delivery window or opening, coin mechanism controlling the movements of the carriers, independent shutters for said openings, and means whereby when one carrier is exhausted, the shutter of the other carrier will be opened, substantially as specified.

2. The merchandise-vending machine having two pocketed carriers for the merchandise movable by the purchaser, and each having its own delivery window or opening, coin mechanism controlling the movements of the carriers, independent shutters for said openings, and means whereby when one carrier is exhausted, the shutter of the other carrier will be opened, substantially as specified.

3. The cigar-vending machine having two movable cigar-holding devices, each with its own delivery-opening, coin mechanism controlling the movements of said devices, shutters for closing said delivery-openings, and means whereby said devices may cause the opening of either shutter, substantially as specified.

4. The cigar-vending machine having a coin mechanism, two movable cigar-holding devices mechanically connected so that they move together and each provided with its own delivery-opening, shutters for closing said openings, and means whereby said devices may, whenever the cigars are all sold from one device, cause the opening of the shutter of the other device, substantially as specified.

5. The coin-controlled cigar-vending machine, having two movable cigar-holding devices each with its own delivery-opening, shutters for closing said delivery-openings, and means whereby said cigar-holding devices may cause the opening of either of said shutters, substantially as specified.

6. The coin-controlled cigar-vending machine having two movable cigar-holding devices each with its own delivery-opening, shutters for closing said delivery-openings, springs for operating said shutters, means for holding the shutters in their closed positions, and means whereby said cigar-holding devices may cause the opening of either of said shutters, substantially as specified.

7. The merchandise-vending machine having two movable pocketed carriers for the merchandise, each with its own delivery window or opening, coin mechanism controlling the movements of the carriers, independent shutters for said openings, means whereby the carriers may cause the opening of either shutter, and means whereby the slot of the coin mechanism will be closed when all the merchandise is sold, substantially as specified.

8. The merchandise-vending machine having two movable pocketed carriers for the merchandise, each with its own delivery window or opening, coin mechanism controlling the movements of the carriers, independent shutters for said openings, and means whereby the slot of the coin mechanism will be closed when all the merchandise is sold, substantially as specified.

9. The vending-machine wherein are combined two rotatable merchandise-carriers, each having its own delivery-window, independent shutters controlling said windows, coin mechanism, and mechanism for controlling said shutters, the coin mechanism and the shutter mechanism being located in a plane between the carriers, substantially as specified.

10. The combination with the merchandise carriers or holders of a coin-controlled vending-machine, of a rotatable toothed wheel or rim 50 supporting said carriers, a surrounding casing having a separate merchandise-delivery window in front of each carrier, separate shutters for closing said windows, mechanism for controlling said shutters, and a cam carried by said rim and causing the operation of said shutter mechanism, substantially as specified.

11. The combination with the merchandise carriers or holders, of a rotatable toothed wheel or rim 50, supporting said carriers, mechanism for operating said rim, a surrounding casing having separate delivery-windows one in front of each carrier, spring-pressed shutters for closing said windows, mechanism for controlling said shutters, and a cam carried by said rim causing the operation of said shutter mechanism, substantially as specified.

12. The combination with the merchandise carriers or holders, of a rotatable toothed wheel or rim 50, supporting said carriers, mechanism embracing the deposited coin for operating said rim, a surrounding casing having a separate delivery-window in front of each carrier, spring-pressed shutters for closing said windows, mechanism for controlling said shutters, and a cam carried by said rim causing the operation of said shutter mechanism, substantially as specified.

13. The combination with the merchandise carriers or holders of a coin-controlled vending-machine, of a rotatable toothed wheel or rim 50, supporting said carriers, a surrounding casing having a window in front of each carrier, shutters for closing said windows, springs for opening said shutters, catches for holding the shutters closed, and a cam carried by said rim and causing the release of said catches, substantially as specified.

14. The combination in a vending-machine, of the shutters for closing the delivery-windows and the gate for closing the coin-slot, all mounted on sliding rods arranged parallel and close together, the rod of the gate having a top cross-bar engaged by the shutter-rods, springs on said rods, catches for holding the shutters closed and the gate open, and means for releasing said catches, substantially as specified.

15. The combination in a vending-machine, of two merchandise-carriers, each having its own delivery-window, coin mechanism for operating the carriers, shutters for said windows and a gate for the slot of the coin mechanism, parallel and adjacent rods supporting said shutters and gate, a controlling device for each rod, and means moving with the carriers for releasing said controlling devices, substantially as specified.

16. The combination in a vending-machine, of two merchandise-carriers, each having its own delivery-window, coin mechanism for operating the carriers, shutters for said windows and a gate for the slot of the coin mechanism, parallel and adjacent rods supporting said shutters and gate, said shutter-rods supporting the gate-rod when they are themselves raised, a catch for each rod, and means moving with the carriers for releasing said catches, substantially as specified.

17. The combination of the delivery-window shutters and their supporting-rods, with the coin-slot gate and the supporting-rod, and the catch by which the gate is controlled and the shutter-rods acting when in their raised positions to prevent the gate from closing, substantially as specified.

18. The combination with the delivery-window shutters and their supporting-rods, with the coin-slot gate, its supporting-rod, the catch by which the descent of the gate is controlled, and the cam releasing the catch, the shutter-rods also acting when in their raised positions to prevent any fall of the gate, substantially as specified.

19. A gate for closing the coin-slot, a spring for the gate, and a catch for holding the gate open, in combination with the shutter for closing the merchandise-delivery window, the catch controlling said shutter, and means for releasing both said catches, the gate-catch being operated in advance of the shutter-catch, whereby the coin-chute will always be closed when the merchandise is sold, substantially as specified.

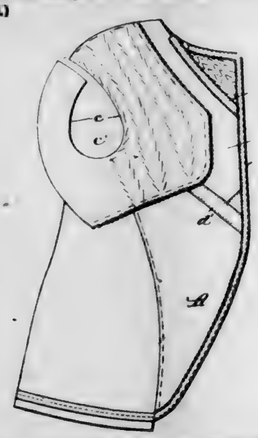
705,006. BINDING-ENVELOP OR FILE. HENRY D. WESTON, Wellesley Hills, Mass. Filed Nov. 22, 1900. Serial No. 737,870. (No model.)

Claim.—1. As an improved article of manufacture, a filing-case or envelop having attached to it at or near its lower edge, a narrow flexible binding-strip running the length of said edge, a section of which extends from said edge and provides the means whereby the envelop or case may be united to others of its kind.

2. A filing-case or envelop having a narrow binding-strip attached to it and running the length of its lower edge, a section of which strip extends from said edge and is covered upon one surface with an adhesive composition, and is adapted to overlap and be attached to the lower edge of another filing-case or envelop.

3. A series of filing-cases or envelops united together by narrow binding-strips secured to the envelops or cases at or near their lower edges and which strips overlap one upon the other, are united one to another by an adhesive composition and form a flexible back for the bound envelops or cases.

705,007. COAT. HARRY WOLF, Chicago, Ill., assignor to R. Kuppenheimer & Co., Chicago, Ill. Filed May 17, 1901. Serial No. 60,686. (No model.)



Claim.—1. A garment of the character described having applied to the body thereof a diagonally-extending piece of elastic cloth cut on the bias and extending from near the shoulder of the garment to the front edge of the garment beneath the lapel, said cloth having horizontally-disposed elastic hairs or strands, and a shoulder-pad applied to the inner side of said elastic cloth adjacent to the armhole of the garment.

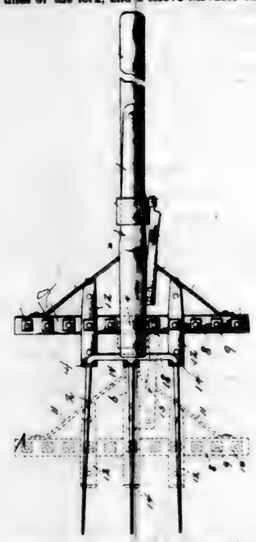
2. A garment of the character described having applied to the breast portion thereof, a lining of dark cloth or the like, a diagonally-extending piece of elastic cloth cut on the bias and extending from near the shoulder of the garment to the front edge of the garment beneath the lapel, said cloth having horizontally-disposed elastic strands and secured to said lining, and a shoulder-pad applied to the inner side of said elastic cloth adjacent to the armhole of the garment.

705,008. COMBINATION RAKE AND FORK. AUGUST ZWICKER, Rusk, Tex. Filed Jan. 31, 1902. Serial No. 92,043. (No model.)

Claim.—1. An implement of the class set forth having a handle with a fork, and a rake attachment having a sliding connection with both the handle and the tines of the fork.

2. An implement of the class set forth comprising a fork having a handle, a rake attachment having slidable connections with both the handle and the tines of the fork, and a locking device carried by the rake attachment to engage a portion of the fork to hold said attachment in operative projected position.

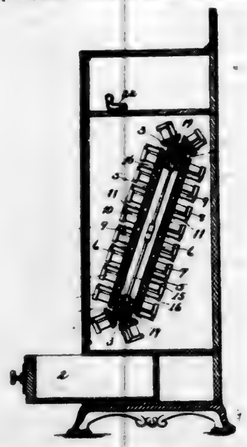
3. An implement of the class set forth comprising a fork having a handle, and a rake attachment having forwardly-projecting guide-clips engaging the tines of the fork, and a sleeve movable on the handle.



4. An implement of the class set forth, comprising a fork having a handle with a diametric reduction in rear of its forward extremity, a rake attachment provided with guide devices engaging the tines of the fork, and a sleeve movable on the handle, and a locking device carried by the attachment for engagment with a portion of the fork to maintain the said attachment in projected operative position.

5. An implement of the class set forth comprising a fork with a handle and a rake attachment having a series of forwardly-projecting guide-clips with upturned ends engaging the tines of the fork, and a sleeve slidably mounted on the handle.

705,009. CABINET FOR GRAPHOPHONES, GRAPHOPHONE-RECORDS, OR THE LIKE. WILLIAM J. MCDEVITT, Philadelphia, Pa. Filed Sept. 13, 1900. Serial No. 29,895. (No model.)



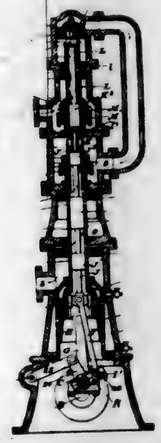
Claim.—1. A cabinet for the purposes described, having arranged therein a plurality of juxtaposed record-holders, each of said holders comprising a support secured at one end and a spring-pressed retainer mounted adjacent to the free end of the support, and means for moving said record-holders so as to bring the desired holder into position for removing or replacing a record.

2. A cabinet for the purposes described, having arranged therein a plurality of juxtaposed movable record-holders, comprising cylindrical supports having exposed or free outer ends, means for locking records on said holders, said means being mounted at one side of and adjacent to said holders, and means for moving said record-holders so as to bring the desired holder into position for removing or replacing a record.

3. A cabinet for the purposes described, having an endless belt adapted to move therein, a plurality of juxtaposed record-holders arranged on said belt, and comprising cylindrical supports having exposed or free outer ends, said means being mounted at one side of and adjacent to said holders, means for locking records on said holders, and means for moving said belt so as to bring the desired holder into position for removing or replacing a record.

REISSUES.

12,009. ENGINE. CHARLES H. BENTON, Cleveland, Ohio. Filed May 5, 1902. Serial No. 105,919. Original No. 667,780, dated Feb. 12, 1901.



Claim.—1. An engine comprising a high-pressure and a low-pressure cylinder arranged in tandem, an independent piston in each cylinder, a pressure-inlet to the high-pressure cylinder, an external passage leading from the exhaust end of the high-pressure cylinder and communicating with the inlet end of the low-pressure cylinder, distribution-valves controlling the high and low pressure cylinders, a crank-shaft and crank, and separate means connecting each piston to said crank.

2. An engine comprising a high-pressure and a low-pressure cylinder arranged in tandem, an independent piston in each cylinder, a pressure-inlet to the high-pressure cylinder, an external passage leading from the exhaust end of the high-pressure cylinder and communicating with the inlet end of the low-pressure cylinder, central-distribution slide-valves controlling the high and low pressure cylinders, a crank-shaft and crank, and separate means connecting each piston to said crank.

3. An engine comprising a high-pressure and a low-pressure cylinder arranged in tandem, an independent piston in each cylinder, a pressure-inlet to the high-pressure cylinder, an external passage leading from the exhaust end of the high-pressure cylinder and communicating with the inlet end of the low-pressure cylinder, central-distribution slide-valves controlling the high and low pressure cylinders, the valve of each cylinder connected to the piston of the other cylinder, a crank-shaft and crank, and separate means connecting each piston to said crank.

4. An engine comprising a high-pressure and a low-pressure cylinder arranged in tandem, an independent piston in each cylinder, a pressure-inlet to the high-pressure cylinder, an external passage leading from the exhaust end of the high-pressure cylinder and communicating with the inlet end of the low-pressure cylinder, central-distribution slide-valves controlling the high and low pressure cylinders, an extension from the piston of each cylinder connected to the valve controlling the other cylinder, a crank-shaft and crank, and separate means connecting each piston to said crank.

5. An engine comprising a high-pressure and a low-pressure cylinder arranged in tandem, an independent piston in each cylinder, a pressure-inlet to the high-pressure cylinder, an external passage leading from the exhaust end of the high-pressure cylinder and communicating with the inlet end of the low-pressure cylinder, central-distribution slide-valves controlling the high and low pressure cylinders, independent valves controlling the inlets to the high and low pressure cylinders, a crank-shaft and crank, and separate means connecting each piston to said crank.

6. An engine comprising a high and a low pressure cylinder arranged in tandem, an independent piston in each cylinder, a steam-chest between the cylinders having a central sleeve with steam-ports, an external passage leading from the exhaust end of the high-pressure cylinder and communicating with the inlet end of the low-pressure cylinder, a central-distribution slide-valve controlling the high-pressure cylinder and arranged within said sleeve, an extension from the piston of the high-pressure cylinder arranged between said valve and sleeve and having ports in position to register with those of said sleeve, a cut-off valve in position to control the ports of said sleeve, a distribution-valve controlling the low-pressure cylinder, a crank-shaft and crank, and separate means connecting each piston to said crank.

7. An engine comprising a high and a low pressure cylinder arranged in tandem, an independent piston in each cylinder, a steam-chest between the cylinders, having a central sleeve with steam-ports, an external passage leading from the exhaust end of the high-pressure cylinder and communicating with the inlet end of the low-pressure cylinder, a central-distribution slide-valve controlling the high-pressure cylinder and arranged within said sleeve, an extension from the piston of the high-pressure cylinder arranged between said valve and sleeve and having ports in position to register with those of said sleeve, a cut-off valve in position to control the ports of said sleeve, a distribution-valve controlling the low-pressure cylinder, a separate valve controlling the inlet to the low-pressure cylinder, a crank-shaft and crank, and separate means connecting each piston to said crank.

8. An engine comprising a high and a low pressure cylinder arranged in tandem, an independent piston in each cylinder, a pair of steam-chests between the cylinders, each having a central sleeve with steam-ports, an external passage leading from the exhaust end of the high-pressure cylinder and communicating with the steam-chest of the low-pressure cylinder, central-distribution slide-valves controlling the high and low pressure cylinders and arranged within said sleeves, an extension from the piston of each cylinder arranged between the distribution-valve and sleeve of the corresponding steam-chest and having ports in position to register with those of said sleeve, separate cut-off valves in position to control the ports of said sleeves, a crank-shaft and crank, and separate means connecting each piston to said crank.

9. An engine comprising a high-pressure and a low-pressure cylinder arranged in tandem, an independent piston in each cylinder, a pressure-inlet to the high-pressure cylinder, an external passage leading from the exhaust end of the high-pressure cylinder and communicating with the inlet end of the low-pressure cylinder, central-distribution slide-valves controlling the high and low pressure cylinders, the valves of each cylinder connected to the piston of the other cylinder, a crank-shaft and crank, and separate means connecting each piston to said crank, arranged to give said pistons and valves a differential motion with respect to each other.

10. A steam-engine comprising a high-pressure and a low-pressure cylinder arranged in tandem, an independent piston in each cylinder, a steam-chest between said cylinders and in open communication with the high-pressure cylinder, whereby a constant steam-pressure is maintained on one face of the piston in the high-pressure cylinder, an air-cushion arranged in position to act as a buffer to the piston of the low-pressure cylinder, a crank-shaft and crank, and separate means connecting each piston to said crank.

11. In a multiple-piston engine, a series of cylinders arranged in axial relation to each other and a series of separate motive pistons of different areas therein arranged in oppositely-driving pairs, a series of distribution-valves connected in pairs and operating centrally as to said pistons and having a rigid connection with one pair of said pistons and an independent sliding contact within the other pair of pistons, substantially as described.

12. In a steam-engine a series of axially-alined cylinders having a set of high-pressure motive pistons and a set of low-pressure motive pistons therein, and a steam-passage from the high-pressure-piston cylinders to the low-pressure-piston cylinders, separate tubes rigidly connecting said pistons in oppositely-driving pairs and having steam inlets and outlets, and valves in pairs arranged to reciprocate within said tubes and control said inlets and outlets and having each pair of said valves connected rigidly with one set of said pistons to move in time therewith and independently of the other set of pistons and valves, substantially as described.

13. In a steam-engine, a series of cylinders and a series of motive pistons of different areas arranged in axial alinement and in pairs and a separate tube connecting each pair of pistons independently of the other pair, said tubes having steam-ducts on each side of each piston, valves in pairs for each pair of pistons connected with and operated by the opposite driving-pistons, and means for operating the pairs of valves having

differently-timed throws to open and close said steam-ducts, substantially as described.

14. In steam-engines of the multiple-piston type, a set of low-pressure motive pistons of different areas and a set of high-pressure pistons of different areas and separate cylinders therefor connected by a steam-passage, separate crank connections with differently-timed throws for said sets, valves centrally as to said pistons and the valves of one set having the same throw as the other set, said valves for the low-pressure pistons having a rigid operative connection with the high-pressure pistons and the valves for the high-pressure pistons having a rigid operative connection with the low-pressure pistons, substantially as described.

15. A steam-engine having a series of cylinders and pistons of different areas arranged in axial alinement and having said pistons connected in pairs to drive in opposite directions, one pair consisting of high-pressure pistons rigidly connected and the other of low-pressure pistons rigidly connected and valves carried by each pair of pistons to operate centrally in the connection of the opposite pair of pistons, and steam-inlets and governing mechanism for each pair of pistons independently of said valves, substantially as described.

16. In a steam-engine, a series of cylinders and pistons of different areas divided into pairs, each pair of pistons having valves connected therewith to operate centrally within the opposite pair of pistons, separate crank connections having differentially-arranged throws for each pair of pistons and valves, ducts to convey the steam from one piston to the other, and separate steam-inlet-governing mechanism for each pair of cylinders and its pistons, substantially as described.

17. A series of steam-cylinders axially arranged and having a set of connected high-pressure pistons and a set of connected low-pressure pistons therein, valves carried by each set of pistons to control the flow of steam between the pistons of the opposite driving set, a duct to lead the steam from one set of pistons to the other set whereby a direct action of the steam is obtained in opposite directions successively, and separate steam-governing mechanism at the inlets of each set of pistons, substantially as described.

18. In an engine as described, a set of cylinders and motive pistons of different areas, the smaller piston located to be subject to constant pressure from the boiler on its under side and the larger piston subject to pressure on its top from steam which has passed the smaller piston, crank connections having differently-timed throws for each piston, and a valve for each piston rigidly connected with and operated by the throw of the opposite moving piston, and separate steam-governing mechanism for said pistons, substantially as described.

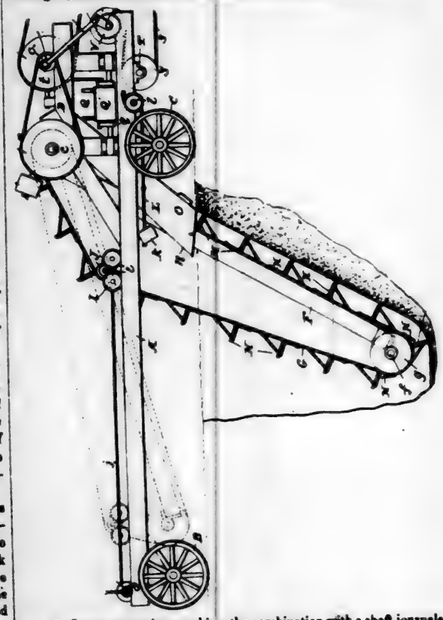
19. In steam-engines, two sets of reciprocating motive pistons and cylinders therefor, one of which sets of pistons has a constant steam-cushion in one direction, and the other set a fluctuating air-cushion in the other direction, substantially as described.

20. In an engine, the axially-alined high-pressure and second expansion cylinders having pistons therein connected by a tube, low-pressure cylinders and the pistons therein, and a supporting-tube for said pistons having crank connections, steam-ducts in said tubes on each side of said pistons, valves on the upper part of the low-pressure-piston tube to control the flow of steam through said ducts about the high-pressure pistons, a tension-rod fixed to said high-pressure pistons having valves to control the flow of steam through the ducts about the low-pressure pistons, separate crank mechanism for said rod timed to work with the low-pressure-piston crank connections, a steam-passage from said second expansion-cylinder and piston to said low-pressure cylinder and pistons, and separate governing mechanism at the steam-inlets of the high and low pressure cylinders and pistons, substantially as described.

12,010. EXCAVATING-MACHINE. HANS J. BERTRAM, Chicago, Ill., assignor to Frederick Howard. Filed Mar. 8, 1902. Serial No. 97,376. Original No. 646,574, dated Apr. 3, 1900.

Claim.—1. In an excavating-machine, the combination with a shaft journaled in bearings on the frame of the machine and carrying parallel sprocket-wheels, of a frame swinging on an axis coincident with the axis of rotation of said shaft and adapted to depend therefrom, a shaft journaled in bearings on the free end of said frame, sprocket-wheels carried by said shaft, parallel sprocket-chains turned over said sprocket-wheels on both said shafts, scraper-plates carried by said chains, and an apron depending loosely from said frame of said machine and adapted to rest at its lower end upon the ground immediately in advance of the ditch, said apron being adapted to prevent the earth carried upwardly by said plates from leaving same at their point of exit from the ditch.

2. In an excavating-machine, the combination with a shaft carrying parallel sprocket-wheels and journaled in bearings upon the frame of the machine of a swinging frame swinging on an axis coincident with the axis of rotation of said shaft, a shaft journaled in bearings on the free end of said frame and carrying parallel sprocket-wheels, parallel sprocket-chains trained over said respective sprocket-wheels, scraper-plates extending between said chains and carried thereby, devices for depressing the free end of said swinging frame, a traveling carriage on the frame of said machine, a shaft carried thereby and provided with sprocket-wheels over which said sprocket-chains are trained, and means for locking said carriage against movement on said frame to hold sprocket-chains taut.



3. In an excavating-machine, the combination with a shaft journaled in bearings on the frame of the machine and carrying parallel sprocket-wheels, of a frame pivotally secured to said shaft and adapted to depend therefrom, a shaft journaled in bearings on the free end of said frame, sprocket-wheels carried by said shaft, parallel sprocket-chains trained over said sprocket-wheels on both said shafts, cutters carried by said sprocket-chains at intervals adapted to loosen the earth, plates alternated with said cutters and adapted to take the loosened earth, a scraper pivotally mounted upon the frame of the machine and adapted to be engaged by said plates to scrape the latter when they approach the upper limits of their motion.

4. In an excavating-machine, the combination with a shaft journaled in bearings on the frame of the machine and carrying parallel sprocket-wheels, of a frame pivotally secured to said shaft and adapted to depend therefrom, a shaft journaled in bearings on the free end of said frame, sprocket-wheels carried by said shaft, parallel sprocket-chains trained over said sprocket-wheels on both said shafts, cutters carried by said sprocket-chains at intervals adapted to loosen the earth, plates alternated with said cutters and adapted to take up the loosened earth, a swinging apron pivotally mounted upon the frame of the machine immediately in front of said sprocket-chains, a receptacle for earth in front of said apron, and a scraper pivotally mounted above said apron and adapted to engage said plates as they approach the upper limit of their movement to scrape the same and deliver the earth into said receptacle.

5. In an excavating-machine, the combination with a shaft journaled in bearings on the frame of the machine and carrying parallel sprocket-wheels, of a frame pivotally secured to said shaft and adapted to depend therefrom, a shaft journaled in bearings on the free end of said frame, sprocket-wheels carried by said shaft, parallel sprocket-chains trained over said sprocket-wheels on both said shafts, cutters carried by said sprocket-chains at intervals adapted to loosen the earth, plates alternated with said cutters and adapted to take up the loosened earth, a swinging apron pivotally mounted upon the frame of the machine immediately in front of said sprocket-chains, a receptacle for earth in front of said apron, conveyers leading from said receptacle, and a scraper pivotally mounted above said apron and adapted to engage said plates as they approach the upper limit of their motion to scrape the same and deliver the earth into said receptacle.

6. In an excavating-machine, the combination with a horizontal frame, drive-gear carried thereby, excavating devices geared to said drive-gear, and a swinging frame carrying said excavating devices and adapted to project above and below said horizontal frame, a windlass on the rear end of said horizontal frame connected with the free end of said swinging frame, a windlass at the forward end of said swinging frame, and a cross-beam connected therewith and adapted to be drawn tightly against the rear face of said swinging frame and the lower face of said horizontal frame, to hold said swinging frame in a lowered position.

7. In an excavating-machine, the combination with a windlass carried thereby and adapted to receive a rope secured at one end to a rigid device in the earth in the direction of motion of the machine, and a ratchet-wheel rigid relatively to said windlass, a lever pivoted concentric with said ratchet-wheel, and a pawl carried by said lever and adapted to engage said wheel, of a drive-shaft, and reciprocating devices actuated from said drive-shaft and connected with said lever for imparting a rocking motion thereto, whereby said machine is gradually advanced.

8. In an excavating-machine, the combination with a windlass carried thereby, and adapted to receive a rope secured at one end to a rigid device in the earth in the direction of motion of the machine, and a ratchet-wheel rigid relatively to said windlass, a lever pivoted concentric with said ratchet-wheel, and a pawl carried by said lever and adapted to engage said wheel, of a drive-shaft, an eccentric carried by said drive-shaft, and an eccentric-rod connected therewith at one end and at its other end with said lever for imparting a rocking motion thereto, whereby said machine is gradually advanced.

9. In an excavating-machine, the combination with excavating devices carried by a moving part of the machine and comprising flat plates extending practically transversely to their direction of motion, of a scraper situated in the path of said plates and adapted to be engaged thereby and forced out of their path, to scrape said plates, said scraper comprising a frame consisting of two parallel side plates pivoted at one end to said machine, a cross-piece mounted between the ends of said side plates and weights carried by the free ends of said side plates.

10. In an excavating-machine, the combination with excavating devices carried by a moving part of the machine and comprising flat plates extending practically transversely to their direction of motion, of a scraper situated in the path of said plates and adapted to be engaged thereby and forced out of their path, to scrape said plates, said scraper being mounted between parallel arms pivoted at one end to a part of the machine and normally held in the path of said plates by means of depressing devices engaging said frame.

11. In an excavating-machine, the combination with the drive-gear, a swinging frame pivotally mounted on same, and sprocket-chains carried by said frame, of excavating devices carried by said sprocket-chains and comprising flat plates extending practically transversely to said chains, plates lying against said chains forward of said first-named plates, and cutters mounted immediately behind each of said first-named plates and projecting beyond the edges of the latter for loosening earth to be taken up by the next succeeding plates.

12. In an excavating-machine, a shovel for receiving and elevating loosened earth and comprising a plate or apron forming an automatic cleaner or scraper and movably attached at a point outside the portion of the shovel which receives and carries the material.

13. A self-dumping elevating-shovel having a movable scraping or cleaning part arranged with one end in the portion of the shovel which carries the material, and attached at a point outside such portion of the shovel, and means for moving such scraping or cleaning part so as to force the material outwardly

14. An elevator comprising a flexible endless belt passing over suitable direction-changing devices, one or more self-cleaning shovels connected therewith, each shovel forming a receptacle connected to the belt, a movable scraping or cleaning part in the soil-carrying portion of the shovel and projecting therefrom, said cleaning part being attached to a section of the belt at a point beyond the soil-carrying part of the shovel and adapted to be moved when passing the direction-changing devices so as to force the material outwardly.

15. In an excavating-machine, an endless belt provided with a series of elevating-shovels each comprising a projecting blade and a plate or apron normally forming a back for the shovel, said plates or aprons thus normally forming backs for the shovels being attached to swing independently of the projecting blades, and means for causing such backs to automatically swing outwardly and upwardly in directions to eject material when the shovels are in position for dumping.

16. In an excavating-machine, a suitable body-frame; an elevator-frame supported to incline downwardly and rearwardly from the body-frame of the machine; an endless belt supported to traverse the elevator-frame; and a series of excavating-shovels arranged upon the endless belt and each comprising a projecting blade, and a swinging plate normally forming a back for the shovel, said plates being independent of the projecting blades.

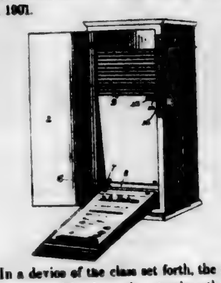
17. In an excavating-machine an endless belt provided with a series of excavating-shovels each comprising a projecting blade and a swinging plate normally forming a back for the shovel, the plates being attached to link-sections of the belt which are jointed to the link-sections to which the projecting blades are attached.

18. In an excavating-machine provided with suitable framework and with a forwardly-inclined endless traveling belt provided with excavating and elevating shovels having swinging backs arranged to automatically swing outwardly when the shovels are right side up and in position to discharge.

19. In an excavating-machine, a swinging frame; sprockets at opposite ends of the swinging frame; endless chains trained over the sprockets; plates projecting outwardly from the endless chains; and plates attached to the endless chains at points between the said outwardly-projecting plates and forming in conjunction with the latter a series of elevating-shovels; the plates thus attached to the endless chains at points between the outwardly-projecting plates being parallel with the portions of the chains to which they are attached when such portions are between the sprockets on the swinging frame, and being arranged to swing outwardly from the sprocket-chains when said portions thereof pass about the upper sprocket on the swinging frame.

20. In an excavating-machine, a swinging frame arranged to incline downwardly and rearwardly; an endless belt trained over direction-changing devices such as sprockets at opposite ends of the swinging frame; and means for elevating the soil comprising a series of plates positioned at intervals upon and projecting outwardly from the endless belt, and plates attached to the endless belt at points between the outwardly-projecting plates and arranged to swing outwardly when passing about the direction-changing devices; the endless belt being constructed with links, and the outwardly-projecting and outwardly-swinging plates being attached to different links.

12,011. INDEX-CABINET. RICHARDSON W. LOCKERBON, Sioux Falls, S. D. Filed Nov. 4, 1901. Serial No. 81,634. Original No. 681,402, dated Aug. 27, 1901.



Claim.—1. In a device of the class set forth, the combination of a cabinet open at the front and having a door to close the same, the upper portion of one end of the cabinet near the one front edge being formed with a vertical slot, and said edge having letters thereon adjacent to said slot, a series of carriers movably attached at their lower ends within the lower portion of the cabinet, the upper end of each carrier, except the one in front, when in superior position, extending above that immediately in advance of it, and a combined index and holder slidingly mounted in the said slot.

2. In a device of the class set forth, the combination of a cabinet open at one side, the upper portion of the one edge of the latter side having letters thereon, a combined index and holder slidingly mounted in one end of the cabinet and having a portion movable over the said letters, and a plurality of carriers movably connected at their lower ends within the lower portion of the cabinet and gradually increasing in length from the front toward the rear one.

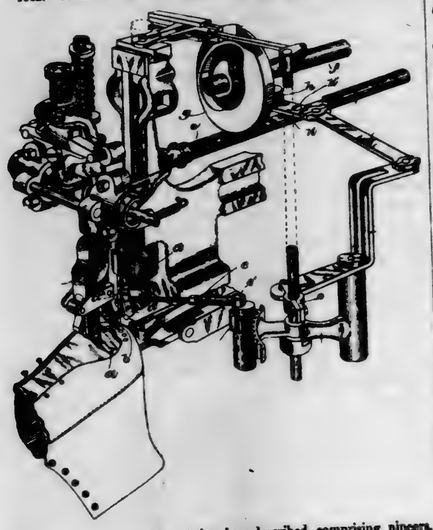
3. In a device of the class set forth, the combination of a cabinet open at one side, a plurality of carriers pivotally mounted therein to move outward and inward through the said open side, the one edge portion of the latter side having a series of letters thereon, the upper end of each carrier, except the one in front, when in superior position, extending above that immediately in advance of it, and a combined index and holder movably mounted in the end of the cabinet adjacent to the said letters.

4. In a device of the class set forth, the combination of a cabinet, a series of carriers, a carrier-holder, and means for supporting said holder in operative position; said carriers being so pivoted in the cabinet as to be inclined when supported by said holder, the upper end of each carrier, except the one in front, when in superior position extending above that immediately in advance of it, and said carrier-holder being movable vertically and adapted to coöperate with the extended ends of the carriers.

5. In a device of the class set forth, the combination of a cabinet

open in front, a series of carriers inclined forward and movably attached at their lower ends within the lower portion of the cabinet, the upper end of each carrier, except the one in front, when in superior position extending above that immediately in advance of it, a holder adapted to move over the upper ends of the carriers to liberate any desired carrier or group of carriers and to support the carriers when the cabinet is closed and an index for the carriers.

12,012. LASTING-MACHINE. MICHAEL F. KELLEY, Brockton, Mass., assignor to the United Shoe Machinery Company, Paterson, N. J., and Boston, Mass., a Corporation of New Jersey. Filed May 22, 1902. Serial No. 108,609. Original No. 693,720, dated Feb. 18, 1902.



Claim.—1. A machine of the class described, comprising pincers, operating mechanism for moving the pincers longitudinally toward and from the inner sole and laterally toward and from the edge of the inner sole, and means for making said operating mechanism partially inoperative to prevent the pincers from grasping the upper.

2. A machine of the character referred to, comprising pincers, operating mechanism for moving the pincers longitudinally toward and from the insole as held by the operator and laterally toward and from the edge of the inner sole, and means for making said operating mechanism partially inoperative to discontinue one of said movements and prevent the pincers from grasping the upper.

3. A machine of the character referred to, comprising pincers, a two-part operating mechanism therefor, one of said parts moving the pincers longitudinally toward and from the insole as held by the operator, and the other to move the pincers laterally toward and from the edge of the insole, and means for making one of said parts inoperative, whereby the pincers are prevented from grasping the upper.

4. A machine of the character referred to, comprising pincers, a two-part operating mechanism therefor, one of said parts moving the pincers longitudinally toward and from the position in which the insole is held by the operator, while the other moves the pincers laterally toward and from the edge of the insole, and means for making the last-mentioned part inoperative to discontinue the lateral movement of the pincers without affecting their longitudinal movement.

5. A machine of the character referred to, comprising pincers reciprocated longitudinally toward and from the work, mechanism for moving the pincers laterally, and means for disconnecting the pincers from said mechanism without affecting the longitudinal movement of the pincers.

6. A machine of the character referred to, comprising pincers, a two-part operating mechanism therefor, one of said parts moving the pincers longitudinally while the other moves the pincers laterally, tacking mechanism organized to supply either longer or shorter tacks at will, and including a tack-feeding controller, and connections between said controller and a member of one of the parts of said operating mechanism, whereby one of the movements of the pincers is discontinued when the controller is operated to supply the shorter tacks, and resumed when the controller is operated to supply the longer tacks.

7. A machine of the character referred to, comprising pincers reciprocated toward and from the work, a reciprocatory shaft for moving said pincers laterally to engage the upper and draw it over on the insole, a rotary cam, a roll carried by said shaft, tacking mechanism including a tack-feed controller, and connections between said roll and controller, whereby the roll is moved into and out of engagement with the cam when said controller is operated.

8. A machine of the character referred to, comprising pincers reciprocated toward and from the work, a reciprocatory shaft for moving said pincers laterally to engage the upper and draw it over on the insole, a rotary cam, a movable lever on said shaft, a roll carried by said lever and movable thereby into and out of the path of the cam, tacking mechanism including a tack-feed controller, and connections between said lever and controller, whereby the roll is moved into and out of engagement with the cam when said controller is operated.

9. A machine of the character referred to, comprising pincers, a shaft c for actuating the pincers, a cam g, a lever A carried by the shaft c and normally parallel therewith, a roll A' movable into and out of the path of the cam g, and means for moving said roll, whereby said pincers may be entirely disconnected from said shaft.

10. A machine of the character referred to, comprising pincers, a shaft c for actuating the pincers, a cam g, a lever A carried by the shaft c and having a roll A' movable into and out of the path of the cam g, and a hand-lever connected to the said lever A for actuating it, whereby said roll may be moved out of the path of said cam to disconnect said pincers from said shaft c.

11. A machine of the class described, comprising pincers, operating mechanism for causing the pincers to pull the upper, tack-supplying mechanism organized to supply tacks of different sizes, and connections between said tack-supplying mechanism and the mechanism for operating the pincers, whereby when the size of tacks supplied is changed the pincers-operating mechanism is rendered partially inoperative to prevent the pincers from pulling the upper.

12. A machine of the character referred to, comprising pincers, operating mechanism for moving said pincers longitudinally and laterally to engage and pull the upper, tacking mechanism organized to supply either longer or shorter tacks at will and including a tack-controller, and connections between said controller and said operating mechanism, whereby one of the described movements of said pincers is discontinued when the controller is operated to supply the shorter tacks.

12,013. LACING-HOOK FOR FLAT LACES. WILLIAM A. KELLY, Mount Hope, Kans. Filed July 17, 1901. Serial No. 68,696. Original No. 667,393, dated Feb. 5, 1901.

Claim.—1. A lacing hook or stud comprising a straight bar recurved at both ends forming guards, and adapted to allow the lace to slide freely over the bar, the guard to the free end overlying the bar and lace, and the guard at the other end being provided with means for attaching the stud to a garment.

2. A lace hook or stud comprising a straight bar sharply recurved at both ends to form guards, leaving a space between each guard and the bar only equal to the thickness of the lace, the guard to the free end overlying the bar, and the guard to the other end being folded under the bar and provided with means for attaching it to the garment.

3. A lace hook or stud comprising a straight flat bar having recurved ends folded one over, one under the bar, the creases at the folds being oblique to the working edge of the bar and parallel to the edge of the lace when in use, whereby the lace is held flat and prevented from becoming frayed or rolled up at the edges.

4. A lacing hook or stud consisting of a piece of material adapted to be attached to a garment, and provided with slots, which have parallel side walls, for the reception of flat lacing, which slots have their entrances for said lacing equal at least to the full width of the slots, said entrances being located at opposite sides of said piece.

5. A lacing hook or stud consisting of a piece of material adapted to be attached to a garment, and provided with slots, which have parallel side walls, for the reception of flat lacing, which slots have their entrances for said lacing equal at least to the full width of the slots, said entrances being located at different sides of said piece.

6. A lacing hook or stud consisting of a piece of material adapted to be attached to a garment, and provided with a slot, which has parallel side walls, for the reception of flat lacing, which slot has its entrance for said lacing equal at least to the full width of the slot, and a guard for retaining the lacing in the slot, which guard is located at the opposite side of said piece from the slot.

7. A lacing hook or stud consisting of a piece of material adapted to be attached to a garment, and provided with a slot, which has parallel side walls, for the reception of flat lacing, which slot has its entrance for said lacing equal at least to the full width of the slot, and a guard for retaining the lacing in the slot, which guard is located at a different side of said piece from the slot.

8. A lacing hook or stud consisting of a piece of material adapted to be attached to a garment, and provided with a slot, which has parallel side walls, for the reception of flat lacing, which slot has its entrance for said lacing equal at least to the full width of the slot, and a guard for retaining the lacing in the slot.

12,014. DOOR-CHECK. CESAR TERRENY, New York, N. Y., assignor, by mesne assignments, to the Noiseless and Draughtless Door and Window Cushion Company, a Corporation of New York. Filed Jan. 21, 1902. Serial No. 90,724. Original No. 693,203, dated July 10, 1900.

Claim.—1. The combination of a door-frame provided with a groove that has different widths in cross-section, a strip adapted to be retained in said groove, said strip comprising a shank that extends into the narrow portion of the groove and one or more shoulders carried by the said shank, which under compression abut against the bottom of the wider portion of the groove, and a facing for said shoulders and a door mounted to abut against said facing.

2. In combination with a rabbet or member for door-frames and like uses, provided with a groove, a strip comprising a compressible or resilient shank adapted to approximately fit the said groove, one or more shoulders provided on the said shank, and a facing of felt or other soft material for the said shoulders, receiving the abutting surface of a door or other coöperating body, for substantially the purposes set forth.

3. The combination of the rabbet of a door or like frame provided with a groove which has different widths in cross-section, a strip adapted to be retained in said groove and comprising a shank which extends into the narrow portion of the groove, one or more shoulders carried by said shank which under pressure abut against the bottom of the wider portion of the groove and a facing of felt or other soft material for said shoulders against which the door abuts, and a door, substantially as described.

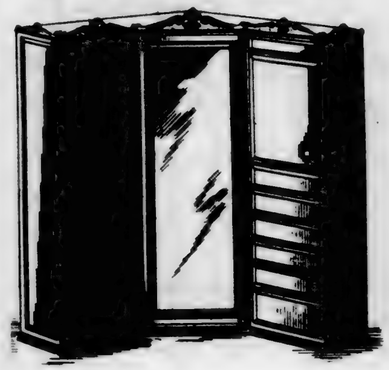
4. In combination with a rabbet or member for door-frames and like uses, provided with a groove, a strip comprising a compressible or resilient shank adapted to approximately fit the said groove, and one or more shoulders provided on said shank in position to normally leave an interval beneath them into which they are adapted to be forced back by an abutting surface, substantially as and for the purposes set forth.

5. The combination of the rabbet for a door-frame or the like provided with a groove which has different widths in cross-section, a strip adapted to be retained within said groove, said strip comprising a shank which extends into the narrower portion of the groove, and one or more shoulders provided on said shank which under pressure abut against the bottom of the wider portion of the groove, and a door, or other movable coöperating body which presses or abuts against said shoulders, for substantially the purposes set forth.

6. The combination with the separable parts of a structure, of a groove in one part having different widths in cross-section, and a compressible strip adapted to be retained in said groove, said strip having a resilient shank which renders the strip as a whole compressible and which extends into the narrower portion of the groove and one or more shoulders provided on said shank which under pressure abut against the bottom of the wider portion of the groove, substantially as described.

DESIGNS.

85,978. DRESSER. CLARA J. CLARKE, Fremont, Ohio. Filed Apr. 23, 1902. Serial No. 104,403. Term of patent 14 years.



Claim.—The ornamental design for a dresser, as herein shown and described.

TRADE-MARKS

REGISTERED JULY 15, 1902.

38,594. SILK PIECE GOODS AND SILK RIBBONS. DREHAN & BYRNE, New York, N. Y. Filed Apr. 18, 1902.

ANTHEREA

The word "ANTHEREA." Used since September 15, 1901.

38,595. WITHDRAWN.

38,596. WITHDRAWN.

38,597. WITHDRAWN.

38,598. FABRICS FOR BOOT AND SHOE LININGS AND TRIMMINGS. FARNSWORTH, HOTT & CO., Boston, Mass. Filed May 20, 1902.

Rushur

The word "RUSHUR." Used since May 1, 1902.

38,599. DRESS-SHIELDS. THE CANFIELD RUBBER CO., Bridgeport, Conn., and New York, N. Y. Filed May 7, 1902.

The representation of a paper seal over or on a bow of ribbon and a dress-shield on the seal. Used since July 1, 1901.

38,600. TROUSERS. ROSENTHAL AND SOLOMON, Trenton, N. J. Filed June 17, 1902.

MAGNATE

The word "MAGNATE." Used since June 14, 1902.

38,601. UNDERSHIRTS. ATHENS KNITTING CO., Athens, N. Y. Filed June 3, 1902.

ARCTIC

The representation of a polar bear and the word "ARCTIC," the bear being represented as standing on all fours. Used since May 1, 1900.

38,602. HOSIERY. PILLING & HADELEY, Philadelphia, Pa. Filed Nov. 26, 1901.

Quaker

The word "QUAKER." Used since February, 1901.

38,603. CORSETS, CORSELETS, CORGETS, BELTS, BUST-HOLDERS, BUSKS, WHALEBONES OR STEELS, AND HOSE-SUPPORTERS. JULES LIEDAHER, Paris, France. Filed May 19, 1902.

The words "A LA PERSEPHONE" and the letters "I C" and the representation of a crowned goddess floating on the clouds and scattering flowers with one hand and holding lilies in the other. Used since 1881.

38,604. HOSE-SUPPORTERS. I. B. KLEINERT RUBBER COMPANY, New York, N. Y. Filed Dec. 16, 1899.

HOOKON

The word "HOOKON." Used since June 1, 1899.

38,605. HOOKS AND EYES. THE VICTOR G. MILLS CO., Wilmington, Del., and Chicago, Ill. Filed Mar. 26, 1902.

A word of the rebus style, comprising the letter "U," a pin, and the word "IT." Used since July 27, 1901.

38,606. CERTAIN NAMED CLOCKS. MYRON W. COLE, St. Paul, Minn. Filed Mar. 31, 1902.

The conventional representation of a bell swung slightly forward upon a horizontal support and having its hammer appearing vertically inside. Used since March 1, 1900.

38,607. CERTAIN NAMED HARDWARE. THE ACME M'F'G CO., Southington, Conn. Filed Dec. 18, 1901.

HURWOOD

The word "HURWOOD." Used since August 20, 1901.

38,608. WRITING-PAPER AND ENVELOPES. HENRY V. WARNER, New York, N. Y. Filed May 20, 1902.

ENVELNOTE

The word "ENVELNOTE." Used since May 1, 1902.

38,609. MEDICINAL PREPARATIONS IN LIQUID AND TABLET FORM FOR CURE OF CERTAIN NAMED DISEASES. THE S. H. WINSTEAD MEDICINE CO., Paducah, Ky. Filed May 19, 1902.

"LaX-Fos"

The likeness of Dr. S. H. Winstead, his facsimile signature, and the hyphenated word "LAX-FOS." Used since July 5, 1900.

38,610. CERTAIN NAMED MEDICAL COMPOUNDS AND PREPARATIONS. FLORENCE S. TUBB BULL, Chelsea, Mich. Filed May 31, 1902.

Vitalene

The word "VITALENE." Used since October 1, 1901.

38,611. BALMS FOR NASAL AND CATARRHAL AFFECTIONS. BROWN MANUFACTURING CO., Greeneville, Tenn. Filed Apr. 18, 1902.

Nosena

The word "NOSENA." Used since January 1, 1902.

38,612. SOOTHING-SYRUP. LOUIS H. MASSON, Montreal, Canada. Filed Mar. 20, 1902.

Dormol

The word "DORMAL." Used since July 5, 1895.

38,613. CHEMICAL PREPARATION FOR REMOVING SUPERFLUOUS HAIR. OTTO ERBERT, Rock Island, Ill. Filed Apr. 23, 1902.

RADIRINE

The word "RADIRINE." Used since January 1, 1902.

38,614. TONICS. H. K. MULFORD Co., Philadelphia, Pa. Filed May 24, 1902.

PROFERRIN

The word "PROFERRIN." Used since December 1, 1901.

38,615. DIURETICS. H. K. MULFORD Co., Philadelphia, Pa. Filed May 24, 1902.

MICTUROL

The word "MICTUROL." Used since December 1, 1901.

38,616. INTESTINAL ASTRINGENTS. H. K. MULFORD Co., Philadelphia, Pa. Filed May 24, 1902.

PROTAN

The word "PROTAN." Used since December 1, 1901.

38,617. SUPPOSITORIES FOR LOCAL TREATMENT OF INTERNAL ORGANS. HENRY R. COOMBS, Hanford, Cal. Filed June 2, 1902.

NON-CONS

The hyphenated word "NON-CONS." Used since December, 1899.

38,618. OINTMENT FOR ACHES AND PAINS. HENRY H. MCCURTAIN, Hammond, Ind. Filed May 26, 1902.

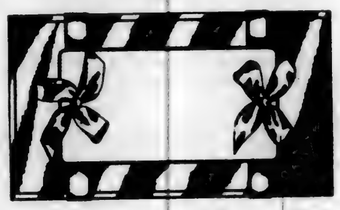
A bust portrait of the registrant and the hyphenated word "MEL-RON." Used since May 6, 1902.

38,619. HORSE REMEDIES. SILAS OMAR PARKER, Littleton, N. H. Filed Jan. 15, 1902.

COMFORT

The word "COMFORT." Used since July, 1900.

38,620. CHOCOLATE CANDY. FRED H. ROBERTS, Boston, Mass. Filed Feb. 28, 1901.



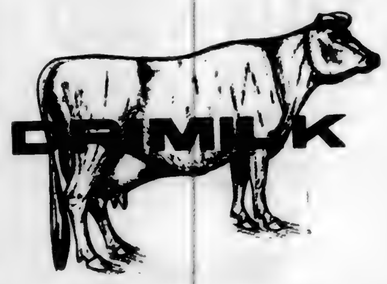
The representation of two ribbons attached to the representation of a card appearing upon a contrasting rectangular background, the ribbons being shown as extending through holes in the card and as formed into bows upon its outer surface. Used since March 6, 1899.

38,621. CONCENTRATED FLAVORING EXTRACT. CORRIGO EXTRACT COMPANY, Albany, N. Y. Filed June 9, 1902.

VANOLEUM

The word "VANOLEUM." Used since May 20, 1902.

38,622. CONDENSED MILK IN POWDERED FORM. CARNES COMPANY OF AMERICA, New York, N. Y. Filed June 13, 1902.



The representation of a cow with the word "DRIMILK" in bold letters across the cow's body. Used since May 26, 1902.

38,623. BAKING-SODA AND BAKING-POWDER. CHURCH & DWIGHT Co., New York, N. Y. Filed June 7, 1902.

The representation of a four-leafed clover. Used since May, 1889.

38,624. WHEAT-FLOUR. HAMILTON R. KEARNY, Minneapolis, Minn. Filed Feb. 24, 1902.

A diamond-shaped figure with the capital letter "K" arranged centrally thereon and with a band printed across the figure bearing the word "POPULAR." Used since November 1, 1901.

38,625. CANNED FANCY SUGAR-CORN. WARFIELD PRATT HOWELL Co., Des Moines, Iowa. Filed June 13, 1902.

The compound word "NORTH-WESTERN" arranged on a panel which overlies a circular field or background. Used since April 1, 1902.

38,626. SALT. DIAMOND CRYSTAL SALT COMPANY, St. Clair, Mich. Filed May 17, 1902.

The Salt
that's all salt

The words "THE SALT THAT'S ALL SALT." Used since May 1, 1895.

38,627. CERTAIN NAMED WASHING COMPOUNDS. NATIONAL SUPPLY Co., New York, N. Y. Filed June 6, 1902.

KOHINOOR

The word "KOHINOOR." Used since May 31, 1902.

38,628. DETERGENT COMPOUNDS USED AS AUXILIARIES TO SOAP. ELIZA WENDT, New York, N. Y. Filed Apr. 8, 1902.

BOILDERO

The word "BOILDERO." Used since February 15, 1902.

38,629. CALCIUM CARBID. ELECTRO LAMP Co., New York, N. Y. Filed Nov. 6, 1901.

Electrolite

The word "ELECTROLITE." Used since December, 1900.

38,630. ILLUMINATING-OILS. GALENA-SIGNAL OIL COMPANY, Franklin, Pa. Filed May 26, 1902.

The pictorial representation of a lantern. Used since 1873.

38,631. LUBRICATING-OILS. GALENA-SIGNAL OIL COMPANY, Franklin, Pa. Filed May 26, 1902.

GALENA

The word "GALENA." Used since December, 1870.

38,632. LUBRICATING-OILS. GALENA-SIGNAL OIL COMPANY, Franklin, Pa. Filed May 26, 1902.

The representation of a star inclosing the letter "G." Used since December, 1870.

38,683. INSULATING MATERIAL. AMERICAN HARD RUBBER CO. New York, N. Y. Filed Apr. 26, 1902.

SAMSOHM

The word "SAMSOHM." Used since April 11, 1902.

38,684. PORTLAND CEMENT. THE TEXAS PORTLAND CEMENT & LIME CO., Galveston, Tex. Filed May 5, 1902.

The words "LIVE OAK" and the representation of a star and surrounding wreath of live-oak leaves tied with a ribbon and interspersed therewith. Used since January, 1901.

38,685. APPLES, APPLE-TREES, SCIONS, CUTTINGS, GRAFTS, ROOTS, AND STOCKS. STARK BRO'S NURSERIES & ORCHARDS CO., Louisiana, Mo. Filed May 22, 1902.

COMMERCE

The word "COMMERCE." Used since November 11, 1895.

38,686. GAS-BURNERS. GEO. BRAY & CO., Leeds, England. Filed May 27, 1902.

LUTA

The word "LUTA." Used since November 15, 1901.

38,687. GAS-ENGINES. THE UNITED STATES GASOLINE ENGINE CO., Chicago, Ill. Filed May 30, 1902.

UNCLE SAM

The words "UNCLE SAM." Used since February, 1902.

38,688. MOWERS, REAPERS, BINDERS, AND PARTS THEREOF. THE JOHNSTON HARVESTER CO., Batavia, N. Y. Filed May 1, 1902.

A shield, a circular wreath arranged centrally on the shield, and a monogram composed of the letters "J H Co" arranged in the center of the wreath. Used since November 1, 1901.

THE NORRIS PETERS CO.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

EX PARTE CUSHING.

Decided March 13, 1902.

DIVISION—PUMP AND MOTOR-GOVERNOR—COMBINATION CLAIMS.

Held that division should not be required between claims for the combination of a specific form of pump for pumping water and air with a closed receptacle and claims for the same combination with the addition thereto of a specific form of motor-governor where the combinations have not acquired a distinct status in the art.

ON petition.

AIR-PRESSURE WATERWORKS AND POWER-REGULATOR.

Application of Charles L. Cushing filed September 3, 1901, No. 74,184.

Mr. A. O. Behel for the applicant.

ALLEN, *Commissioner:*

This is a petition from the action of the Examiner requiring division in the above-entitled application.

Division has been required between claims 1, 2, and 3 for the combination of a specific form of pump for pumping water and air with a closed receptacle and claims 4, 5, and 6, which are stated by the Examiner to cover the same receptacle, but in an entirely different relation—viz., as an element of and holder for a specific type of motor-governor, which governors have acquired a distinct status in the art and are separately classified.

An inspection of claims 4, 5, and 6 shows that they include more than the closed receptacle and the motor-governor—*i. e.*, means for supplying water and air to the receptacle. In other words, claims 4, 5, and 6 cover generally the same combination as claims 1, 2, and 3, with the addition thereto of a specific form of motor-governor. These claims are not, therefore, for a motor-governor alone, but are for a combination of which the motor-governor is one element.

Moreover, it does not appear that the combination covered by claims 1, 2, and 3 and that covered by claims 4, 5, and 6 are inventions which have acquired a distinct status in the art or in manufacture and sale. Division, therefore, should not be required.

The petition is granted.

EX PARTE COWPER-COLES.

Decided March 14, 1902.

DIVISION—PROCESS AND PRODUCT.

Held that division should not be required between claims to a process of depositing zinc on metallic surfaces and claims to the article produced where there is doubt as to the possibility of producing the article by any other process and the process will not produce any other article.

ON petition.

DEPOSITION OF METALS OR COMPOUNDS.

Application of Sherard Cowper-Coles filed July 24, 1901, No. 69,587.

Messrs. A. C. Fraser & Co. for the applicant.

ALLEN, *Commissioner:*

This is a petition that the Examiner be instructed to withdraw his requirement for division between the claims of the above-entitled application and that he be further instructed upon certain matters relating to the question of division generally.

Division has been required between claims 1 to 8, inclusive, covering a process of depositing zinc on metallic surfaces, and claim 9, which covers a product of this process—*i. e.*, a metallic object with its surface covered with zinc, said surface having certain specified characteristics. The Examiner bases his requirement upon the fact that when two of these characteristics only are considered the product may obviously be made by other processes—as, for example, by electrodeposition—and states that the two other features of difference are regarded "as devoid of significance other than as surplusage."

From this statement of the case it is evident that there is doubt as to the possibility of producing the product covered by claim 9 by any other process than that covered by the other claims, while it is very clear that the method will not produce any other product.

Under these circumstances division should not be insisted upon, and the Examiner is directed to withdraw his requirement.

To the extent indicated the petition is granted.

EX PARTE SCOTT.

Decided June 9, 1902.

1. EXAMINATION—PRACTICE—AMENDMENT NOT ENTERED.

Where the Examiner rejects the claims and in reply the applicant requests reconsideration and presents an argument responsive to the Examiner's action and at the same time presents as an amendment a new claim drawn to a different invention, *Held* that the amendment should not be entered, but that the Examiner should act upon the claims already in the case in view of the argument presented.

2. ABANDONMENT OF APPLICATION—RESPONSIVE ACTION.

Where within the time required by law an applicant takes an action which is completely responsive to the Examiner's action, *Held* that the case cannot properly be held to be abandoned.

ON petition.

ADJUSTABLE PULLEYS.

Application of Walter Scott filed March 26, 1901, No. 52,875.

Mr. Richard W. Barkley for the applicant.

ALLEN, *Commissioner.*

This is a petition from the action of the Primary Examiner refusing to enter an amendment filed April 15, 1902, and holding that the application is abandoned.

The three claims originally presented in this case were rejected by the Examiner on April 20, 1901, and on April 15, 1902, the applicant filed a request for reconsideration accompanied by an argument pointing out his reasons for regarding the claims as patentable over the references. This action was proper and was all that could be required of the applicant under the settled practice of the Office. Accompanying his argument, however, was an amendment making certain changes in the description, inserting a new claim, and adding a new figure to the drawings. The Examiner regarded the new claim as covering a different invention from that originally claimed and refused to admit it upon the ground that its entry would immediately necessitate a requirement for division. This was in accordance with the settled practice of the Office; but the Examiner in addition refused to give any action upon the merits of the case and held it abandoned through a lack of proper prosecution.

The applicant has done everything that could be required of him, and he should not be deprived of all consideration merely because he went further and presented an inadmissible amendment. That amendment, whether admitted or not, could not affect in any way the action which would be taken upon the claims already in the case, and there seems to be no good reason why the Examiner should not have given an action upon those claims, as requested, at the same time that he refused to enter the new claim. This case is different from one where an amendment is presented parts of which are admissible and parts inadmissible and where the action given necessarily depends upon the question whether the amendment is entered. In the present case the request for reconsideration and the amendment are separable things, which must receive independent action.

It is held that the argument filed on April 15, 1902, was sufficient to save the case from abandonment and that in response to it the Examiner should act upon the merits of the claims in the application.

An examination of the new claim presented shows that it is limited to a printing-press and covers a certain combination of parts in such a press. The other claims in the case are for an adjustable pulley, which is an independent invention from printing-presses. The adjustable pulley claimed in this case was upon the requirement of the Office divided out of a companion application claiming a printing-press. The Examiner was right in taking the position that this application should be limited to the pulley.

The new figure of the drawings which has been filed seems to be unnecessary and it is doubtful if it can properly be admitted, although the Examiner does not appear to have raised that question.

To the extent indicated the petition is granted.

EX PARTE WEST.

Decided June 20, 1902.

1. TRADE-MARK—THE WORD "BESTOFALL" NOT REGISTRABLE.

The word "Bestofall" not registrable as a trade-mark, as it indicates the quality of the goods in that they are the best of all in that class.

2. SAME—THE SINGLE WORD "BESTOFALL" NOT DIFFERENT FROM THE THREE WORDS "BEST OF ALL."

The single word "Bestofall" conveys the same idea as the three words "best of all." It cannot, therefore, in any true sense be said to be a coined word.

ON appeal.

TRADE-MARK FOR BAKERY PRODUCTS, ETC.

Application of Erik West filed April 9, 1902, No. 65,533.

Mr. Erik West pro se.

ALLEN, *Commissioner:*

This is an appeal from the refusal of the Examiner of Trade-Marks to register the word "Bestofall" as a trade-mark for bakery products.

The word "Bestofall" is descriptive of the quality or characteristic of the article to which it is applied. It is descriptive in that it indicates that the article to which it is applied is the best of all in that class. If this is not true, the word is deceptive. Either of these reasons constitutes a sufficient ground for the refusal of registration.

In *ex parte Miller* (95 O. G., 1452) the word "Fitmeeasy" was held to be—

> * * * descriptive and that it is not rendered the less so by the fact that it is made up of three words. It cannot in any true sense be said to constitute a coined or arbitrary word when it conveys the same idea whether read or pronounced as would the three words written separately. A mere change in the manner of writing the mark cannot be held to change its character so long as the impression conveyed by it is the same.

This reason is equally applicable to the word "Bestofall."

The decision of the Examiner of Trade-Marks is affirmed.

EX PARTE SWAN AND FINCH COMPANY.

Decided June 20, 1902.

TRADE-MARK—A "RED STAR REPRESENTED BY A WORD OR SYMBOL" NOT REGISTRABLE OVER A "STAR INCLOSING THE LETTER 'G.'"

A trade-mark consisting of a "red star represented by a word or symbol" *Held* not to be registrable in view of the registered mark which consists of a "star inclosing the letter 'G'" on the ground that there is such a resemblance between the two marks that the purchasing public would be deceived.

ON appeal.

TRADE-MARK FOR LUBRICATING-OILS.

Application filed November 22, 1900, No. 62,165.

Mr. E. G. Siggers for the applicant.

ALLEN, *Commissioner:*

This is an appeal from the action of the Examiner refusing to register as a trade-mark for engine-oil a mark described as a red star represented by word or symbol. The facsimile shows only the symbol.

Registration has been refused in view of the prior registration, No. 23,966, to the Galena Oil Works of a star inclosing the letter "G." In this registration it is stated that the letter "G" may be omitted. The registered mark may therefore consist of the representation of a star. It is clear that there is such a resemblance between the two marks that the purchasing public would be deceived. Registration, therefore, was properly refused.

The action of the Examiner of Trade-Marks is affirmed.

EX PARTE CASTLE BROOK CARBON BLACK COMPANY.

Decided June 30, 1902.

TRADE-MARK—THE WORD "NAPTHOL-METHANE" REGISTRABLE FOR CARBON-BLACK.

The compound word "Napthol-Methane" *Held* to be registrable as a trade-mark for carbon-black, for the reason that it is well known that this substance contains nothing but carbon. If these words are descriptive at all, they are not descriptive of this substance; neither are they deceptive, as they would never be understood as describing carbon-black.

ON appeal.

TRADE-MARK FOR CARBON-BLACK.

Application filed January 31, 1902, No. 64,980.

Mr. E. G. Siggers for the applicant.

ALLEN, *Commissioner:*

This is an appeal from an action of the Examiner of Trade-Marks refusing to register the word "Napthol-Methane" as a trade-mark for carbon-black.

This word is manifestly a compound of the two words "naphthol" and "methane," and registration has been refused because, in the opinion of the Examiner, it is either descriptive of the character or composition of the substance in connection with which it is used as stating that this substance contains naphthol and methane, or it is deceptive if the substance does not contain these elements.

It is to be observed that the trade-mark for which registration is sought is applied to carbon-black, which, as is well known, contains nothing but carbon. It is clear, therefore, that a substance containing naphthol and methane could not be carbon-black, and the word "Napthol-Methane" would never be understood as describing carbon-black. If they are descriptive at all, they are not descriptive of this substance.

Furthermore, it is believed that one wishing to purchase carbon-black would not be deceived by this trade-mark and suppose that the carbon-black contains naphthol and methane.

This mark is therefore registrable, and the action of the Examiner of Trade-Marks is reversed.

STORY *v.* CRISWELL.

Decided June 26, 1902.

1. INTERFERENCE—DISSOLUTION—RIGHT TO MAKE CLAIMS—APPEAL TO COMMISSIONER DIRECT DISMISSED.

Where the Examiner dissolves an interference on the ground that the respective parties thereto have no right to make the claims, no appeal from such a decision can be taken directly to the Commissioner, and such an appeal will be dismissed.

2. SAME—SAME—APPEAL—MOOT QUESTION.

Where the Examiner dissolves an interference because the parties thereto have no right to make the claims on the ground of inoperativeness and the limit of appeal from said decision having expired, *Held* that the question of interference in fact necessarily becomes a moot question, and an appeal from a decision involving the same will be dismissed.

APPEAL on motion.

MACHINE FOR MAKING MATCHES.

Application of Ward B. Story filed July 5, 1900, No. 22,515. Applications of James A. E. Criswell filed, respectively, March 20, 1901, and November 16, 1899, Nos. 52,005 and 737,186.

Mr. Edwin H. Brown for Story.

Mr. James A. E. Criswell pro se.

ALLEN, *Commissioner:*

This case comes up on appeals by both parties from a decision of the Primary Examiner upon a motion by Criswell to dissolve.

Criswell's motion was based upon the grounds:

1. That there has been such irregularity in declaring the interference as will preclude a proper determination of the question of priority.
2. That Story has no right to make the claims involved in the interference.
3. That Story has no right to make certain of the claims involved in the interference for the reason that his device is inoperative and incapable of performing any useful function.
4. Because no interference in fact exists between the applications involved in this interference.

The motion was denied as to counts 1, 3, 4, 7, and 8 of the issue and was granted as to counts 2, 5, and 6.

It appears that the existence of an interference in fact between the application, so far as counts 1, 3, 4, 7, and 8 are concerned, is not seriously questioned by Criswell; but he contends that there has been irregularity in the declaration because, in his opinion, Story's application does not disclose an operative device. The Examiner has found that Story does disclose an operative device. This is a matter which relates to Story's right to make the claims in issue, and no appeal lies from the Examiner's favorable holding thereon. In any case there is no direct appeal to the Commissioner upon such a question. Criswell's appeal is therefore dismissed.

Story appeals from the Examiner's decision dissolving the interference as to counts 2, 5, and 6.

The Examiner has granted Criswell's motion as to those counts upon all the grounds upon which that motion was based. He has dissolved it, therefore, because Story has no right to make the claims comprising these counts of the issue. From the decision on this ground appeal lies to the Examiners-in-Chief and not to the Commissioner. No such appeal has been taken, however, and the Examiner's decision on this ground has become final. The questions of interference in fact and irregularity, therefore, so far as these counts are concerned, are moot questions, which it is unnecessary now to decide.

Story's appeal is also dismissed.

ROBINSON *v.* TOWNSEND *v.* COPELAND.

Decided June 27, 1902.

1. INTERFERENCE—MOTION TO REOPEN—DILIGENCE IN FINDING NEW FACTS—WHAT CONSTITUTES.

Where a motion is brought to reopen an interference proceeding and take additional testimony and the facts in sup-

port of said motion are that a certain letter which is thought to be material to the case is subsequently found in an envelop placed among other papers, which papers were searched prior to and during the taking of the testimony, and the only reason for not primarily finding the said letter was that because of an indorsement on the envelop containing the same the contents of the envelop were not looked into, *Held* not to constitute sufficient ground for granting the motion.

2. SAME—SAME—REQUISITES OF.

Where a motion to reopen an interference to take further testimony does not set forth the facts to which the proposed witnesses will testify, *Held* that the motion will not be granted.

APPEAL on motion.

VEHICLE BRAKE AND COASTER.

Application of William Robinson filed September 18, 1899, No. 730,817. Application of H. P. Townsend filed October 10, 1898, No. 693,117. Application of James S. Copeland filed April 29, 1898, No. 679,185.

Mr. William Robinson pro se.

Messrs. Newell & Jennings and *Mr. T. Hart Anderson* for Townsend.

Messrs. Jenkins & Barker for Copeland.

ALLEN, *Commissioner:*

This is an appeal by Townsend from the decision of the Examiner of Interferences denying his motion to reopen this case and take additional testimony.

The showing in support of this motion consists of two affidavits, one by Albert F. Rockwell, secretary and general manager of The New Departure Manufacturing Company, of Bristol, Conn., the assignee of Townsend, and the other by T. H. Anderson, the attorney of record for Townsend.

It appears that the motion was brought because of the discovery of a certain letter which was inclosed in an envelop placed among other papers in the vaults of The New Departure Manufacturing Company. This letter is thought to be material to Townsend's case. It is desired to take the testimony of several enumerated witnesses with respect to the alleged disclosure of the invention by Townsend to Copeland and others of the Pope Manufacturing Company, the assignee of Copeland.

It is admitted by Rockwell that the vaults of his company had already been searched for evidence relating to this interference prior to and during the taking of the testimony. The envelop which contained the letter in question was found at that time; but because it had a certain indorsement placed upon it the contents of the envelop were allowed to remain undisturbed, and consequently the letter therein was not then discovered. In view of these facts Townsend cannot be held to have been sufficiently diligent in making his original search. The letter was in his possession all the time. The only reason that he did not find it was that he did not happen to look in the envelop in which it was inclosed when the envelop was before him.

As stated by the Examiner of Interferences, "there is no setting forth of facts to which the witnesses will testify."

The reasons set forth do not warrant the reopening of this case. (*Schmiedl* v. *Booth*, 57 O. G., 695; *Edison* v. *Maxim* v. *Swan*, 57 O. G., 696; *Sutter* v. *McDonnell* v. *Jolly* v. *Neff*, 98 O. G., 1484.)

The decision of the Examiner of Interferences is affirmed.

EX PARTE ASPEGREN AND COMPANY.

Decided June 28, 1902.

1. TRADE-MARK—THE WORD "AURORA" REGISTRABLE.

The word "Aurora" *Held* to be registrable as a trade-mark, as its fanciful or arbitrary meaning so predominates over its purely geographical significance that it would be understood by the purchasing public as an arbitrary word designating origin or ownership.

2. SAME—ARBITRARY WORDS—NAME OF LOCALITY.

Where a word having an arbitrary or fanciful meaning has been adopted as a name of locality, *Held* that the question whether or not it is registrable as a trade-mark depends upon the question whether or not its arbitrary meaning so far predominates over its geographical meaning that it will be so understood by the purchasing public.

3. SAME—REGISTRABLE MARKS—INDICATION OF ORIGIN OR OWNERSHIP.

Whether or not a word is registrable as a trade-mark depends upon the meaning which will be given to it by the purchasing public. If it will be understood as indicating origin or ownership, it is registrable.

ON appeal.

TRADE-MARK FOR PRODUCTS.

Application filed June 7, 1901, No. 63,534.

Messrs. Munn & Co. for the applicant.

ALLEN, *Commissioner:*

This is an appeal from the action of the Examiner of Trade-Marks refusing to register the word "Aurora" as a trade-mark for oils, lard, syrup, and honey.

It appears that this word is extensively used in this country in a geographical sense as the name of several cities and towns and of one county. The most important of these places is Aurora, Ill., a manufacturing city of some prominence. These cities and towns appear in the various States throughout the country from Maine to Oregon. This geographical meaning of the word, therefore, is in this country well understood.

On the other hand, it has mythological and other arbitrary meanings, as well known. In mythology it is the goddess of morning, or daybreak, and hence "Aurora" signifies the rising light of morning—the dawn of day. The phenomenon called the "aurora borealis" is commonly referred to as "the aurora."

The question presented, therefore, in view of these various significations is whether this word would be accepted by purchasers of the goods to which it is applied as arbitrary and fanciful or would be given its geographical meaning.

It was stated by the Supreme Court of the United States in *Columbia Mill Company* v. *Alcorn et al.* (65 O. G., 1916) that—

> * * * merely geographical names cannot be appropriated and made the subject of an exclusive property. They do not, in and of themselves, indicate anything in the nature of origin, manufacture, or ownership.

There is, however, as was pointed out in *ex parte Manogue-Pidgeon Iron Company*, (97 O. G., 2084,) in addition to those words, which have no other significance than a geographical one, a large class

of words which, though used to designate some town or locality, have also an arbitrary or fanciful meaning. The word "Aurora" is of this latter class.

Whether or not these words are registrable as trade-marks depends upon the meaning which will be given to them by the purchasing public. In some cases the arbitrary meaning would be accepted, and in such cases these words will truly indicate origin or ownership. (*Ex parte Manogue-Pidgeon Iron Company, supra; ex parte Huenefeld*, 98 O. G., 1968.) In other cases the geographical meaning is so well known as to be predominating. In this class of cases the geographical significance naturally follows from such use and they would not be understood in an arbitrary or fanciful sense.

The fanciful meaning of the word "Aurora" has undoubtedly led to its adoption as a name of locality in various parts of the country, and the fact that it has been so adopted in widely-separated places is evidence of the general understanding of this fanciful meaning and that this meaning is so pleasing to many persons as to suggest to them that the word is suitable as a designation of that locality in which they dwell. It is true that by this use the word has acquired a geographical significance of considerable extent; but it cannot be said that this geographical significance has divested it in any degree of its mythological or arbitrary meaning. On the contrary, this meaning is understood by a large part of the persons to whom its geographical significance is best known, while by a majority of the people in this country it is understood only in its arbitrary sense. The number of people, therefore, to whom it would be known only as a name of locality is necessarily small.

Taking all the facts into consideration, it cannot be said that this is one of those words in which the geographical meaning predominates. On the contrary, its arbitrary meaning is so prominent that it would be understood by the purchasing public as an arbitrary word designating origin or ownership, and this conclusion is rendered more certain by the fact that applicants' business is not located in any place called Aurora, but in New York city.

The decision of the Examiner of Trade-Marks that the word "Aurora" is unregistrable because geographical in meaning is reversed.

SEAMAN *v.* BROOKS.

Decided June 28, 1902.

1. INTERFERENCE—PRELIMINARY STATEMENT—PARTIAL DISSOLUTION—NEW STATEMENTS NOT PERMITTED.

Where preliminary statements have been filed in an interference proceeding and on motion the interference is subsequently dissolved as to one of the counts and continued as to others, this fact of itself does not warrant new times for filing preliminary statements being set, as such a proceeding would have the effect of permitting the amendment of the original statement.

2. SAME—SAME—MOTION TO FILE NEW STATEMENT—SHOWING REQUIRED.

Where the showing which accompanies a motion to file a new preliminary statement, which is in effect a motion to amend the original statement, merely states that additional facts have been discovered, without specifying said facts, and that the utmost diligence was exercised in making the discovery of the new facts, without stating what means were employed and the reasons why the same means could not have been earlier employed, *Held* not sufficient to warrant the grant of the motion. (*McDermott* v. *Hildreth*, 98 O. G., 1282.)

APPEAL on motion.

GARBAGE OR REFUSE CAN.

Application of Elizabeth C. Seaman filed February 19, 1901, No. 47,926. Patent granted James Brooks February 5, 1901, No. 667,422.

Messrs. Kenneson, Crain, Emley & Rubino, and *Mr. George E. Morse* for Seaman.

Mr. R. C. Mitchell for Brooks.

ALLEN, *Commissioner:*

This is an appeal by Seaman from the decision of the Examiner of Interferences denying her motion to set times for filing new preliminary statements.

The issue of the above-entitled interference as originally declared contained three counts.

After the preliminary statements had been received and approved a motion for dissolution was brought by Seaman, which motion was granted by the Examiner as to count 1 and denied as to counts 2 and 3. The Examiner of Interferences subsequently dissolved the interference as to count 1 and resumed proceedings as to counts 2 and 3 and reset times for taking testimony. Seaman thereupon filed the present motion that new times be set for filing preliminary statements. An affidavit of George E. Morse, one of the counsel for Seaman, accompanies said motion.

When the preliminary statements now on file were prepared, they were drawn up in view of the same two counts which comprise the present issue. The fact that the interference has been dissolved as to one of its original counts and resumed as to the remaining counts is no reason of itself for setting new times for filing preliminary statements, for the dissolution does not in any way affect the remaining counts. To set new times for filing preliminary statements would have the effect of permitting the amendment of the original statements.

In the decision of *McDermott* v. *Hildreth* (98 O. G., 1282) it was said that when—

> * * * one who has made a *bona fide* mistake in the preparation of his statement not due to his own negligence moves promptly to amend before testimony has been taken, if no additional burden or expense will be thrown upon the opposing party the amendment upon a proper showing of facts may be admitted. (*May* v. *Merker*, 85 O. G., 150.)

This rule was made on the broad ground that it is the duty of this Office to issue a patent to the applicant entitled thereto, and it is essential that the facts should be before the Office in order that it may be able to perform this duty.

In the present case it does not appear that the appellant has committed a *bona fide* mistake in the preparation of the original preliminary statement. The affidavit merely states that additional facts have been discovered by Seaman since the filing of the original statment which entitle her to allege an earlier date of invention and that these additional facts—

could not have been by the utmost diligence sooner discovered, and have now been brought forward with the utmost diligence.

It is not stated what the additional facts are; nor is it stated that the utmost diligence was exercised in making the discovery of the new and additional facts. The affidavit does not state the ways and means employed in finding the new facts; neither does it point out why the same ways and means could not have been earlier employed.

The showing is not sufficient to warrant the grant of this motion.

The decision of the Examiner of Interferences is affirmed.

EX PARTE TYLER.

Decided July 2, 1902.

1. DIVISION—GAS-ENGINE.

Held that division was properly required between claims to a sparking igniter, claims to a governor-valve, claims to a relief-valve, and claims to the general structure of a gas-engine. They cover separate and independent inventions.

2. SAME—SAME—PARTS SPECIALLY ADAPTED FOR USE TOGETHER.

Held that division should not be insisted upon between claims to the engine bed or frame and to the valve-gear and claims to the general engine structure where the combinations are specially adapted for use in the general engine structure.

ON petition.

GAS-ENGINES.

Application of Aaron J. Tyler filed May 1, 1900, No. 15,098.

Mr. Tyler pro se.

ALLEN, *Commissioner:*

This is a petition from the action of the Examiner requiring division between certain claims in the above-entitled application on the ground that they cover, respectively, independent inventions capable of separate use.

The invention relates to a gas-engine of special type. It is rightly held by the Examiner that claims 6, 7, 8, and 9 cover the general organization of the gas-engine.

The Examiner has required claim 1 to be divided from the remaining claims on the ground that it covers specifically the engine bed or frame. This claim does not cover an independent invention in the sense that it should be presented in a separate application from that containing the claim to the general gas-engine structure.

The same is true of the invention covered by claims 4, 11, and 12, which the Examiner has held should be divided from the remaining claims on the ground that they cover an engine valve-gear. These claims cover a valve-gear; but the combination covered by them is specially adapted for use in the general engine structure invented by the petitioner and may therefore be prosecuted in the same application with claims 1, 6, 7, 8, and 9.

Claims 2 and 3 cover a sparking igniter, claim 5 covers a governor-valve, and claim 11 covers a relief-valve. Each of these inventions is separate and independent from the special engine construction invented by the petitioner. They are recognized as separate and independent inventions by inventors and manufacturers, and they are separately sold and used. This Office has also recognized the fact that these inventions are separate and independent from each other in its scheme of classification. The requirement of division as to claims 2, 3, 5, and 11 is a proper one.

The petition is granted to the extent indicated.

Patents Nos. 705,010 to 705,547.

Patent and Trade-Mark Registration in Cuba.

[Translation.]

LEGATION OF CUBA,
Washington, D. C., July 5, 1902.

EXCELLENCY: In pursuance of instructions from my government, I have the honor to transmit to Your Excellency the communication addressed to the Department of State by the Department of Agriculture, Commerce and Industry under date of June 21 last, as follows:

SIR: I have, on this day, directed the announcement of the following decision. The military government of the United States in this Island having come to an end, and the circulars Nos. 12 and 21, respectively dated April 11 and June 1, 1899, issued by the Division of Customs and Insular Affairs of the War Department of Washington in respect to the registration of American trade-marks and patents having in consequence become void and null, by virtue of their text itself, since those circulars were issued for the territories subject to the military government of the military forces of the United States, I have decided that patents and trade-marks of all description, printed matter, titles and labels, duly registered in the Patent Office of the United States, for whose protection in this Island application shall hereafter be made, from this date, by filing the same, shall be registered in the department of which I have charge if admissible, upon observing the procedure followed for the registration of those of other countries and upon the payment of $25.00 currency for patents and of $12.50 currency for trade-marks, prints, etc., that is to say the same fees as are paid by the other foreign and national marks and patents, in lieu of the one peso, currency, indicated with regard to the American, in said circular No. 21.

I avail myself of this opportunity, etc.

GONZALO DE QUESADA.

To H. E. The Hon. JOHN HAY,
Secretary of State of the United States.

Photographic Copies of Drawings.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., July 1, 1902.

The Patent Office is now prepared to furnish black line on white ground copies of any unbound drawing, foreign or domestic, which may be in its possession, instead of the blue-prints heretofore furnished. Only the 7x11 (patent) size and the full or 10x15 size prints will hereafter be furnished, at 15 and 25 cents per sheet, respectively.

Copies of drawings of pending, abandoned, forfeited, or informal cases and of caveats may be had in either of the above-named sizes except when they are to be certified, in which case they must be the 10x15 size.

Copies of United States or foreign patent drawings will be made only in the 10x15 size.

When ordering copies of foreign patent drawings, either the serial number of the applications in which they were cited as references or the class and subclass where they may be found must be given. The title of the invention or the number of the division will not be sufficient. Bound volumes cannot be used for making prints. Failure to give the fullest data whereby the mounted drawing may be found will result in delay and unnecessary correspondence.

The work will be much facilitated if a separate order be made for each drawing. The Office will furnish, gratuitously, blanks for this purpose on request.

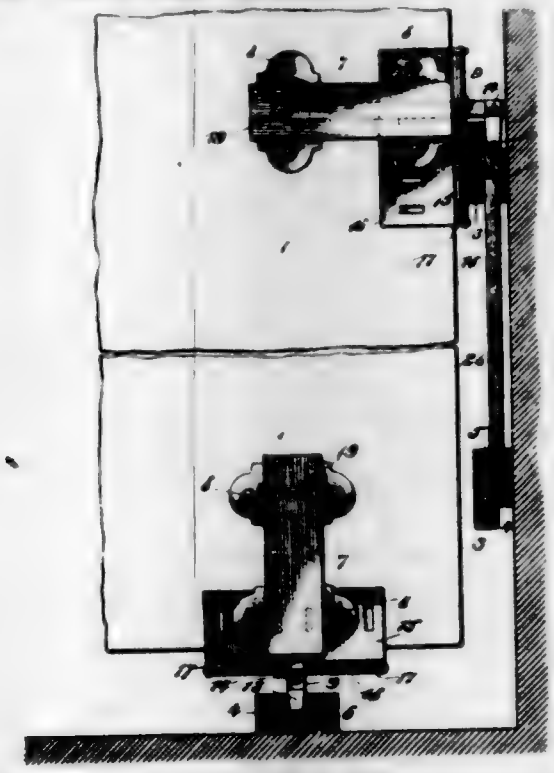
As a result of abolishing the small (5x8) size the requirement that duplicate prints must be ordered in certain cases will no longer be enforced. The requirement that less than all the sheets of a case will not be printed unless there is already a full set in the file will not be insisted upon; but applicants or attorneys are strongly urged to file a set of prints or order them to be made by the Office at the time of filing an application. Such procedure will save delay later if correction of the drawing is desired or required.

F. I. ALLEN,
Commissioner.

PATENTS

GRANTED JULY 22, 1902.

705,010. **SELF-ADJUSTING DUMB-WAITER GRIP AND FRICTION-ROLLER.** FRANK ACKERMAN, New York, N. Y. Filed Jan. 3, 1902. Serial No. 88,284. (No model.)

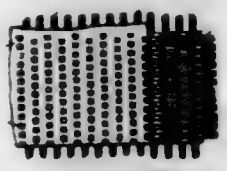


Claim.—1. A dumb-waiter grip in which is comprised a casing arranged for securing to a car, in combination with a spring-controlled bar or bolt provided at its outer extremity with a guide-tongue adapted and arranged to engage with a guide-strip, substantially as shown and described.

2. A dumb-waiter grip in which is comprised a casing arranged for securing to a car, in combination with a spring-actuated bar or bolt provided at its outer extremity with an adjustable guide-tongue adapted and arranged to engage with a guide-strip, substantially as shown and described.

3. A dumb-waiter guide and grip in which is comprised a casing arranged for securing to a car, in combination with a spring-actuated bar or bolt provided at its outer extremity with an adjustable guide-tongue adapted and arranged to engage with a guide-strip, and a friction-roller located at the front of the casing, substantially as shown and described.

705,011. **TYMPAN-SURFACE FOR PRINTING-PRESSES.** ARTHUR S. ALLEN, Boston, Mass. Filed Oct. 29, 1896. Serial No. 594,861. (No model.)



Claim.—1. A tympan containing sheet metal cut to form a spring, a series of such springs laid side by side, the projections of one spring entering the spaces of an adjacent spring, and a bracing applied to said springs and entering the interstices thereof.

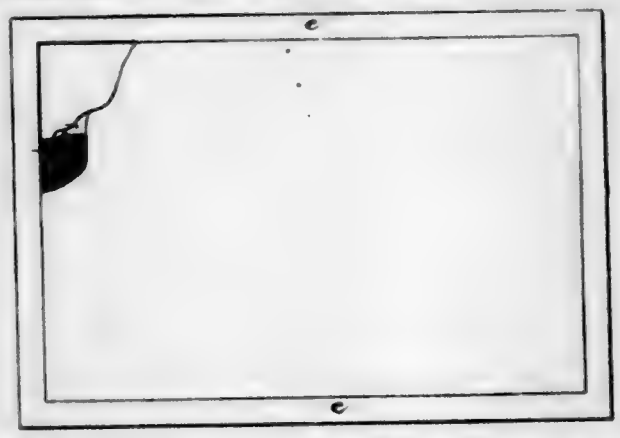
2. A tympan composed of a series of sheet-metal springs presenting a series of slots and projections, the projections of one spring entering the spaces of an adjacent spring, to thereby bring the supporting portions of each projection at the surface of the tympan more closely together, and a bracing applied to said springs and entering the interstices thereof, substantially as described.

3. In a tympan, a series of sheet-metal springs having a series of slots and projections, the projections of one spring entering the slots of an adjacent spring, and a mesh-wire inserted longitudinally through a plurality of said springs, to thus lock them positively together, and a bracing applied to said springs, and filling the interstices thereof, substantially as described.

4. In a tympan, a series of sheet-metal springs having a series of slots and projections, said springs being laid side by side, the projections of one spring entering the slots of an adjacent spring, substantially as described.

5. In a tympan, a series of sheet-metal springs having a series of slots and projections, said springs being laid side by side, the projections of one spring entering the slots of an adjacent spring, and mesh-wires inserted longitudinally through a plurality of said springs, to lock them positively together, substantially as described.

705,012. **BED FOR TYMPAN-SURFACES.** ARTHUR S. ALLEN, Boston, Mass. Filed Jan. 19, 1899. Serial No. 702,694. (No model.)



Claim.—1. A tympan-surface for use in connection with printing-presses, said tympan-surface comprising a metallic backing and spring-wire united to said metallic backing by a suitable binder, substantially as described.

2. A tympan-surface for use in connection with printing-presses, the same consisting of a metallic backing, and wire united thereto by solder or equivalent material, substantially as described.

3. A tympan-surface for use in connection with printing-presses, the same consisting of a backing, wire applied to the backing, and a binder capable of being softened by heat, said binder receiving the wire and when cooled holding the wire substantially fixedly in position upon the backing, substantially as described.

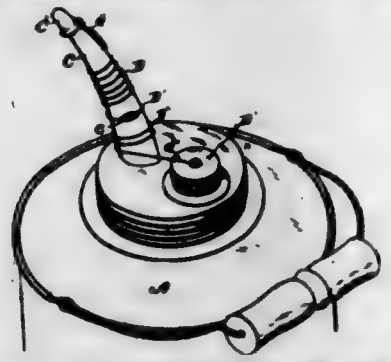
4. A tympan-surface for use in connection with printing-presses, the same composed of a metallic backing, a series of spring-coils laid side by side, the turns of the spring-coils being interlocked or passed one within the area described by the other, and solder in which part of the coils are embedded to hold the spring-coils in their locked positions on or with relation to the said backing, substantially as described.

5. A tympan-surface for use in connection with printing-presses, the same being composed of a backing, and spring-wire having coils or turns held fixedly in place on said backing by a binder in which part of said coils are embedded, and a leveling-sheet applied to the portions of the wire which extend above the backing and the binder, substantially as described.

6. In combination, a tympan-surface to be used as a surface in printing, said tympan-surface being composed of spring material bent to present turns or coils, a case composed of flexible material and having a pocket or space for holding the tympan-surface, the projecting face of the tympan-surface formed from said spring material being located at or near the upper edge of the said case, substantially as described.

705,018. **OIL-CAN.** JEROME A. BABUERLE, Kalamazoo, Mich. Filed Nov. 20, 1901. Serial No. 84,128. (No model.)

Claim.—1. In an oil-can, the combination of a body portion having an opening B and a spout C; caps B' and C' for said opening and spout; a coiled spring D embracing and secured to said spout; and said caps secured to the free ends of said springs whereby said caps will be held in an elevated position by said spring when they are released, as specified.

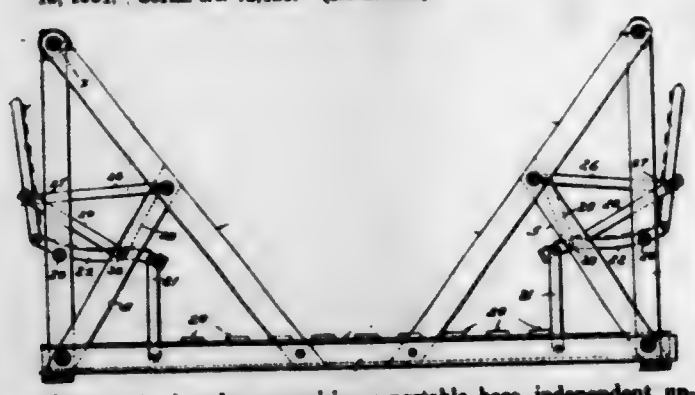


2. In an oil-can, the combination of a body portion having an opening B and a spout C; caps B' and C' for said opening and spout; a spring secured to said spout; and said caps secured to the free ends of said springs whereby said caps will be held in an elevated position by said spring when they are released, as specified.

3. In an oil-can the combination of a body portion having a spout; a coiled wire spring secured to and embracing said spout; a cap or closure for the said spout secured to the free end of said spring whereby said cap will be held on said spout by spring tension and held in an elevated position when released from said spout as specified.

4. In an oil-can the combination of a body portion; a coiled wire spring adapted to embrace and secured to the spout of said body portion; a cap or closure secured to the free end of said spring whereby said cap will be held in an elevated position when released from the said body portion.

705,014. SWING. JACOB HAHN, Sr., St. Henry, Ohio. Filed Aug. 15, 1901. Serial No. 72,123. (No model.)

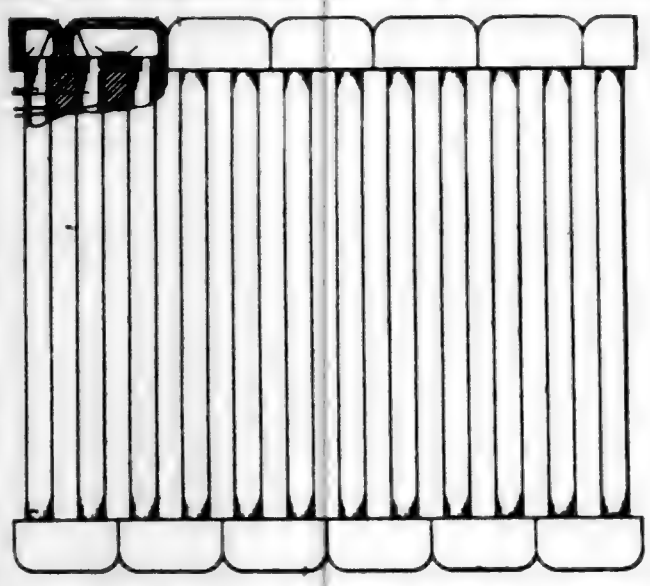


Claim.—1. A swing comprising a portable base, independent uprights at the corners of said base, swing supporting-bars pivotally suspended from each upright, rods connecting said bars in pairs at their lower ends and above the same, a platform notched to have a removable pivotal connection with the lower connecting-rods, a seat at each end of the platform notched to have a removable pivotal connection with the upper connecting-rod, and independent supports connected with and supporting the forward edge of each seat, said supports being parallel with the supporting-bars and pivotally connected at their ends to the seat and platform, substantially as described.

2. In a swing of the character described, the combination with a platform and pivotally-mounted bars whereby it is suspended, of a seat pivotally connected to the supporting-bars and having independent supports, parallel with the supporting-bars and pivotally connected at their ends to the seat and platform, a back pivotally connected with the seat, arms having pivotal connections with the back, at one end, pivoted links connecting the other end of the arms to the seats, and adjusting-braces pivoted to the seat at their forward ends by the same connections as the links, and having at their rear ends a plurality of apertures whereby they may be adjustably connected to the back by means of the same pivotal connections as the arms, substantially as described.

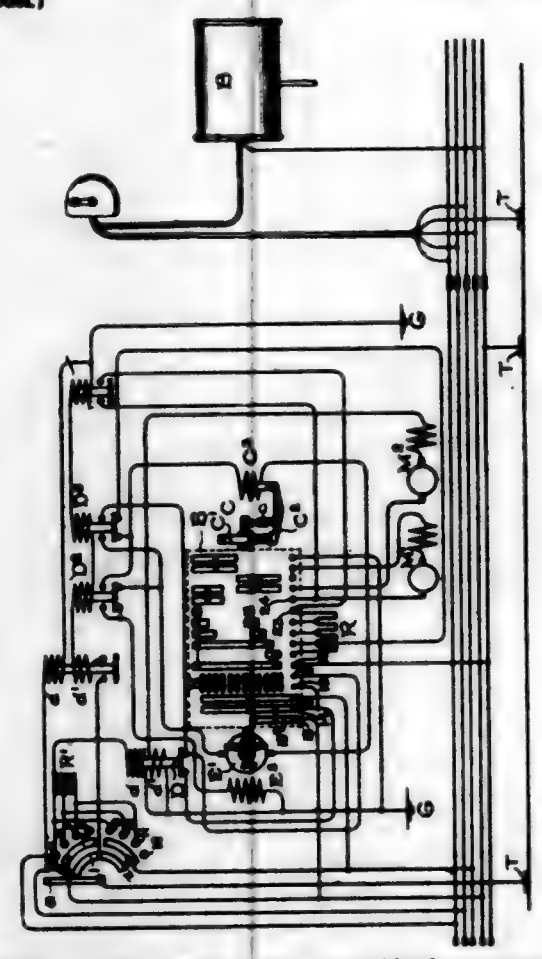
705,015. CONGEALING BODY OR PLATE FOR ICE-MAKING MACHINES. EDWARD BARRATH, Philadelphia, Pa., assignor of two-thirds to John J. Keller and Augustus Britney, Philadelphia, Pa. Filed Dec. 6, 1901. Serial No. 84,504. (No model.)

Claim.—1. A freezing plate or body, comprising a series of pipes of parallelogrammatic cross-section intermediate of their ends, said ends being rounded, a series of return-bends connecting the rounded ends of said pipes to form with the pipes a continuous coil for the passage of the freezing medium, and a series of solid metallic bars arranged between and separating adjacent pipes in the series of pipes, said bars being of a width corresponding to the depth of the parallelogrammatic pipes and having sides parallel to and abutting against the sides of the adjacent pipes and the freezing-surface of said bars being arranged in the plane of the freezing-surface of the pipes, substantially as and for the purposes described.



2. A freezing plate or body, comprising a series of pipes connected at their ends to form a coil, a series of metallic bars and insulating material interposed between the pipes, said pipes and bars having exposed freezing-faces in alinement, and the sides of the pipes abutting against and lying in planes parallel to the sides of the interposed bars and insulating material, the area of the freezing-face of the bar being coequal with the combined area of one side of the bar and of the side of the insulating material abutting against one side of an adjacent pipe.

705,016. TRAIN-CONTROL SYSTEM. CHARLES H. BARRY, Schenectady, N. Y., assignor to the General Electric Company, a Corporation of New York. Filed Dec. 16, 1896. Serial No. 616,409. (No model.)



Claim.—1. In a motor system, in combination, a controller, automatic means for preventing the operation of the controller whenever the current in the motor-circuit rises above a predetermined value, and means for modifying the operation of said automatic means.

2. In a train-control system, in combination, automatic means for limiting the rate of acceleration to a predetermined value, and means for

modifying the operation of the said automatic means so as to change the limiting rate of acceleration to a different value.

3. In combination, a motor or motors, a motor-controller, actuating means for said controller, a master-controller, and means controlled in part by the current in the motor-circuit, and in part from the master-controller, for controlling the operation of said actuating means.

4. In combination, a motor or motors, a motor-controller, electromagnetic actuating means for said controller, a switch for opening the circuit of the electromagnetic actuating means, and actuating-winding therefor included in circuit with the motor or motors and arranged to open the switch whenever the current in the motor-circuit rises above a predetermined limit, a master-controller by means of which an operator may control the operation of the motor-controller, and means also under the control of the operator for changing the limit at which the said switch will be operated.

5. In a train-control system, motors and a motor-switch, a pilot-motor for actuating the said switch, means controlled by the current-flow in the main motors for opening the pilot-motor circuit, and means under the control of the motorman for retarding or accelerating the opening of the circuit so as to increase or decrease, as may be desired, the permitted main current, and thus correspondingly change the acceleration of the train.

6. The combination, with motors and a motor-switch, a pilot-motor actuating the switch, and a master-controller for the pilot-motor, of an open-circuiting device for the pilot-motor, and means controlled by the master-controller for modifying the action of the open-circuiting device.

7. The combination of motors and a motor-switch, a pilot-motor, and a master-controller, with a throttle for the pilot-motor circuit comprising a coil, means for varying the ampere-turns of the coil, and a part movable under the influence of the coil, actuating the switch controlling the pilot-motor circuit.

8. In an open-circuiting device for the pilot-motor of a train-control system, the combination of a coil the effect of which is regulated by the master-controller, with another coil in series in the motor-circuit, a part movable under the influence of the coils, and a switch operated by the moving part.

9. In a throttle or open-circuiting device for the pilot-motor of a train-control system, the combination of a coil, a regulable resistance in circuit with the coil, means on the master-controller for varying the regulating resistance, a second coil in circuit with the motors, and a switch controlled by the coils.

10. The combination with motors and a motor-controller, of a pilot-motor operating the controller, a throttle or open-circuiting device for the pilot-motor, and means upon the controller for bridging the throttle-contacts until the controller reaches certain predetermined positions.

11. The combination of motors and a motor-controller, with a pilot-motor actuating the controller, an open-circuiting device or throttle in the circuit of the pilot-motor and controlled by the current-flow in the motor-circuit, and bridging contacts operated by the controller, maintaining the circuit of the pilot-motor until the controller reaches certain definite positions.

12. The combination with the throttle or open-circuiting device for the pilot-motor of a train-control system, of fixed contacts in the motor-controller connected to those of the throttle, and moving contacts carried by the main motor-switch for bridging the fixed contacts at desired times.

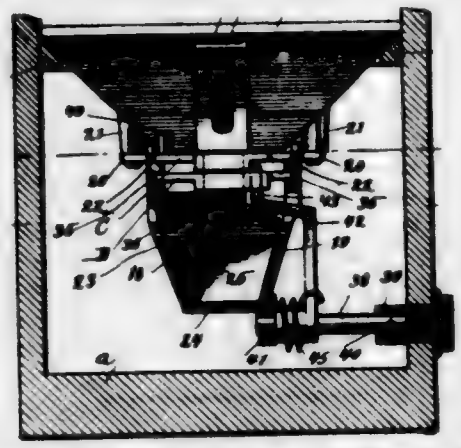
13. The combination with the throttle or open-circuiting device for the pilot-motor of a train-control system, of means for short-circuiting said throttle to prevent its operation.

14. The combination with the throttle or open-circuiting device for the pilot-motor of a train-control system, of means located at the point from which the train is for the time being controlled for modifying the operation of said throttle.

15. The combination in a train system, of one or more motors, a controller therefor, a pilot-motor for operating said controller, a switch in the pilot-motor circuit, an actuating-winding for said switch arranged to open the pilot-motor circuit whenever the current in the motor-circuit rises above a predetermined limit, and means located at the point from which the train is for the time being controlled for increasing the limit at which the said switch will be operated.

705,017. COIN-CONTROLLED APPARATUS. ALBERT BAUMGARTEN, Freeport, Ill. Filed June 1, 1901. Serial No. 62,697. (No model.)

Claim.—1. In a vending-machine, the combination with a case provided with a storage-compartment, a hopper, and a slidable valve beneath said hopper, of mechanism for shifting said valve, said mechanism comprising a slidable coin-shifter, a crank-arm connected to said shifter, and an operating-handle, said valve and shifter having corresponding coin-slots so arranged that a deposited coin will cause the unison shift of the valve and shifter, a coin-support beneath said coin-slots and side frames in which said valve and said shifter are held, said side frames being secured to said hopper, said frames and hopper being removably held in said case.



2. In a vending-machine, the combination with a case provided with a storage-chamber, a hopper and a slidable valve, of a slidable coin-shifter, vertically-extending side frames secured to said hopper, a horizontal guideway for said shifter, formed in each of said side frames, a horizontal guideway for the valve and formed in each of said side frames, said guideways for said valve and shifter being arranged one above the other and separated from each other, and an operating-handle suitably connected with said shifter, corresponding coin-slots in said valve and shifter arranged so a deposited coin will cause the unison shift of said slide and valve, and a coin-support beneath said slots.

3. In a vending-machine, the combination with a case provided with a storage-chamber, a hopper and a slidable valve, of a slidable coin-shifter, vertically-arranged side frames secured to said hopper, a guideway for the valve and formed in each of said side frames, a guideway for the shifter and formed in each of said side frames, and below said valve-guides and separated therefrom, said valve and shifter being provided with corresponding coin-slots arranged so that a deposited coin will cause the unison shift of said shifter and said valve, a slot extending vertically through said shifter, a crank-arm having its upper terminal extended in the direction of its length and through said slot, an operating-handle connected with said crank-arm and a coin-support beneath said coin-slot.

4. In a vending-machine, the combination with a case provided with a storage-compartment, a hopper and a slidable valve, of mechanism for shifting said valve, said mechanism comprising a slidable coin-shifter, a crank-arm connected to said slide, and an operating-handle, said valve and said shifter having coin-slots so arranged that a deposited coin will cause the shifter and valve to move in unison, side frames in which said slide and valve are held, and a fixed coin-support beneath coin-slots and integrally formed with one of the side frames.

5. In a vending-machine, the combination with a case provided with a storage-chamber, a hopper and a slidable valve, of mechanism for shifting said valve, said mechanism comprising a slidable coin-shifter, a crank-arm connected to said shifter and an operating-handle, said valve and said shifter having coin-slots so arranged that a deposited coin will cause the shifter and valve to move in unison, side frames in which said slide and valve are held, and a fixed and toothed coin-support beneath coin-slots and integrally formed with one of the side frames.

6. In a vending-machine, the combination with a case provided with a storage-chamber, a hopper and a slidable valve, of mechanism for shifting said valve, said mechanism comprising a slidable coin-shifter, a crank-arm connected to said slide, and an operating-handle, said valve and said shifter having coin-slots so arranged that a deposited coin will cause the shifter and valve to move in unison, side frames in which said slide and valve are held, a chute for directing the discharged material to outside of the case, said side frames being extended to form the side walls of said chute, and a fixed coin-support beneath said coin-slots.

7. In a vending-machine, the combination with a case provided with a storage-chamber, a hopper and a slidable valve, of mechanism for shifting said valve, said mechanism comprising a slidable coin-shifter, a crank-arm connected to said slide, and an operating-handle, said valve and said shifter having coin-slots so arranged that a deposited coin will cause the shifter and valve to move in unison, side frames in which said shifter and valve are held, a chute for directing the discharged material to outside of the case, said side frames being extended to form the side walls of said chute, and a fixed coin-support beneath said coin-slots, integrally formed with one of said side frames.

8. In a vending-machine, the combination with a storage-compartment, a hopper and a movable valve, of coin-controlled mechanism for shifting said valve, a coin-detector comprising a holder and an ejector provided with an inwardly-projecting cam, said ejector being arranged

to positively shift a coin from said holder, and a stud, on said valve and arranged to engage said cam and shift said ejector.

9. In a vending-machine, the combination with an inclosing case provided with a removable door, a storage-compartment, a hopper and a movable valve, of coin-controlled mechanism for shifting said valve, and a coin-detector carried by said door and comprising a holder and an ejector provided with an inwardly-projecting cam, said ejector being arranged to positively shift a coin from said holder, and a stud on said valve and arranged to engage said cam and shift said ejector.

10. In a vending-machine, the combination with an inclosing case provided with a removable door, a storage-compartment, a hopper, a slidable valve and coin-controlled mechanism for shifting said valve, of a coin-detector carried by said door, and comprising a coin-holder and an ejecter, pivotally sustained to swing parallel to the door-face, and provided with an inwardly-projecting cam, said ejector being arranged to positively shift a coin from said holder, and a stud on said valve and arranged to engage said cam to shift said holder, said valve being movable transversely to the travel of said ejector

---

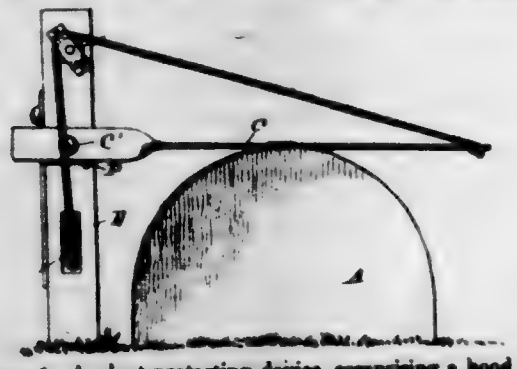
705,018. DROPPING ATTACHMENT FOR MEDICINE-BOTTLES. ABSOLOM C. BECKWITH, Brooklyn, N. Y. Filed Oct. 24 1901. Serial No. 79,796. (No model.)

Claim.—1. A dropping attachment for medicine-bottles, consisting of a tubular spout applied to the neck of the bottle, a valve for opening and closing said spout, a fulcrumed and spring-actuated lever for operating said valve, an air-tube arranged in said spout and communicating with an opening provided in the same adjacent the end thereof, a spoon-holding attachment formed with the spout so that the spoon can be adjusted in proper relative position to the end of the spout, substantially as set forth.

2. A dropping attachment for medicine-bottles, consisting of a tubular spout, a valve for opening and closing said spout, a fulcrumed and spring-actuated lever applied to one side of the spout and a spoon-clamping attachment at the opposite side so as to hold the bowl of the spoon in proper relative position to the spout, substantially as set forth.

3. A dropping attachment for medicine-bottles, consisting of a tubular spout applied to the neck of the bottle, an air-tube with closed upper end, an opening in the side of said spout communicating with said air-tube adjacent the closed end thereof, a spring-actuated lever having a valve for opening and closing said spout, said lever being fulcrumed to said spout and disposed parallel thereto, a supporting device for the spoon of U shape horizontal cross-section and being formed integral with the spout, and a clamping means provided therewith for adjustably securing the spoon in proper relation with the end of the spout, substantially as set forth.

705,019. PLANT-PROTECTOR. EDWARD C. H. BEERENS, Charleston, S. C. Filed Oct. 4, 1901. Serial No. 77,610. (No model.)



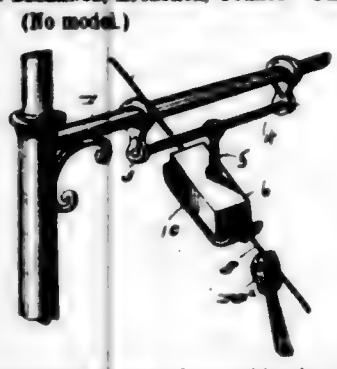
Claim.—1. A plant-protecting device comprising a hood, a series of posts, pivotal arms mounted, one on each post and each fastened to the hood, a rope fastened to the end of each arm and passing about suitable pulleys, locking means, and means for automatically operating the same, as set forth.

2. A plant-protecting device comprising a hood, a series of posts, an arm pivoted to each post and fastened to the hood, a rope passing about suitable pulleys on the post and connected at one end to said arm, a pivoted locking-plate mounted on each post, and having a projecting portion on one edge thereof, and means for throwing said plates out of the path of the rear ends of said arms, as set forth.

3. A plant-protecting device comprising a hood, posts, a pivotal arm carried by each post and fastened to the hood, a rope fastened to the outer end of each arm and passing about pulleys on the post, an adjustable plate pivotally mounted on each post and having a projecting portion adapted to form a stop to prevent the arm being thrown above a horizontal position, and means for throwing said plates out of the path of the rear ends of the arms as the ropes are drawn upon, as set forth.

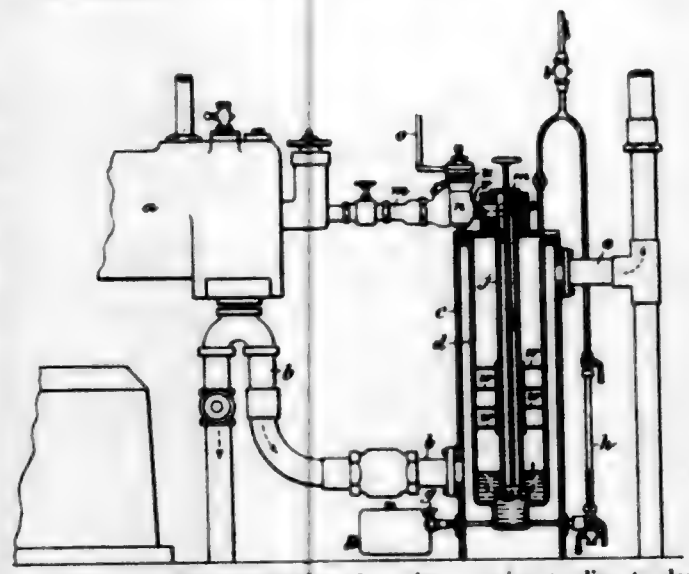
4. A plant-protecting device comprising a hood, a series of ribs spaced apart, posts, an arm pivoted to each post, a rope fastened at one end to the said arm and passing about pulleys on the post, a plate pivoted to each post, a main operating-rope secured to each of said ropes which pass about said pulleys, collars on said main operating-rope, bracket-plates secured to the locking-plates, and against which bracket-plates said collars adapted to strike to throw the locking-plates so that projecting portions thereof will be out of the path of the pivotal ends of the arms, as set forth.

705,020. SAFETY CONTACT-INTERRUPTER FOR ELECTRIC WIRES. GASTON BELLANGÉ, Arcachon, France. Filed Sept. 9, 1901. Serial No. 74,755. (No model.)



Claim.—In a contact-interrupter, the combination of a casing having a quantity of mercury therein, of a hanger centrally secured to said casing, conductor-wires extending entirely through the ends of said casing and engaging said mercury, a pair of suitably-mounted supports suitably spaced apart carrying a rod, the upper end of said hanger being centrally and movably mounted on said rod, and a plate carrying a V-shaped projection mounted on the under face of the said casing for engagement with the trolley-wheel, substantially as described.

705,021. CARBURETER. JAMES F. BENNETT and HEDLEY S. MOORWOOD, Sheffield, England. Filed Mar. 10, 1902. Serial No. 97,462. (No model.)

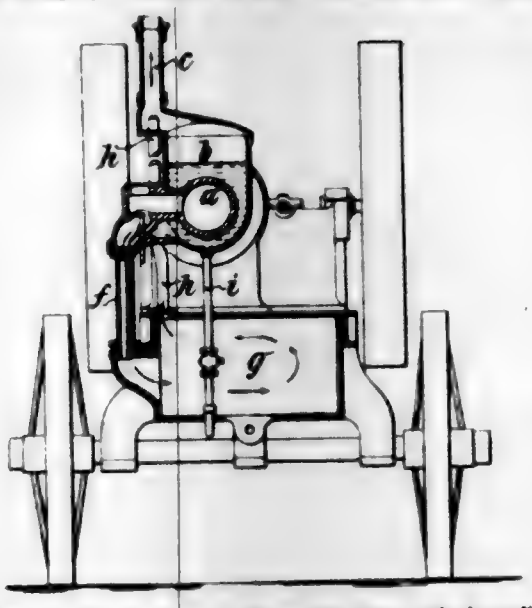


Claim.—1. The combination of a valve, a spring tending to close the valve, an oil-supply pipe leading to the valve, a reservoir for liquid hydrocarbon, a pipe connecting the valve and reservoir, means for admitting air into the pipe, and means for exhausting air and vapor from the reservoir.

2. The combination of a cylinder, means for admitting air to the cylinder, a piston in the cylinder, an oil-supply pipe leading into the cylinder, a valve on the piston controlling the oil-supply, a spring acting on the piston and tending to close the oil-supply, a pipe leading from the cylinder, means for admitting air into the pipe, a reservoir for liquid hy-

drocarbon into which the pipe dips and means for exhausting air and vapor from the reservoir.

705,022. EXPLOSIVE-ENGINE. WILHELM BERNHARDT, Vienna, Austria-Hungary. Filed Nov. 24, 1900. Serial No. 37,062. (No model.)



Claim.—1. In a gas-engine, the combination with the cylinder, of a chamber containing cooling liquid surrounding the same, an air inlet and outlet to said chamber both above the level of the liquid therein, and an exhaust-pipe from the engine arranged to exhaust gas into said air-outlet and thereby induce a current of air over the surface of the cooling liquid, substantially as described.

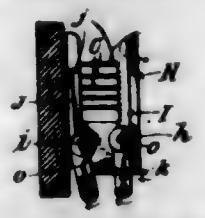
2. In a gas-engine, the combination with the cylinder, of a chamber containing liquid surrounding the same, an air-inlet to said chamber above the level of the liquid therein, and an injecter connected to the chamber and operated by exhaust-gases from the cylinder, whereby a current of air is created across the surface of the liquid in said chamber, substantially as described.

3. In a gas-engine, the combination with the cylinder, a chamber containing a cooling liquid surrounding the same, air inlet and outlet pipes for said cooling-chamber both above the level of the liquid therein, of an exhaust-chamber connected with the exhaust-valve, and an exhaust-pipe leading from said exhaust-chamber and leading into the air-outlet pipe of said chamber, substantially as described.

4. In a gas-engine, the combination with the cylinder, of a chamber containing a cooling liquid surrounding the same and provided with an air-space above the liquid, an air-inlet at one end and an air-outlet at the opposite end of said cooling-chamber, an exhaust-chamber, a pipe connecting the cylinder with the exhaust-chamber, and a pipe leading from the exhaust-chamber and terminating in the outlet-pipe, substantially as and for the purpose specified.

5. In a gas-engine, the combination with the cylinder, of a chamber containing a cooling liquid surrounding said cylinder and provided with an air-space above the liquid, means for automatically supplying said liquid to the chamber, an air-inlet mounted in one end of said cooling-chamber above the air-space, and an air-outlet mounted in the opposite end of said chamber, an exhaust-chamber, a pipe leading from the cylinder to the bottom of the exhaust-chamber, and a pipe leading from the top of said exhaust-chamber and terminating in the air-outlet, substantially as and for the purpose specified.

705,023. MUSIC-SHEET TURNER. CHARLES E. BERTOGLIATTI. New York, N. Y. Filed Mar. 15, 1902. Serial No. 98,300. (No model.)



Claim.—In a leaf-turning device, a plurality of spring-actuated arms and means carried thereby which grasp in each instance a sheet of music in combination with two pawls I J, arranged on opposite sides of the said arms for holding the latter motionless against the stress of the said springs, and a lever having a bifurcated end for operating the said pawls alternately to release the said arms individually in succession after the manner of an anchor-escapement as the said lever is depressed substantially as set forth.

705,024. SUPPORT FOR LIMBS. MYRON H. BIGBEY, Kirksville, Mo. Filed May 20, 1901. Serial No. 61,059. (No model.)

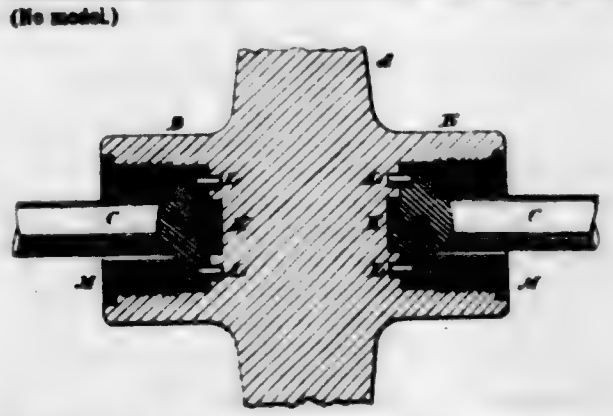
Claim.—1. In a device for supporting limbs to be treated, the combination with a hook-body, a yoke-like head mounted thereon and a cam-body 14 eccentrically journaled in said head, of a bar 17 extending through said head in rear of the cam-body, said bar having its upper end provided with a yielding support, a strap depending between said cam-body and bar 17 and adapted to be clamped between said parts and means for supporting the upper portion of said strap above said head, substantially as specified.

2. In a device for supporting limbs to be treated, the combination with a hook-rod having a cushioned hook portion 2, a yoke-like head carried on the upper end of said rod and a locking-cam journaled in said head, of a spring-supported bar 17 depending in rear of said locking-cam, a binding-shoe 19 carried on said bar 17 and having inclined upper portions as described, adjustable screws 21 extending on opposite sides of the bar 17 and adapted to contact with said shoe and a suspending-strap supported from a point above the head 13 and passing between said shoe and cam-body, substantially as specified.

3. In a device for supporting limbs to be treated, the combination with a hook-body comprising a lower section 11 having a cushioned hook-termination and a hollow upper section 4 within which said lower section telescopes and means for detachably and adjustably connecting said sections, of a yoke-like head for said upper section, a locking-cam 14 journaled therein, a spring-supported bar 17 depending in rear of said cam and a suspending-strap supported from a point above said head and depending between said cam and bar, substantially as specified.

4. In a device for supporting limbs to be treated, the combination with a hook-body, a yoke-like head mounted thereon and a strap binding or clamping mechanism connected with said head, of a reel 24 journaled below said head, a spring connecting said body with a journaled rod or shaft and a strap adapted to wind on said reel by action of the spring and means for suspending the strap from a point above the head 13, substantially as specified.

705,025. SUPPORT FOR STEAM-TURBINE WHEELS. JOHAN A. BOMGREN, Stockholm, Sweden. Filed Apr. 8, 1902. Serial No. 101,870. (No model.)



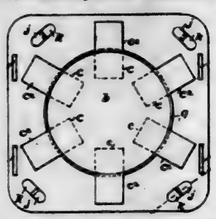
Claim.—1. The combination of a wheel having on opposite sides central internally-threaded sockets, supporting-shafts therefor having enlarged ends in said sockets, and screw-plugs surrounding said shafts and received in said sockets.

2. The combination of a wheel having on opposite sides central internally-threaded sockets, the said sockets in their bottoms having recesses, supporting-shafts for said wheel having enlarged ends to enter said sock-

ons and projections on said ends to enter said recesses, and screw-plugs surrounding said shafts and received in said sockets.

3. The combination of a wheel having on opposite sides internally-threaded sockets, the said sockets in their bottoms having recesses, supporting-shafts C for said wheel having enlarged ends F, G to enter said sockets and a central projection K and projections L to enter said recesses, and screw-plugs M surrounding said shafts and received in said sockets.

705,026. INTERIOR-CONDUIT OUTLET-BOX. WILLIAM F. BOSSERT, Utica, N. Y., assignor to the Bossert Electric Construction Company, Utica, N. Y. Filed May 8, 1902. Serial No. 106,409. (No model.)



Claim.—1. A cover for an outlet-box, consisting of a base or rim provided with orifices for attachment to the box, an opening in the central part of said base surrounded by a collar, an outward extension or extensions from said collar, at a right angle thereto and parallel with the surface of the cover, as set forth.

2. A cover for an outlet-box consisting of a base or rim provided with orifices for attachment to the box, an opening in the central part of said base surrounded by an upright collar, and one or more outward extensions from the said collar at a right angle thereto and parallel with the surface of the cover, as set forth.

3. A cover for an outlet-box, stamped from a thin sheet of malleable metal into a dish shape, a portion of the central part cut out, and the remainder turned outward parallel with the surface of the cover, as set forth.

4. A cover for an outlet-box, stamped from a thin sheet of malleable metal into a shape having two parallel planes united by a collar, the central part of the upper plane cut out and the remainder turned outward parallel with the surface of the cover, as set forth.

5. A cover for an outlet-box, stamped from a thin sheet of malleable metal into a shape having two parallel planes united by a collar, holes cut in the lower plane for the ears of the box, the central part of the upper plane cut out and the remainder turned outward at a right angle to the collar and parallel with the surface of the cover, as set forth.

6. A cover for an outlet-box, provided upon its upper surface with hooks or fingers, as and for the purpose set forth.

7. A cover for an outlet-box having a central orifice, and provided upon its upper surface with hooks or fingers, as set forth.

8. A cover for an outlet-box having a central orifice, and holes for the box-ears, and provided upon its upper surface with hooks or fingers, as set forth.

705,027. SELF-CLEANING SIEVE. ALLEN C. BRADINGHAM, Toledo, Ohio, assignor to Hordyke & Marmon Company, Indianapolis Ind., a Corporation of Indiana. Filed Oct. 2, 1900. Serial No. 31,740. (No model.)

Claim.—1. In a shaking-screen, the combination, of the sieve-cloth, projections secured to and extending down from the under side of said cloth, a floor near thereto, and knockers mounted on and adapted to slide over said floor, which extend up to above the plane of the lower edge of said projections, whereby they are adapted, under the impulse of the movement of the screen, to strike said projections and dislodge adhering material, substantially as set forth.

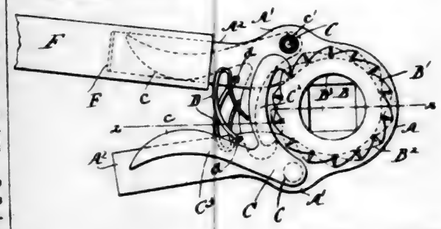
2. In a shaking-screen, the combination, of the sieve-cloth, strips secured to and supported wholly by said cloth and projecting from its surface, a floor near said cloth, and knockers mounted to move on said floor and having parts which project to within the spaces between said strips and adapted to knock against the sides thereof in their movements under the impulse of the movement of the screen, substantially as set forth.

3. The combination, in a shaking screen or sieve, with the cloth thereof, of strips secured to said cloth, a floor beneath said cloth, and knockers composed of two parts one of which extends up on each side of a strip, said knockers being supported on the floor near said cloth and adapted under the impulse of the movement of the screen to hit said strips and dislodge material adhering to said cloth.

705,028. CAR-BRAKE. ABEL BROLASKA, Detroit, Mich. Filed May 12, 1902. Serial No. 106,801. (No model.)

Claim.—In a car-brake, the combination with the brake-shoes mounted on a movable brake-beam; of a casing carried by the car and having a guide, an upright shaft journaled in the casing and having a crank-handle at its upper end, a second shaft journaled in said casing, intermeshing gears fixed on said shafts, a toothed wheel fixed on the second shaft, a rack-bar having flanges above and below its teeth and sliding bodily in said guide while its teeth engage said toothed wheel, and a chain connecting said rack-bar and brake-beam.

705,029. RATCHET-TOOL. ELIJAH R. BROWN and THOMAS R. MCCALL, Cripplecreek, Colo. Filed Nov. 19, 1901. Serial No. 82,862. (No model.)



Claim.—1. In a ratchet-tool, the combination with a head having the stocks A^3, and ring-bearing portion, of a ring in the latter, having differential ratchet-teeth, and normally spring-engaged pawls for the latter, each having an arm contiguous to its stock to be held with the latter and be thrown out of engagement.

2. In a ratchet-tool, the combination with a head having the stocks A^3, and ring-bearing portion, of a ring in the latter having differential ratchet-teeth, and normally spring-engaged pawls for the latter each having an outwardly-tapering arm and cam-face c, said arm adapted to be held with its stock to retain its pawl out of engagement.

3. In a ratchet-tool, the combination with a head having the stocks A^3, and ring-bearing portion, of a ring in the latter having differential ratchet-teeth, and normally spring-engaged pawls for the latter, each presenting the extended elbow C', having the lateral stud-bearing in the head, curved ratchet-hook C^2, and outer curved arm C^3, the latter adapted to be held with its stock to retain its pawl out of engagement.

4. In a ratchet-tool, the combination with a head having the stocks A^3, and ring-bearing portion, of a ring in the latter having differential ratchet-teeth, and bell-crank pawls for the latter, including an outwardly-extending arm, of springs D, each having its secured and free ends contiguous and serving to normally hold its pawl engaged.

5. In a ratchet-tool, the combination with a head having the stocks A^3, and ring-bearing portion, of a ring in the latter having differential ratchet-teeth and bell-crank pawls each having a stud loosely bearing in the head and having its projecting portion embraced by a spring engaging both the stud and head, each of said pawls also having an outer tapering arm C^3, provided with a cam edge and contiguous to the stock.

6. The combination with a ratchet-tool provided with a head having the stocks A^3, ring-bearing portion, ring in the latter having differential bearing-teeth and normally spring-engaged pawls for the latter each having an arm contiguous to its stock, of an operating-handle having a socketed end designed to be slipped over either of the stocks and its pawl-arm to hold that particular pawl disengaged.

7. The combination with a ratchet-tool having the head with stocks

A^3, the bearing-ring, and ring in latter with differential ratchets, and pawls each with outer tapering arm provided with cam edge c, of an operating-handle having a socketed end designed to be slipped over either of the stocks and its pawl-arm to hold that particular pawl disengaged, the socket in the handle being of greater area horizontally than the stocks and tapered portion.

705,030. SHOE FOR GRAIN-DRILLS. WILLIAM F. BROWN, Dowagiac, Mich., assignor to the Dowagiac Manufacturing Company, Dowagiac, Mich. Filed May 10, 1901. Serial No. 59,588. (No model.)

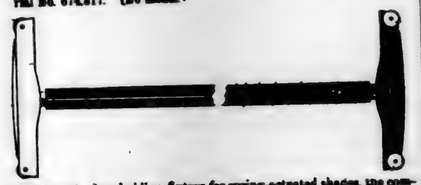
Claim.—1. The combination of the boot A with a wedge-shaped portion A' at the lower end thereof having suitable shoulders A''' above and a vertical slot A'' therein; and a shoe B with a V-shaped opening between its side plates; and a bolt C with an eye C'' embracing a pivot C' through the shoe, the said eye C'' fitting the said slot closely said bolt extending upwardly through the part A' of the boot A.

2. The combination of a boot having a wedge-shaped portion at the bottom with a slot therein; a shoe with side plates forming a V-shaped opening above to embrace the wedge-shaped part of said boot; a bolt secured to a suitable pivot between the sides of the shoe and extending upwardly through the wedge-shaped part of the boot, for the purpose specified.

3. The combination of a boot with a suitable wedge-shaped portion at the bottom containing the vertical slot; and a shoe, the side plates of which form a V-shaped opening above to embrace the wedge-shaped portion of said boot, and a bolt connected with the shoe and extending upwardly for attaching the same to the boot, as specified.

4. The combination of a boot with a suitable wedge-shaped portion at the bottom; and a shoe, the side plates of which form a V-shaped opening above to embrace the wedge-shaped portion of said boot; and a bolt connected with the shoe and extending upwardly for attaching the same to the boot, as specified.

705,031. DEVICE FOR SPRING-ACTUATED SHADES. HOWARD T. BURROWS, Portland, Me., assignor to the Curtain Supply Company, Chicago, Ill., a Corporation of New Jersey. Filed Mar. 23, 1896. Serial No. 674,617. (No model.)



Claim.—1. In a holding-fixture for spring-actuated shades, the combination with a shade, of spring-pressed shoes carried thereby having elongated rocker-shaped friction engaging surfaces, substantially as described.

2. In a holding-fixture for spring-actuated shades, the combination with a shade, of a hollow stick carried thereby and spring-pressed shoes secured to the ends of the stick having elongated rocker-shaped friction engaging surfaces, substantially as described.

3. In a holding-fixture for spring-actuated shades, the combination with a shade, of spring-pressed shoes carried thereby having friction engaging members of elongated rocker shape and antifriction members above and below the rocker-shaped members, substantially as described.

4. In a shade-holding fixture, the combination with the shade, of spring-pressed friction devices carried by the shade located at the edges thereof, the same consisting of elongated shoes having elongated convex friction engaging surfaces between their ends and members of less holding power at opposite ends of the friction-surface and means for supporting the same on the curtain.

5. In a holding-fixture for spring-actuated shades, the combination with a shade, of a stick secured thereto, a friction-shoe at the outer end of the stick, means for securing the same to the stick comprising a rod located in the end of the stick, a spring on the rod for forcing the same outward, removable means at the end of the stick for limiting the outward movement of the rod, and means on the rod with which the limiting means engages.

6. In a holding-fixture for spring-actuated shades the combination with a shade, of spring-pressed shoes carried thereby having elongated friction engaging surfaces formed with outwardly-curved opposite portions extending from the center to the ends thereof.

7. In a holding-fixture for spring-actuated shades the combination with a hollow stick, of a friction-shoe at the end of the stick having a stem, a rod in the stick having a threaded engagement with the stem, a spring on the rod and means fixed in the stick for limiting the outward movement and preventing the turning of the rod; substantially as described.

8. In a holding-fixture for spring-actuated shades, the combination with a shade, of a stitch secured thereto, a friction-shoe at the outer end of the stick, a rod within the stick having a threaded engagement with the shoe, a spring on the rod, an abutment within the stick through which the rod passes and means on the rod engaging the abutment for preventing the turning of the rod, substantially as described.

9. The combination with a stick, of a spring-actuated rod therein, an oblong head at the end of the stick having an extension engaging the stick to prevent independent tilting, an oblong friction member in the head and means for moving the friction-surface independent of the head to vary the position of engaging surface relative to the head.

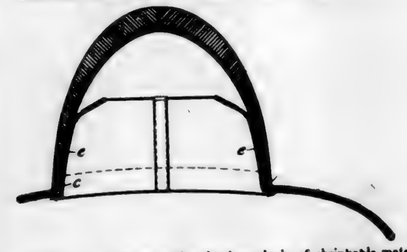
10. In a holding-fixture for spring-actuated shades, the combination with a shade, of spring-pressed shoes carried thereby having elongated oppositely-inclined friction engaging surfaces, substantially as described.

11. In a shade-fixture the combination with a hollow stick, of a friction-head at the end of the stick, an adjustable connection between the head and stick, an adjustable friction-block, and means for adjusting the block on the head.

12. In a frictional shade-holding device, the combination with a stick, of a head at the end thereof, a friction-surface carried by the head, and means for adjusting the friction-surface on the head, and securing the same in adjustable positions.

13. In a shade-holding device, the combination with a stick, of a spring-actuated rod therein, an oblong head at the end of the stick, an oblong friction member in the head and means for moving the friction member independent of the head to vary the position of its engaging surface relative to the head.

705,032. FIREMAN'S HAT. IRVING CAIRNS, Montclair, N. J. Filed May 9, 1902. Serial No. 106,513. (No model.)



Claim.—1. A fireman's hat having a body of shrinkable material and an endless metal band extended upward within the body and flanged outwardly at its lower edge beneath the brim, substantially as described.

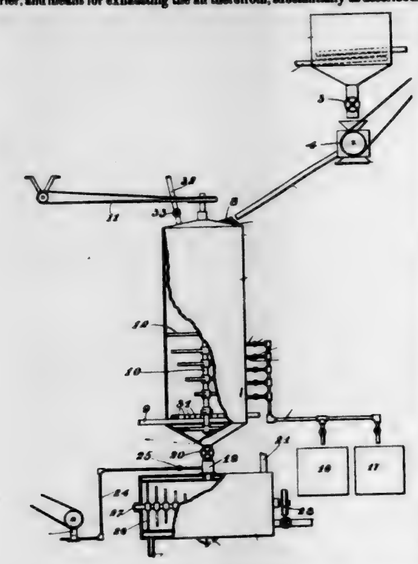
2. A fireman's hat having a body of shrinkable material, an endless metal band extended upward within the body and flanged outwardly at its lower edge beneath the brim, and a lining secured to said flange and extended upwardly within the band and to the hat-body, substantially as described.

705,033. RENDERING APPARATUS. DANIEL CAMERON, Kansas City, Mo., assignor to Cudahy Packing Company, Chicago, Ill., a Corporation of Illinois. Filed Feb. 10, 1902. Serial No. 93,420. (No model.)

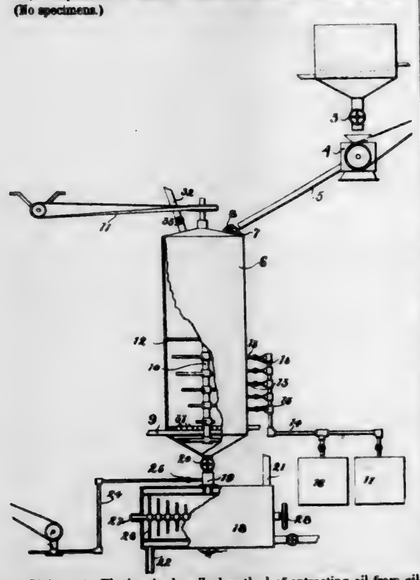
Claim.—1. In an apparatus for separating grease or oils from materials containing the same, the combination with a hopper provided with means for heating the contents thereof, of a grinder adapted to receive and grind the contents of said hopper, a closed separator adapted to receive the subdivided material from the hopper, an agitator for stirring the contents of said separator, means for heating the contents of said separator and for creating a pressure therein, oil-eductious tubes associated with said separator, and a drier for drying the residue, substantially as described.

2. In an apparatus for separating grease or oils from materials containing the same, the combination with a hopper provided with means for heating the contents thereof, of a grinder adapted to receive and grind

the contents of said hopper, a closed separator adapted to receive the subdivided material from the hopper, an agitator for stirring the contents of said separator, means for heating the contents of said separator and for creating a pressure therein, oil-eduction tubes associated with said separator, a steam-jacketed drier for drying the residue, an agitator for said drier, and means for exhausting the air therefrom, substantially as described.



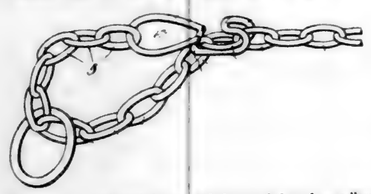
705,084. PROCESS OF EXTRACTING GREASE. DANIEL CARBON, Kansas City, Mo., assignor to Cudahy Packing Company, Chicago, Ill., a Corporation of Illinois. Filed Feb. 10, 1902. Serial No. 93,421. (No specimens.)



Claim.—1. The herein-described method of extracting oil from oil-bearing products containing a substantial quantity of non-oleaginous material, which consists in heating said oil-bearing products, thereafter passing the same through a grinder, where they are subdivided, then passing the products into a separator and subjecting them to heat and pressure, whereby the oils and grease are separated from the residue, withdrawing the lighter oil without adding water to the contents of the separator, and thereafter subjecting the residue to heat in a vacuum to dry the same, substantially as described.

2. The herein-described process of treating oil or grease carrying products containing a substantial quantity of non-oleaginous material, which consists in heating said products, then passing the same through a grinder to subdivide the same, thereafter subjecting said products to heat under pressure in a closed receptacle while agitating said products, thereby to separate the oil or grease from the residue, allowing the oil to rise and then withdrawing the same without adding water to the product, and thereafter subjecting the residue to heat in a closed receptacle, thereby to dry the same, substantially as described.

705,085. SLIP-LINK FOR TRACE-CHAINS. WILLIAM J. CASE, Hartland, Canada. Filed Mar. 17, 1902. Serial No. 98,494. (No model.)



Claim.—1. A slip-link for trace-chains consisting of an endless metal bar having a loop in its rear end, a downwardly-bent heel formed at an intermediate point, and a hook formed at its front end coacting with said heel to retain a link of a trace-chain therein, in combination with a trace-chain attached to said slip-link and having links adapted to be seated and engaged between said hook and heel.

2. A slip-link for trace-chains, consisting of an endless metal bar having a loop in its rear end, a downwardly-bent heel formed at an intermediate point, and a hook formed at its front end coacting with said heel to retain a link of a trace-chain therein, the sides of the forward portion of the link being parallel and approximated to a distance slightly exceeding the thickness of the links of the trace-chain, in combination with a trace-chain attached to said slip-link and having links adapted to be seated and engaged between said hook and heel.

3. The combination of a trace-chain adapted to be passed through a ring or eye to attach it to a whiffletree and to be turned back and fastened to itself, and means for fastening the end of the chain to an intermediate link thereof comprising a slip-link in the form of an endless metal bar looped into the end of the chain and having its rear portion opened into a wide loop, its front portion bent into a hook, and the sides thereof brought together in parallel relation at a distance slightly exceeding the distance of the trace-links and having downwardly, backwardly and forwardly bent intermediate portions coacting with the hook.

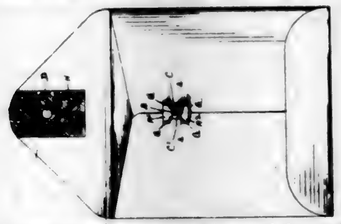
4. The combination of a trace-chain adapted to be passed through a ring or eye to attach it to a whiffletree and to be turned back and fastened to itself, and means for fastening the end of the chain to an intermediate link thereof comprising a slip-link in the form of an endless metal bar looped into the end of the chain and having its rear portion opened into a wide loop, its front portion bent into a hook, and the sides thereof brought together in parallel relation at a distance slightly exceeding the thickness of the trace-links and having downwardly, backwardly and forwardly bent intermediate portions coacting with the hook, the distance between the inside of the hook and bend being approximately equal to the length of one of the trace-links, whereby the latter is adapted to be forced into and seated therein, the adjacent links passing through the slot formed between the two parallel sides of the link, substantially as described.

705,086. ENVELOP. CHARLES E. CATHER and LOUIS H. BUCKLEY, Worcester, Mass. Filed June 3, 1901. Serial No. 62,880. (No model.)

Claim.—1. A metallic fastener consisting of a sheet-metal plate provided at its corners with attaching-spurs adapted to pass through the body of the envelop and be bent over or clenched upon the inside of the envelop and a pair of bendable tongues integral with said plate and projecting therefrom upon opposite sides of said plate.

2. The combination with the body of an envelop, of a fastening device consisting of a plate provided with spurs for the attachment of the plate to the body of the envelop, and a pair of bendable tongues projecting from the opposite sides of said plate, and between said spurs, said plate being slit on opposite sides of said tongues on line parallel with said tongues, whereby the length of said tongues is increased.

3. In a merchandise-envelop, the fastening device consisting of a plate provided with attaching-spurs F, F and a pair of bendable tongues C, C said plate being slit on opposite sides of said tongues, on lines parallel with said tongues whereby said tongues are bendable on lines near the center of said plate and said attaching-spurs are bendable on lines farther from the center of said plate, substantially as described.

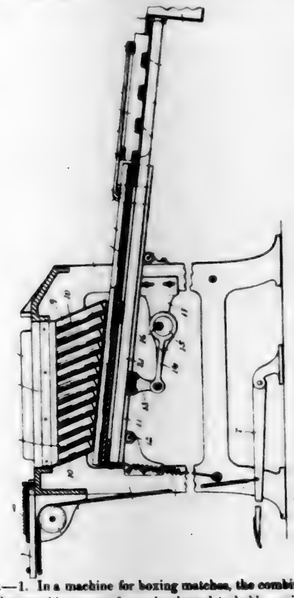


4. A metallic fastener consisting of a sheet-metal plate provided at its corners with attaching-spurs adapted to pass through the body of the envelop and be bent over or clenched upon the inside of the envelop and a pair of bendable tongues integral with said plate and projecting therefrom upon opposite sides of said plate, each of said tongues being placed midway between the attaching-spurs upon the same side of the plate.

5. A metallic fastener consisting of a sheet-metal plate provided with bendable tongues projecting in opposite directions from the sides of said plate and attaching-spurs formed on the ends of arms extending laterally from the sides of said plate, whereby the resistance offered by said attaching-spurs to the strain incident to the bending of said tongues is increased, substantially as described.

6. A metallic fastener composed of sheet metal, and comprising two cross-bars A', A^2, connected together at their central portions by a neck B, from the center of which and integral therewith are the bendable tongues C, C', of much less width than the length of the neck and capable of being bent so as to bring the tips C^3, near each other and in position to pass through the opening in the flap to be fastened, each cross-bar having a spur F at its outer ends adapted to pass through the body of the envelop and be bent over or clenched upon the inside of the envelop, whereby the envelop-fastener is securely attached to the body of the envelop.

705,087. MACHINE FOR BOXING MATCHES. CHARLES F. CHRIST, Detroit, Mich. Filed Aug. 12, 1901. Serial No. 71,693. (No model.)



Claim.—1. In a machine for boxing matches, the combination with longitudinally-movable ways, of a rack adapted to hold a series of transverse rows of match-boxes all lying in the same horizontal plane, a frame provided with downwardly-projecting parallel partitions adapted to enter the match-boxes and divide the same into two parts, said partitions being cut away at their lower sides opposite the ends of the boxes adjacent to each other.

2. In a machine for boxing matches, the combination with means for conveying the matches to the boxes, of a rack for holding match-boxes provided with a series of rows of pockets to receive the boxes, each pocket being open at its top and bottom.

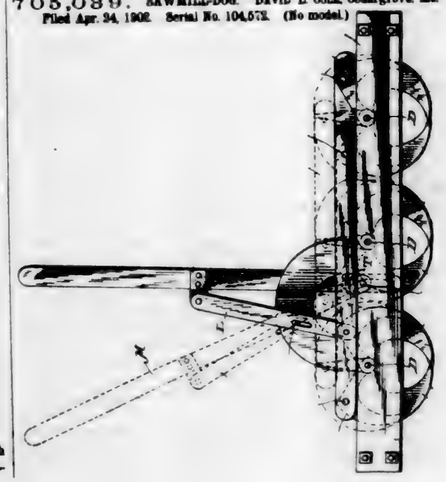
3. In a machine for boxing matches, the combination with ways for conveying the matches, of a rack consisting of a series of transverse bars secured at a distance apart equal to the length of a match-box by end bars, and spacing-strips extending from the edges of said transverse bars and adapted to project between the boxes to form pockets open at the top and bottom.

4. In a machine for boxing matches, in combination with the frame thereof, provided with an opening in its top, a hopper secured within the opening and formed of inclined chutes having concave lower sides, a reciprocating frame beneath said hopper, brackets on the machine-frame, rolls on said brackets to support said reciprocating frame, adjustable brackets in the machine-frame provided with bearings, a driving-shaft in said bearings, an eccentric in said shaft, a hanger on the lower side of said reciprocating frame, an eccentric-rod connecting said hanger and eccentric, a spring secured at one end to the machine-frame, and at the other end to the upper end of the reciprocating frame, an inclined feed-table having a corrugated top forming ways on said reciprocating frame, longitudinal bars secured to the reciprocating frame and extending beyond said feed-table, a tie-bar connecting the lower ends of said bars, a receptacle secured to said tie-bar, a removable box-holding rack having parallel bars and spacing-strips, and a frame pivoted to the reciprocating frame and provided with a series of parallel partitions cut away opposite the parallel bars of the rack to allow the same to enter the match-boxes.

705,088. VEHICLE-TIRE. JAMES CHRISTY, Jr., Washington, D. C. Filed Mar. 20, 1902. Serial No. 99,086. (No model.)

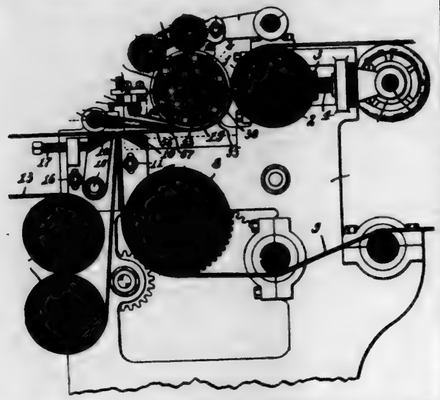
Claim.—The combination with a flanged rim, of a rubber tire thereon, tie-wires extending longitudinally around the tire on opposite sides thereof, and laterally-yielding bars embedded in and extending partly across the tire, said bars having beads forming retaining-hooks under the tie-wires and enlarged bearing-surfaces against and parallel to the inner face of the rim-flanges.

705,089. SAWMILL-DOG. DAVID L. COLE, Cedargrove, Mo. Filed Apr. 24, 1902. Serial No. 104,572. (No model.)



Claim.—A sawmill-dog comprising a rack having three parallel strips, spaced apart, the middle of said strips having a curved segment, a pin carried thereby, a series of pins carried by said middle strip and projecting from the opposite sides thereof, dogs pivotally mounted on said pins in pairs and in reverse directions, strips pivoted to the upper corners of said dogs on opposite sides of the middle strip, an operating-lever having a sliding pivotal connection with the middle strip, and the link having sliding pivotal connection with said segment projection and pivotally connected at one end to the operating-lever and at its other end to the outer one of said strips secured to the upper corners of the dogs, as shown and described.

705,040. **CRACKER-MACHINE.** ALEXANDER W. COPLAND, Cambridge, Mass. Filed Oct. 31, 1901. Serial No. 80,597. (No model.)



Claim.—1. In combination a cylindrical cutter whose cutting-ribs outline spaces thereon; an apron coacting therewith; and supports for that apron to hold the apron in wrapping circumferential contact with the cylindrical cutter.

2. In combination a cylindrical cutter whose cutting-ribs outline spaces thereon and an apron moving therewith and having wrapping contact about a portion of the periphery of the cylindrical cutter and acting to hold the material in the spaces outlined by the cutting-ribs.

3. In combination a cylindrical cutter; a traveling apron having wrapping contact with a portion of the periphery of that cutter; air-passages communicating with the spaces outlined by the cutting-ribs of the cylindrical cutter; and means for supplying compressed air to those spaces.

4. In combination a cylindrical cutter; a traveling apron having wrapping contact with a portion of the periphery of that cutter; air-passages communicating with the spaces outlined by the cutting-ribs of the cylindrical cutter; and means for supplying compressed air to those spaces when only partly covered by the apron.

5. In combination a rotary cutting-cylinder provided with cutting-ribs outlining spaces thereon and having compressed-air passages communicating with such spaces, a traveling apron having wrapping contact with a portion of the periphery of such cutting-cylinder and adapted to engage the outer surface of crackers while their inner surface is subjected to air-pressure, and mechanism for controlling the flow of air to said passages.

6. In combination a rotary cutting-cylinder provided with cutting-ribs outlining spaces thereon and having compressed-air passages communicating with such spaces, a coacting roll contiguous to such cutting-cylinder, a traveling apron passing between said roll and cutting-cylinder and then following in contact with the cutting-cylinder and then leaving the cutting-cylinder, and mechanism for controlling the flow of air to said passages.

7. In combination a rotary cutting-cylinder provided with cutting-ribs outlining cracker-spaces thereon and having compressed-air passages communicating with such spaces, a traveling apron having contact with the periphery of the cutting-cylinder for a distance equal to the circumferential dimension of one of said cracker-spaces and then leaving the cylinder, a conduit for conveying compressed air to said passages, and valvular mechanism for admitting compressed air to the cracker-spaces before the apron separates from the cutting-cylinder.

8. In combination, a cylindrical cutter provided with cutting-ribs outlining spaces thereon, a thin-edged support disposed near the periphery thereof in stripping position, and an endless apron traveling over said thin edge and having that portion of its surface nearest the cutter traveling in a direction opposite that of the contiguous portion of the cutter.

9. In combination a cylindrical cutter provided between its end portions with cutting-rib outlining spaces thereon; means for clearing the crackers from those spaces; and strippers presenting at the end portions of the cutter for stripping the side scrap from the ends thereof.

10. In combination, a cylindrical cutter provided with cutting-rib outlining spaces thereon, a rocking frame mounted on an axis of oscillation parallel with the axis of said cutter, and a cylindrical brush mounted in said rocking frame and engaging the periphery of said cutter.

11. In combination a cylindrical cutter with cutting-rib outlining spaces thereon; exhaust-passages communicating with one or more of said spaces; and means for controlling the flow of air from said spaces.

12. In combination a cylindrical cutter with cutting-rib outlining spaces thereon; air-passages leading to some of such spaces; a conduit adapted to place said air-passages in communication with air-exhausting means; a conduit adapted to place said air-passages in communication with a source of supply of air under pressure, and valvular mechanism adapted to place said air-passages in communication with said first-mentioned conduit and subsequently in communication with the last-mentioned conduit.

13. In combination a rotary cutting-cylinder provided with cutting-ribs outlining spaces thereon and having a cylindrical bore and having air-passages leading from said bore to said spaces, a fixed cylindrical core engaging said bore and having air-passages adapted to communicate with the air-passages in said cylinder as the cylinder turns, a moving surface coöperating with said cylinder to carry the sheet of dough to it and against which the cylinder does its cutting, and an exterior conduit communicating with the air-passages in said core.

14. In combination a rotary cutting-cylinder provided with cutting-ribs outlining spaces thereon and having air-passages communicating with such spaces and having a cylindrical bore, a longitudinally-grooved cylindrical core engaging said bore, a segment of said core disposed within said groove, springs within said core urging said segment outwardly against the bore of said cylinder, air-passages in said segment adapted to communicate with the air-passages in said cylinder as the cylinder turns, and an exterior conduit communicating with the air-passage in said core.

15. In a cracker-machine, a cylindrical cutter provided with cutting-ribs outlining spaces thereon and having a circumferential series of independent longitudinally-extending air-passages near its periphery and having radial passages extending outwardly from said longitudinal passages to said spaces, and a valvular device for controlling communication successively with a portion of each of said longitudinal passages.

16. In combination, a rotary cutter provided with ribs outlining cutting-spaces thereon, a support to retain the cut dough in said spaces, and means for loosening the cut dough in said spaces while retained therein by said support.

17. In combination, a rotary cutter provided with ribs outlining cutting-spaces thereon, an opposing agent against which said cutter may act in cutting dough to become lodged in said spaces, a support to retain the cut dough in said spaces, and pneumatic means for loosening the cut dough in said spaces while retained therein by said support.

18. In combination, a rotary cutter having ribs outlining cutting-spaces thereon, an opposing agent against which said cutter may act in cutting dough to become lodged in said spaces, air-passages communicating with the spaces behind the dough therein, means for exhausting the air beneath the dough in said spaces, and means for subsequently ejecting the dough from said spaces.

19. In combination, a rotary cutter provided with ribs outlining cutting-spaces thereon, an opposing agent against which the cutter may act in cutting dough to be lodged in said spaces, air-passages in the cutter leading to the spaces behind the dough, and valvular means for admitting the air-supply to different spaces at different points in the rotation of the cutter.

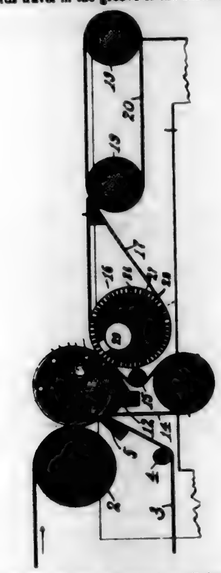
705,041. **CRACKER-MACHINE.** ALEXANDER W. COPLAND, Cambridge, Mass. Filed Oct. 31, 1901. Serial No. 80,598. (No model.)

Claim.—1. In combination a cylinder with cutting-rib outlining spaces thereon; an apron in circumferential wrapping contact therewith; and means to give a sharp turn to the apron at one limit of such circumferential contact.

2. In combination a cylinder with cutting-rib outlining spaces thereon; an apron in circumferential wrapping contact therewith; and means to give sharp turns to the apron at both limits of such circumferential contact.

3. In combination a cylinder with cutting-ribs outlining spaces thereon; a suction stripping-roll running in contact with said cylinder, and a cord-carrier the cords of which travel about the suction stripping-roll between it and said cylinder.

4. In combination a cylinder with cutting-rib outlining spaces thereon; a suction stripping-roll having circumferential grooves; and a cord-carrier whose cords travel in the groove of the suction stripping-roll.



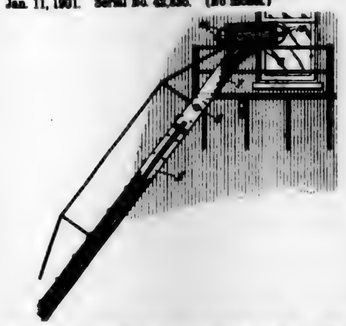
5. In combination a suction stripping-roll having circumferential grooves; a plurality of endless cords in those grooves; and a forward support for the cords about which they make a sharp turn.

6. In combination a cylinder with cutting-rib outlining spaces thereon, and with radial cylinders; pistons in the radial cylinders; to act as strippers; and means to admit compressed air to the inner ends of the radial cylinders.

7. In combination a cylinder with cutting-rib outlining spaces thereon; a traveling surface to feed the dough to that cylinder; means acting from within the cylinder to strip the cut dough from the spaces; and external suction stripping means acting in conjunction with the internal stripping means.

8. In combination, a rotary cutter provided with ribs outlining cutting-spaces thereon and provided with radial cylinders extending inwardly from said spaces, pistons in said cylinders, and means for moving said pistons outwardly to eject the dough from said spaces.

705,042. **FIRE-ESCAPE.** JOHN T. COWLES, Chicago, Ill. Filed Jan. 11, 1901. Serial No. 42,836. (No model.)



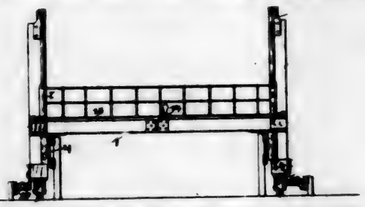
Claim.—1. A movable step or ladder having a pivotal support, means for holding up the free end of said movable step applied at one side thereof, a device for aiding in the support of the other side thereof, and mechanism coöperating with said last-mentioned supporting device for securing the same to that side of the ladder which is opposite the one which is to be supported by it, whereby the inner free end of the ladder is carried from the outer side, substantially as described.

2. A movable step or ladder provided with a pivotal support, means comprising an adjustable counterbalance for holding up the free end of said movable ladder applied at one side only thereof, a supporting device for the other side thereof secured to said counterbalanced side, by means, substantially as described, whereby the side opposite the counterbalanced side may be brought up, when the ladder stands in horizontal position, to the proper level, substantially as set forth.

3. A movable step or ladder carried by a pivotal support, a counterweight applied at one side only of said step, means for supporting the other side thereof, comprising a rod subject to torsional strain and arranged to extend longitudinally alongside of the counterweighted side of the step and inwardly to the opposite side near the bottom of the step, substantially as described.

4. A movable step or ladder carried upon a pivotal support, one side of said step being projected or extended beyond said pivotal support to form a counterbalance-arm, and provided with an automatically-shifting counterweight device, comprising a cylinder attached to said arm, a ball within said cylinder, means for retaining said ball within said cylinder, said cylinder being attached in a position such that when said step is in operative position the ball may roll toward the point of pivotal support, and when the step is partly raised the ball may roll away from the point of pivotal support, a device for aiding in the support of the unounterbalanced side of the step, and mechanism coöperating with said last-mentioned device for securing the same to that side of the ladder which is opposite the one which is to be supported by it, substantially as described.

705,043. **RACE-STARTING MACHINE.** CHARLES W. CROWLEY, St. Louis, Mo. Filed July 22, 1901. Serial No. 69,353. (No model.)



Claim.—1. A machine for starting race-horses, consisting of suitable frames mounted outside the fences at the sides of the track, an inclined front barrier, devices for steadying the frames when the barrier is released and guides outside the frames for holding them against the fences, substantially as specified.

2. In a machine for starting race-horses, having an inclined barrier, extending across the track, frames for supporting said barriers and operating outside the fences at the sides of the track, guides for holding the frames against the fences, suitable devices carried by said frames for operating against the fences to reduce the resistance, and means for moving the front barrier to permit the horses to pass out of the machine, substantially as specified.

3. A machine for starting race-horses, consisting of suitable barriers, side frames for supporting them, which frames are adapted to operate outside the fences at the sides of the track, rollers carried by said frames and operating against the frames, suitable guides mounted outside the said frames to hold them against the fences and connections between the said frames and the guides, substantially as specified.

4. A machine for starting race-horses, consisting of suitable barriers, side frames for supporting them, which frames are mounted outside the fences at the sides of the track, rollers carried by said frames and operating against the fences, and guide-strips outside the frames for holding them against the fences, rollers carried by the said frames and operating against the guide-strips, guide-ropes mounted outside the side frames, and connections between the said frames and the guide-ropes, whereby the machine will be steadied, substantially as specified.

705,044. **HYDROCARBON INCANDESCENT LAMP.** PHILIP B. CURRAN, Philadelphia, Pa., assignor to Kitsee Hydrocarbon Heating and Incandescent Lighting Company, a Corporation of West Virginia. Filed July 23, 1900. Serial No. 24,519. (No model.)

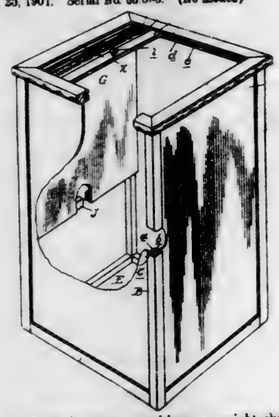
Claim.—1. The combination of a vaporizer having a jet and a peripherally-flanged member 25, a mixing-chamber arranged above said flanged member, the base of such chamber being secured to the flange and defining a separate chamber or reservoir 37, means for supplying air to the mixing-chamber, a burner-tube, and an inner-lying tube having its end partially closed to constitute a baffle for deflecting a portion of the gaseous fuel toward the reservoir, means providing a communication from the

reservoir to the interior of the burner-tube, as described, and an auxiliary heater arranged below and communicating with the reservoir

2. The combination of a vaporizer having a jet and a peripherally-flanged member 25, a mixing-chamber arranged above said flanged member the base of such chamber being secured to the flange and defining a separate chamber or reservoir 37, air-tubes for supplying air to the mixing-chamber, a burner-tube, and an inner-lying tube having its end partially closed to constitute a baffle for deflecting a portion of the gaseous fuel toward the reservoir, a plurality of tubes 34 penetrating the mixing-chamber and designed to convey the deflected fuel to the reservoir, and an auxiliary heater arranged below and communicating with said reservoir, substantially as described.

3. The combination of a hydrocarbon-liquid-fuel-supply pipe and a vaporizing-tube, of a coupling connecting the two, said coupling arranged for attachment to the ordinary gas-supply pipe and having a gas-space with suitable inlet and outlets, two or more Bunsen burners and a pilot-lighter connecting with the outlets and whereof the former are arranged to heat the vaporizing-tube, an auxiliary heater for the vaporizing-tube, and a baffle-plate interposed between said burners and auxiliary heater, substantially as described.

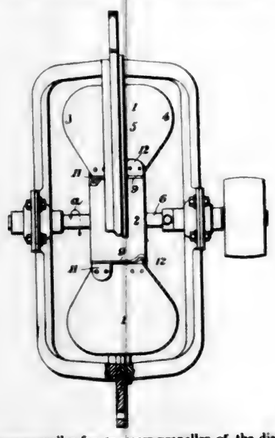
705,045. HAMPER. GEORGE M. DAVIDSON, Big Rapids, Mich. Filed Nov. 25, 1901. Serial No. 83,595. (No model.)



Claim.—A clothes-hamper, comprising an upright skeleton frame consisting of uprights, each provided with grooves *a* and *b*, and cross-bars connecting the lower ends of the uprights, a bottom member secured to the cross-rails and side members engaging the grooves within the uprights, a rectangular frame forming the hamper-top mounted upon the upper ends of said uprights and having the grooves or ways *c* formed in the inner faces of two of its opposite sides, a single plate or panel secured upon the inner faces of two of the uprights forming in connection with the adjoining side section a vertical pocket at one of the hamper sides intermediate of the ways in the top, convex guide-blocks at each side of the panel interposed between the upper edge of the latter and the grooved members of the rectangular frame, a flexible roll-cover within the pocket extending over the guide-blocks and adapted to travel within the ways in the hamper-top, and a horizontal bar interposed between the lower portion of the panel and the adjoining side section, adapted to limit the inward movement of the cover.

705,046. ROTARY PROPELLER-FAN AND PROPELLER FOR SHIPS. SAMUEL C. DAVIDSON, Belfast, Ireland. Filed Apr. 6, 1901. Serial No. 54,651. (No model.)

Claim.—1. A rotary propeller-fan or screw-propeller of the disclosed type, in which the intake and discharge edge portions of each blade are formed as oppositely-dished surfaces, from approximately the central part of the peripheral edge of the blade around the margin thereof toward the hub or axle, in such manner that the advancing surface of the blade is, at the intake edge portion, substantially concave, and at the discharge edge portion substantially convex, substantially as hereinbefore described.



2. A rotary propeller-fan or screw-propeller of the disclosed type, in which the intake and discharge edges of each blade are formed as oppositely-dished surfaces, from approximately the central part of the peripheral edge of the blade around the margin thereof toward the hub or axle, the intervening central part of the blade having approximately a plane surface and the dished edge portions inclined toward it in directions approximately perpendicular to the edges of the blade, whereby the intake edge portion of each blade has a converging or focusing action on the fluid operated upon, from the intake edge toward the center of the blade, and the discharge edge portion thereof has a divergent or diffusive action thereon, from said center to its discharging edge, substantially as set forth.

3. A rotary propeller-fan or screw-propeller of the disclosed type, in which the intake and discharge edge portions of each blade are formed as oppositely-dished surfaces, from approximately the central part of the peripheral edge of the blade around the margin thereof toward the hub or axle, in such manner that the advancing surface of the blade is, at the intake edge portion, substantially concave, and at the discharge edge portion substantially convex, with the intervening central portion of the blade having an approximately plane surface, and the blades arranged with their central portions inclined to the plane of revolution, substantially as set forth.

4. A rotary propeller-fan or screw-propeller of the disclosed type, in which the intake and discharge edge portions of each blade are formed as oppositely-dished surfaces, from approximately the central part of the peripheral edge of the blade around the margin thereof toward the hub or axle, in such manner that the advancing surface of the blade is, at the intake edge portion, substantially concave, and at the discharge edge portion substantially convex, and said dished portions merging gradually into the intermediate central portion of the blade, their surfaces on lines radiating approximately from the center of the blade being curved so that the intake and discharge edge portions of the blade are of concavo-convex form or approximately spoon-shaped, substantially as set forth.

5. A rotary propeller-fan or screw-propeller of the disclosed type, in which the intake and discharge edge portions of each blade are formed as oppositely-dished surfaces, from approximately the central part of the peripheral edge of the blade around the margin thereof toward the hub or axle, in such manner that the advancing surface of the blade is, at the intake edge portion, substantially concave, and at the discharge edge portion substantially convex, and with the intervening central portion of the blade formed with an approximately plane surface, the blades being mounted in screw form around the hub with their intake and discharge edge portions directed at obtuse and substantially equal angles to the plane of revolution, whereby they will operate with approximately equal efficiency in either direction of revolution, substantially as set forth.

6. In screw-propellers and rotary propeller-fans, a hub formed as a cylinder upon which the blades are arranged diagonally, and a series of plates mounted upon said hub each having lugs projecting radially from it upon which the blades are mounted and are held by their inner ends at any required angular pitch or inclination to the plane of the fan's revolution, substantially as set forth.

7. In screw-propellers and rotary propeller-fans, the combination with a hub, and blades arranged diagonally on said hub, of blade-holders each consisting of a plate which is shaped to fit evenly upon a portion of the circumferential face of the hub, with lugs projecting radially therefrom, upon which each of the blades is mounted and is held by its inner end accurately at the required angular pitch or inclination to the plane of the fan's revolution, substantially as set forth.

705,047. PUMP. PHILIP H. DEER, Washington, D. C. Filed Apr. 5, 1902. Serial No. 101,455. (No model.)

Claim.—1. In a pump, the combination, with the main conducting-pipe for the liquid to be elevated and with reciprocating liquid-elevating means in said pipe, of a fluid-containing receptacle, a buoyant body normally sustained elevated by the fluid in said receptacle and connected with the liquid-elevating means for movement therewith, a pendulum, and operative connecting means between the pendulum and the liquid-elevating means, substantially as described.

2. In a pump, the combination, with the main conducting-pipe for the liquid to be elevated and with reciprocating liquid-elevating means in said pipe, of a fluid-containing receptacle, a buoyant body normally sustained elevated by the fluid in said receptacle, and a pendulum, said pendulum, said liquid-elevating means and the buoyant body being operatively connected together, substantially as described.

3. In a pump, the combination, with the main conducting-pipe for the liquid to be elevated and with reciprocating liquid-elevating means in said pipe, of a fluid-containing receptacle penetrated vertically by said pipe, a buoyant body surrounding said pipe and normally sustained elevated by the fluid in said receptacle, and a pendulum, said pendulum, the liquid-elevating means and the buoyant body being operatively connected together, substantially as described.

4. In a pump, the combination with the main conducting-pipe for the fluid to be elevated and with reciprocating liquid-elevating means in said pipe, of a fluid-containing receptacle having an opening in its bottom wall, said pipe extending vertically through said opening, a guiding-sleeve secured to the bottom of said receptacle about the opening and receiving said pipe, an annular float surrounding said sleeve and normally sustained elevated by the fluid in said receptacle, and a pendulum, said pendulum, the liquid-elevating means and the float being operatively connected together, substantially as described.

5. In a pump, the combination, with the main conducting-pipe for the liquid to be elevated and with reciprocating liquid-elevating means in said pipe, of a fluid-containing receptacle, a buoyant body normally sustained elevated by the fluid in said receptacle, a pendulum, said pendulum, said liquid-elevating means and the buoyant body being operatively connected together, and means for imparting periodic impulses to the pendulum, substantially as described.

6. In a pump, the combination, with the main conducting-pipe for the liquid to be elevated and with reciprocating liquid-elevating means in said pipe, of a fluid-containing receptacle, a buoyant body normally sustained elevated by the fluid in said receptacle, a pendulum, said pendulum, said liquid-elevating means and the buoyant body being operatively connected together, and electromagnetic means for imparting periodic impulses to the pendulum, substantially as described.

7. In a pump, the combination of the main conducting-pipe for the liquid to be elevated, liquid-elevating means in said pipe, a pendulum, operative connecting means between the pendulum and the liquid-elevating means, and electromagnetic means for imparting periodic impulses to the pendulum and comprising electrically-interconnected electromagnets, contact-points arranged in duplicate and electrically connected each with a magnet, a battery, a pivoted circuit maker and breaker adapted to be actuated by either of said magnets at a time and to engage either of said contact-points at a time, conductors connecting the battery with the said circuit maker and breaker and the battery with the electromagnets, armatures adapted to be attracted by said magnets and to move said circuit maker and breaker out of engagement with the adjacent contact-points, and operative connecting means between the pendulum and said armatures, substantially as described.

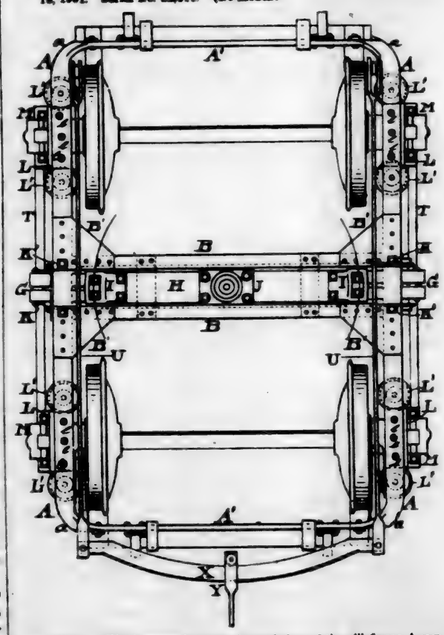
705,048. BUILDING-WALL. ALPHONSE DE MAS, New York, N. Y. Filed June 5, 1901. Serial No. 63,237. (No model.)

Claim.—1. A building-wall comprising a structural framework composed of vertical and horizontal connecting metallic beams leaving open panels between, small tension members extending across said open panel upon opposite sides of said framework and overlapping the latter and a cementitious filling embedding said structural and cross tension members.

2. A building-wall comprising a metallic structural framework composed of vertical columns and horizontal connecting-beams leaving open panels therebetween, a series of small metallic tension members extending across said open spaces on the outside of said framework and overlapping said vertical columns, a similar series of metallic tension members arranged in a different plane from the first series of tension members and overlapping said horizontal beams and a cementitious body filling said panel and embedding said tension members, said body being extended around said vertical columns and horizontal beams to embed these also.

3. A building-wall comprising a metallic structural framework forming open panels between the members thereof, small metallic tension members extending across said open panels at the side of said framework and overlapping the latter, a cementitious body filling said open panel and embedding said metallic tension members, and structural framework; coating of waterproof material outside of said cementitious filling and a facing of finishing material outside of said waterproof coating.

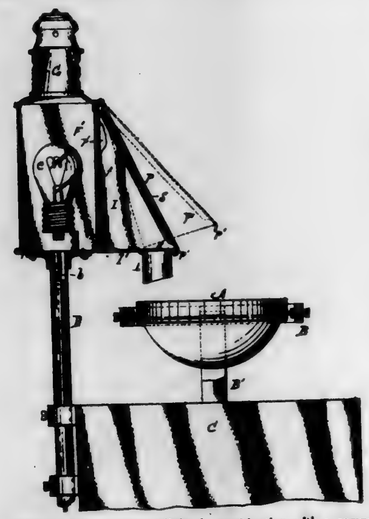
705,049. CAR-TRUCK. HENRY A. DORNER, Logansport, Ind., assignor to the Dorner Truck & Foundry Co., Logansport, Ind. Filed Nov. 18, 1901. Serial No. 82,811. (No model.)



Claim.—The improved car-truck consisting of the sill-frame A consisting of a continuous flat bar having rounded corners and perpendicular

end bars A', in combination with the angle-piece cross-bars B B and plates B'' B'' secured to said cross-bars B B, the gusset-plates B' B' secured to the frame-bars A A and cross-bars B B, the brackets C C secured to the cross-bars B B and the gusset-plates B' B' and plates B'' B'', the arch brace-bars K K extending between the pedestals; the tubular projections C' on the brackets C C, bolts K' through the plates B' frame A, tubular projections and the arch-bars K, binding them together, the blocks E E supported on the arch-bars K K, the links D D suspended from the brackets C C by the bolts *d d*, and connected to the blocks E E by the bolts *e e*, and the lower cross-bar F supported on the blocks E E, the springs G G supported on the cross-bar F, and the bolster H supported on the springs G G, constructed and combined substantially as described.

705,050. COMPASS-LIGHT. OSCAR B. EATON, Boston, and FRANK C. BURRILL, Hull, Mass. Filed Feb. 20, 1902. Serial No. 94,908. (No model.)

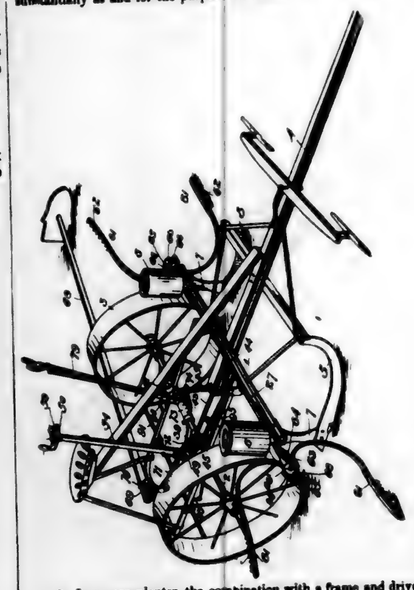


Claim.—1. In a compass-light, in combination with a compass; a lantern comprising a case and a cover swinging therefrom and adapted to close or open an opening sufficiently large to allow the light to illuminate the entire compass, said lantern being provided with a smaller aperture adapted to allow a small portion only of the compass to be illuminated, the lantern being so set with relation to the compass as to allow the light to be constantly shed thereon through the small aperture, substantially as set forth.

2. In a compass-light, in combination with a compass; a lantern comprising a case and a cover swinging therefrom and adapted to open or close an aperture large enough to allow the light to illuminate the entire compass, said lantern being provided with a smaller aperture adapted to allow only a limited portion of the compass to be illuminated; and a tube extending down from said aperture whereby the light is guided and confined to a limited portion of the surface of the compass, substantially as described.

705,051. CORN-PLANTER. DAVID ELEY, Lakefork, Ohio. Filed Apr. 12, 1901. Serial No. 56,391. (No model.)

Claim.—1. In a corn-planter, the combination with a hopper and a feed-chute below the hopper; of a hopper-bottom pivoted to the feed-chute and adapted to be tilted to expose the feed mechanism, said hopper-bottom being provided with an opening for the discharge of the seed, a shaft carrying a driving-gear and a knocker-block, a supporting-plate mounted upon the feed-chute and provided with a feed-hole, a rotary feed-plate mounted between the bottom of the hopper and the supporting-plate and provided with feed-holes and with a central opening having communicating notches, a coupling-plate fitted in said opening and provided with lugs or projections to engage said notches, a bolt or shaft projecting through the supporting-plate and coupling-plate, a drive-pinion having a journal fitted in the central opening in the supporting-plate and provided with projections removably engaging the coupling-plate, said pinion meshing with said driving-gear, an oscillating valve mounted in the bottom of the feed-chute and having a passage forming a pocket for the reception and discharge of the seed, a vibrating lever connected to the valve and adapted to be operated by the knocker-block to open said valve, a spring acting on the valve and lever for retracting the same to their normal positions, and controllable drive-gearing for imparting motion to the shaft, substantially as and for the purpose set forth.



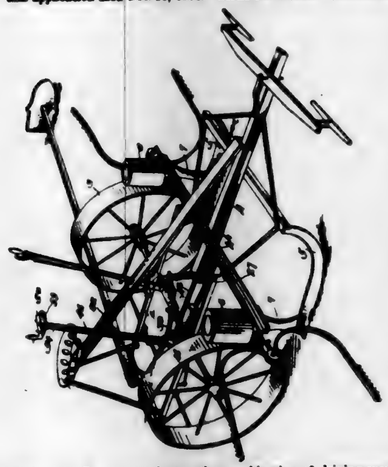
2. In a corn-planter, the combination with a frame and drive-shaft, of a feed hopper and chute, a rotary feed-disk within the hopper for controlling the passage of seed from the hopper to the chute, a shaft in gear with said feed-plate for operating the same, and means for communicating motion from the drive-shaft to the feed-disk-operating shaft, the same comprising a sleeve fixed to the drive-shaft and carrying revoluble bevel-pinions, a bevel gear-wheel loosely mounted upon the drive-shaft upon one side of said sleeve, connections between said bevel gear-wheel and the feed-disk-operating shaft, a double-bevel gear-wheel loosely mounted upon the drive-shaft upon the opposite side of said sleeve, and means for moving said double gear-wheel into engagement with the bevel-pinions, substantially as described.

3. In a corn-planter, the combination with a frame and drive-shaft, of a feed hopper and chute, a rotary feed-disk within the hopper for controlling the passage of seed from the hopper to the chute, a shaft in gear with said feed-plate for operating the same, means for communicating motion from the drive-shaft to the feed-disk-operating shaft, the same comprising a sleeve fixed to the drive-shaft and carrying revoluble bevel-pinions, a loose bevel gear-wheel mounted upon the drive-shaft upon one side of said pinions, gearing between said loose gear-wheel and the operating-shaft for the feed-disk, a double-bevel gear-wheel loose upon the drive-shaft upon the other side of said pinions, a controlling-rod vertically movable and provided with a bevel-pinion to engage the outer toothed face of the double-bevel gear, and means for raising and lowering said controlling-rod to bring the bevel-pinion thereon into and out of engagement with said double-bevel gear, substantially as described.

4. In a corn-planter, the combination with a frame and drive-shaft, of a feed hopper and chute, a rotary feed-disk within the hopper for controlling the passage of seed from the hopper to the chute, a shaft in gear with said feed-plate for operating the same, means for communicating motion from the drive-shaft to the feed-disk-operating shaft, the same comprising a sleeve fixed to the drive-shaft and carrying revoluble bevel-pinions, a loose bevel gear-wheel mounted upon the drive-shaft upon one side of said pinions, gearing between said loose gear-wheel and the operating-shaft for the feed-disk, a double-bevel gear-wheel loose upon the drive-shaft upon the other side of said pinions, a controlling-rod provided with a bevel-pinion to engage the outer toothed face of the double-bevel gear-wheel, and means for raising and lowering the controlling-rod and turning the same, substantially as described.

5. In a corn-planter, the combination with a frame and drive-shaft, of a feed hopper and chute, a rotary feed-disk within the hopper for controlling the passage of seed from the hopper to the chute, a shaft in gear with said feed-plate for operating the same, means for communicating motion from the drive-shaft to the feed-disk-operating shaft, the same comprising a sleeve fixed to the drive-shaft and carrying revoluble bevel-pinions, a loose bevel gear-wheel mounted upon the drive-shaft upon one side of said pinions, gearing between said loose gear-wheel and the operating-shaft for the feed-disk, a double-bevel gear-wheel loose upon the drive-shaft upon the other side of said pinions, a controlling-rod provided with a bevel-pinion to engage the outer toothed face of the double-bevel gear-wheel, a swinging bracket with which the controlling-rod is slidably engaged, a standard supported by the bracket, a plate connected to the standard and having an opening for the passage of the upper end of the controlling-rod and a series of teeth or notches, a lever pivoted to the upper end of the controlling-rod and adapted to bear against said plate to elevate the rod, and to be turned to rotate the rod, and means for holding the bracket fixed in adjusted position, substantially as described.

705,052. CORN-PLANTER. DAVID ELEY, Lakefork, Ohio. Original application filed Apr. 12, 1901, Serial No. 56,391. Divided and this application filed Dec. 19, 1901. Serial No. 86,546. (No model.)



Claim.—1. In a corn-planter, the combination of driving means, dropper mechanism, compensating gearing between the driving means and dropper mechanism to throw the latter into and out of action and to operate the same at different rates of speed, and means for controlling said compensating gearing, substantially as described.

2. In a corn-planter, the combination of a drive-shaft, a driven shaft, dropper mechanism operated by the driven shaft, compensating gearing between the shafts and adjustable to stop the operation of the driven shaft and to drive said shaft at different rates of speed, and means for adjusting said compensating gearing, substantially as described.

3. In a corn-planter, the combination of a drive-shaft, a driven shaft, dropper mechanism operated by the driven shaft, compensating gearing between the shafts and adjustable to stop the operation of the driven shaft and to drive said shaft at different rates of speed, markers mounted upon the driven shaft, and means for adjusting said compensating gearing, substantially as described.

4. In a corn-planter, the combination of a drive-shaft, a driven shaft, dropper mechanism operated by the driven shaft, variable-speed gearing between the shafts and adjustable to stop the operation of the driven shaft and to drive said shaft at different rates of speed, said gearing including a pair of gear members loose on the drive-shaft, an intermediate gear fixed to turn with the drive-shaft and independently revolvable, said intermediate gear being normally in engagement with one of said pair of gear members, and means for moving the other gear member into engagement with said intermediate gear and for rotating said gear member to vary the speed of the gearing, substantially as set forth.

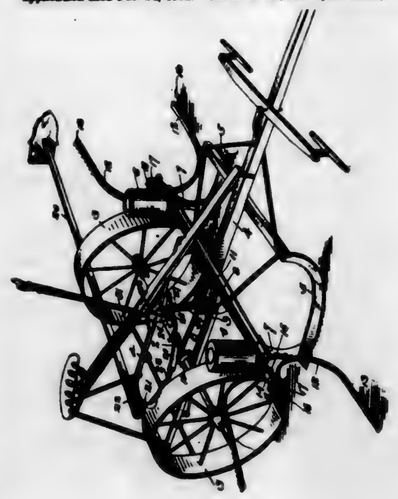
5. In a corn-planter, the combination of a drive-shaft, a driven shaft, dropper mechanism operated by the driven shaft, variable-speed gearing between the shafts and adjustable to stop the operation of the driven shaft and to drive said shaft at different rates of speed, said gearing including a pair of gear members loose on the drive-shaft, an intermediate gear fixed to turn with the drive-shaft and independently revolvable, said intermediate gear being normally in engagement with one of said pair of gear members, a shifting and driving device by which the other gear member may be shifted into engagement with said intermediate gear, and by which said gear member may also be rotated, and manually-operable means for actuating said shifting and driving device for performing the described functions, substantially as set forth.

6. In a corn-planter, the combination of a drive-shaft, a driven shaft, dropper mechanism operated by the driven shaft, variable-speed gearing between the shafts and adjustable to stop the operation of the driven shaft and to drive said shaft at different rates of speed, said gearing including a power-transmitting gear loose on the drive-shaft, a double shiftable speed-changing gear also loose on the drive-shaft, an intermediate gear normally in engagement with the power-transmitting gear, said intermediate gear being mounted to turn with the drive-shaft but independently revolvable in a plane at right angles to said shaft, a pinion for engaging one of the toothed faces of the double gear, and means for operating said pinion for shifting said double gear to bring its other toothed face into engagement with intermediate gear, and for rotating said double gear, substantially as set forth.

7. In a corn-planter, the combination of a drive-shaft, a driven shaft, dropper mechanism operated by the driven shaft, variable-speed gearing between the shafts and adjustable to stop the operation of the driven shaft and to drive said shaft at different rates of speed, said gearing including a power-transmitting gear loose on the drive-shaft, a double shiftable speed-changing gear also loose on the drive-shaft, an intermediate gear normally in engagement with the power-transmitting gear, said intermediate gear being mounted to turn with the drive-shaft but independently revolvable in a plane at right angles to said shaft, a pinion engaging one of the toothed faces of the double gear, a rod carrying the pinion, means for moving the rod vertically to move the pinion into and out of engagement with the double gear, thereby bringing said double gear into and out of engagement with the intermediate gear, and means for turning said rod for rotating the pinion and double gear, substantially as set forth.

8. In a corn-planter, the combination of a drive-shaft, a driven shaft, dropper mechanism operated by the driven shaft, variable-speed gearing between the shafts and adjustable to stop the operation of the driven shaft and to drive said shaft at different rates of speed, said gearing including a power-transmitting gear loose on the drive-shaft, a double shiftable speed-changing gear also loose on the drive-shaft, an intermediate gear normally in engagement with the power-transmitting gear, said intermediate gear being mounted to turn with the drive-shaft but independently revolvable in a plane at right angles to said shaft, a pinion 4 engaging one of the toothed faces of the double gear, a rod carrying the pinion, means for moving the rod vertically to move the pinion into and out of engagement with the double gear, thereby bringing said double gear into and out of engagement with the intermediate gear, means for turning said rod for rotating the pinion and double gear, and means for positively locking the rod in adjusted position, substantially as set forth.

705,053. CORN-PLANTER. DAVID ELEY, Lakefork, Ohio. Original application filed Apr. 12, 1901, Serial No. 56,391. Divided and this application filed Feb. 24, 1902. Serial No. 95,333. (No model.)



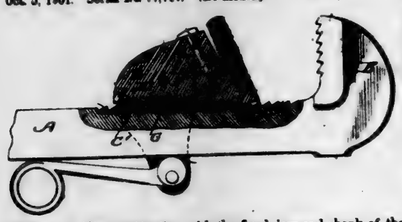
Claim.—1. In a corn-planter, markers coaxially arranged in pairs on opposite sides of the planter-frame, and means for adjusting the markers of each pair on their axes toward or away from each other to strike the ground with greater or less force, substantially as described.

2. In a corn-planter, the combination with the frame; of markers comprising curved spring-metal bars carrying marking devices at their free ends and adjustably connected at their inner ends to be moved toward and away from each other to strike the ground with greater or less force, substantially as described.

3. In a corn-planter, the combination with the frame and a shaft mounted transversely upon the frame, of markers mounted in pairs upon each end of the shaft, said markers comprising curved spring-metal bars provided at their inner ends with corrugated or serrated disks, a double corrugated or serrated disk upon the shaft end to engage the same, and means for connecting said disks to permit them to be adjusted to move the markers of each pair toward or away from each other to strike the ground with greater or less force, substantially as described.

4. In a corn-planter the combination with a frame having shoes, and a tongue adjustable vertically to regulate the depth of penetration of said shoes; of a guide and connecting piece upon the rear end of the tongue, a bar adapted to project laterally from the frame, a gage-runner carried by said bar for gaging the distance between rows, a double crank-shaft mounted upon the frame and to one of the arms of which the bar is connected, an oscillatory sleeve having front and rear arms, a flexible connection between the rear arm of the sleeve and other arm of the crank-shaft, the said front arm of the sleeve having a sliding engagement with said guide and connecting piece on the tongue, a coil-spring surrounding the guide and connecting piece and adapted to be compressed by the sliding sleeve-arm to force the shoes deeper into the soil, a lever for adjusting the sleeve, and means for locking the lever in adjusted position, substantially as and for the purpose set forth.

705,054. PIPE-WRENCH. WILLIAM H. EMERSON, Cambridge, Ohio, assignor of one-half to Thomas Minto, Cambridge, Ohio. Filed Oct. 5, 1901. Serial No. 77,717. (No model.)



Claim.—1. The combination with the fixed jaw and shank of the movable head having a transverse groove, a rocking jaw having a rib adapted to fit in the said groove and means for locking the rocking jaw and head and means for locking the movable head and shank, substantially as described.

2. The combination with the fixed jaw and shank, of the movable head and means for locking the same, the forward end of the said head being cut away and grooved transversely a gripping-jaw adapted to fit into the cut-away portion and provided with a transverse rib having a central notch and a pin passing down through the head and engaging said notch to lock the rib in the groove, substantially as shown and described.

705,055. BRUSH-HOLDER. HERMANN F. T. ERBEN, Schenectady, N. Y., assignor to General Electric Company, a Corporation of New York. Filed Dec. 20, 1900. Serial No. 40,512. (No model.)

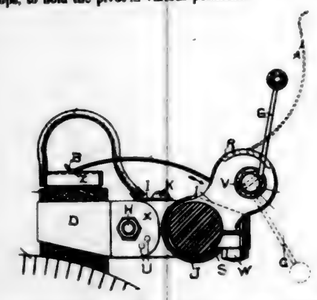
Claim.—1. The combination with a holder, of a curved resilient arm, one end of which bears on the brush, and a pivot by which the other end of the arm is supported, and about which a portion of the arm is coiled in an inverse direction to said curve.

2. The combination with a holder, of a resilient arm, one end of which bears on the brush, and a bifurcated rotatable pivot to which the other end of the arm is fixed, whereby the arm can be revolved to permit the removal of the brush.

3. The combination with a holder, of a curved resilient arm, one end of which bears on the brush, and a rotatable pivot to which the other end of the arm is fixed, and about which a portion of the arm is coiled in an inverse direction to said curve.

4. The combination with a holder, of a resilient arm, one end of which bears on the brush, a bifurcated rotatable pivot to which the other end of the arm is fixed, and means for holding the pivot in various positions to vary the tension of the resilient arm.

5. The combination with a holder, of a curved resilient arm, one end of which bears on the brush, a rotatable pivot about which the other end of the arm is coiled in an inverse direction to said curve, suitable stops in the holder, and a device connected with the pivot which engages the stops, to hold the pivot in various positions.



6. The combination with a holder, of a curved resilient arm, one end of which bears on the brush, and the other end of which is coiled in an inverse direction to said curve, a rotatable pivot which supports said coiled end of the arm, and means for holding the pivot in various positions.

7. The combination with a holder, of a resilient arm, one end of which bears on the top of the brush, and the other end of which is coiled, and a rotatable pivot which supports said coiled end, the arm having a curve intermediate its ends, whereby in all operative positions of the pivot and all positions of the brush, the free end of the arm bears always on the same portion of the top of the brush.

8. The combination with a holder, of a resilient arm, one end of which bears on the top of the brush, a suitable support for the other end of the arm, said arm intermediate its ends being curved, whereby the free end of the arm bears always upon the same portion of the top of the brush.

9. The combination with a holder, of a resilient arm, one end of which bears on the top of the brush, and the other end of which is coiled, a rotatable pivot which supports said coiled end of the arm, said arm being curved intermediate its ends so that when the pivot is rotated to tighten the coil, the curve of the arm is flattened, while the free end remains in contact with the same part of the top of the brush.

10. The combination with a holder, of a resilient arm, one end of which is suitably supported, and the other end of which bears always on the same portion of the top of the brush.

11. The combination with a holder, of a resilient arm, one end of which bears on the top of the brush, and means for varying the tension of said arm, the arm being curved whereby it always bears on the same part of the brush.

705,056. TONGUE-SWITCH. GEORGE M. ERVIN, Johnstown, Pa., assignor to the Lorain Steel Company, a Corporation of Pennsylvania. Filed Nov. 13, 1901. Serial No. 82,104. (No model.)

Claim.—1. In a tongue-switch, the combination with the continuous-rail member having a portion of its head removed, and the casting to which said rail member is secured, of a wear member forming a bed for the point end of the movable tongue and also having a portion which replaces the removed head of the rail member.

2. In a tongue-switch, the combination with the continuous-rail member, having a portion of its head removed, and the casting to which said rail is secured, and which is formed with a side flange opposite the rail member, of a wear member seated between the rail and the said flange and having a portion which replaces the removed portion of the rail-head, together with means for removably securing said rail member to its seat.

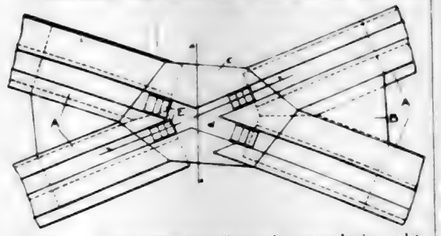
3. In a tongue-switch, the combination with the continuous rail, having a portion of its head removed, and the casting to which said rail is secured, and which is formed with a side flange, of the box-like wear member seated and secured between said flange and the web of the rail, the latter being bent inwardly to provide an overhanging side bearing for the wear member.

4. In a tongue-switch, the combination with the continuous curved rail having a portion of its head removed, and the casting to which said rail is secured, said casting having an under beveled side flange C', of the wear member D seated between said flange and the web of the rail, and having a portion replacing the removed head of said rail, and the removable keys or wedges which secure said member D to its seat.

5. In a tongue-switch, a rail member seated in the switch structure and having a depressed portion forming a bed for the movable switch-point, and a raised portion fitting over the web of the through-rail and replacing a portion of the head thereof, together with removable keys or wedges which secure said member in its seat.

6. In a tongue-switch, the combination of the through-rail, having a portion of its head removed, the casting to which said rail is secured having a side flange, the wear member seated between said flange and the web of the rail and forming a bed for the movable switch-tongue, said member also having a raised portion replacing the removed head of the rail, spelter or like material underneath and at the sides of said member, and removable fastening keys or wedges securing said member in its seat.

705,057. RAILWAY-TRACK STRUCTURE. GEORGE M. ERVIN, Johnstown, Pa., assignor to the Lorain Steel Company, a Corporation of Pennsylvania. Filed Nov. 13, 1901. Serial No. 82,103. (No model.)



Claim.—1. The combination with a track structure having a plate seat or pocket, and a plate seated in the same, of one or more fastening devices or holding-down members extending through said plate and having a holding-down engagement with the plate and the body portion of the structure, together with means for effecting and releasing such engagement from the top of the structure, by lateral movement of said devices or members.

2. The combination in a track structure, of a body portion having a pocket or recess therein, a plate seated in said pocket or recess, and one or more holding-down members extending through said plate and having a holding-down engagement with the plate and the body portion of the structure, and a downwardly-seating wedge which secures said member or members in such engagement.

3. In a track structure, the combination with a body portion having a pocket or seat therein, a plate in said pocket or seat, said body portion and plate having registering apertures therein, one or more fastening members seated in said apertures, and having offset end portions engaging the walls of the same, and laterally-acting means for holding said member or members in such engagement.

4. In a track structure, the combination with a body portion having a seat or pocket therein formed with an aperture through its bottom, a plate in said seat or pocket having an aperture registering with that of said body portion, a fastening member extending through the said apertures and having headed ends engaging offset walls thereof, and a laterally-acting wedge for securing the member in engaging position.

5. In a track structure, the combination of a body portion to which the rail members are attached or secured, a wear-plate seated in a pocket or recess of said body portion, the body portion and plate formed with registering apertures therethrough having portions of their walls inclined or beveled, a pair of fastening members seated in each of said apertures and having headed portions engaging said beveled walls, and a removable wedge driven between the said members.

6. In a track structure, the combination with a body portion, and a wear-plate seated therein, of a fastening member seated in registering apertures of the body portion and plate, and a wedge removably driven in said aperture and securing said member.

7. In a track structure, the combination with a body portion, and a wear-plate seated therein, of a fastening member or members seated in registering apertures of said body and plate and having a holding-down engagement with the walls of said apertures, and a wedge seated in said apertures and securing the said members, and adapted to be freed by driving it through to the bottom of the structure.

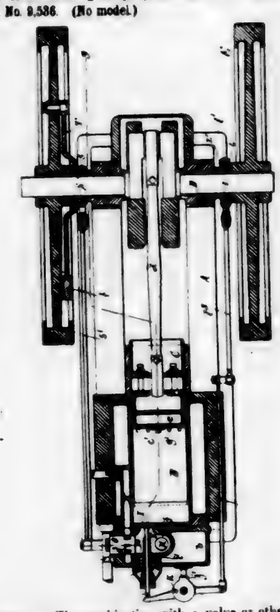
8. In a track structure, the combination with a body portion, and a wear-plate seated therein, of fastening members seated in apertures of said body portion and plate, and a wedge seated against said member or members in said aperture, said member or members being arranged to free said wedge after it has been driven beyond a certain point.

9. In a track structure, the combination with a body portion, having a pocket or recess therein open at its sides, and a plate in said pocket or recess, of one or more fastening members which engage the said body portion through the plate and hold the same to its seat, and means for effecting and releasing such engagement from the top of the structure, by lateral movement of said members.

10. In a track structure, the combination with a body portion and a wear-plate seated therein, of one or more fastening members F seated in registering apertures and of said body portion and plate and engaging the same in the manner described, and the laterally-acting removable securing wedge or wedges H.

11. In a track structure, having a wear-plate seated therein, of means for holding said plate to its seat, comprising headed keys engaging registering apertures in said body portion and plate, and wedges securing said keys and capable of being seated and unseated from the top of the structure.

705,058. OPERATING MECHANISM FOR GAS-ENGINE VALVES, &c. JESS B. FENNER, Buffalo, N. Y., assignor to the J. W. Ruger Manufacturing Company, Buffalo, N. Y. Filed Mar. 21, 1900. Serial No. 9,536. (No model.)



Claim.—1. The combination with a valve or other part to be actuated, of a rock-lever having an actuated section which is adapted to be connected with an actuating mechanism and a shifting section adapted to operate said valve, means whereby said sections are caused to move in unison while the shifting section is disengaged from the valve, and a stop device which causes the shifting section to move slower than the actuated section while the shifting section is in engagement with the valve, substantially as set forth.

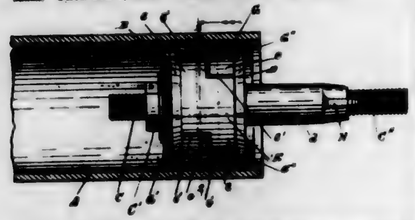
2. In a gas-engine, the combination with the cylinder, the piston and the crank-shaft connected with the piston, of a valve which controls a port of the cylinder, an outer rock-arm which is actuated from the crank-shaft, an inner rock-arm which operates said valve and which is coupled with the outer arm, so as to move in unison with the same when free, and a stationary stop which is engaged by the inner arm and which causes the same to move slower than the outer arm, substantially as set forth.

3. In a gas-engine, the combination with the cylinder, the piston, and the crank-shaft connected with the piston, of a valve which controls a port of the cylinder, an outer rock-arm which is actuated from the crank-shaft and which is provided with an eccentric, an inner rock-arm which operates said valve and which embraces said eccentric, and a stationary stop which is engaged by the inner arm and whereby the same is caused to move slower than the outer arm, substantially as set forth.

4. In a gas-engine, the combination with the cylinder the piston and the crank-shaft connected with the piston, of a valve which controls

a part of the cylinder, an outer rock-arm which is actuated from the crank-shaft and provided with an eccentric, an inner rock-arm which operates said valve and which is provided with an eccentric-jaw embracing said eccentric, a stationary stop arranged in a slot in the inner arm, and cooperating shoulders arranged on the outer arm and the eccentric-jaw, substantially as set forth.

705,059. PLUMBER'S TESTING-PLUG. JOSEPH FLYNN, Boston, Mass. Filed Oct. 1, 1901. Serial No. 77,208. (No model.)



Claim.—The herein-described plumber's testing-plug, consisting in combination, an expansive rubber cylinder G, having in one end a closed portion G', and an annular lip G'', in its opposite end, and an expanding device arranged within said rubber cylinder consisting of a tapering disk B, a spindle C, and rubber cylinder G, a longitudinally-adjustable tapering disk D, a series of interlocking duplex tapering segmental plates E, E, E, E, and means for expanding the latter and the rubber cylinder so as to force the said rubber cylinder against the interior of the pipe to be tested, substantially as and for the purpose set forth.

705,060. PIPE-WRENCH. JAMES T. FORD, San Francisco, Cal. Filed Dec. 19, 1901. Serial No. 86,847. (No model.)

Claim.—1. The combination with a handle, of a jaw having a sliding engagement therewith in a direction diagonally to the length of the handle and formed with a bail extension, a jaw mounted to slide longitudinally with respect to the handle and adapted to coact with the first-named jaw and provided with ratchet-teeth, and a spring-actuated lever pivoted to said handle and having teeth to engage the ratchet-teeth, substantially as set forth.

2. The combination with a wrench-handle formed with inclined side lips at its outer end, of a jaw formed with a bail extension and with guide-flanges to engage said lips, whereby it is capable of moving diagonally with respect to the length of the handle, a second jaw formed with a shank which extends through the bail extension and is provided with teeth on its upper edge, and a spring-actuated bail-shaped lever pivoted to said handle and provided with teeth to engage the teeth of the shank, substantially as set forth.

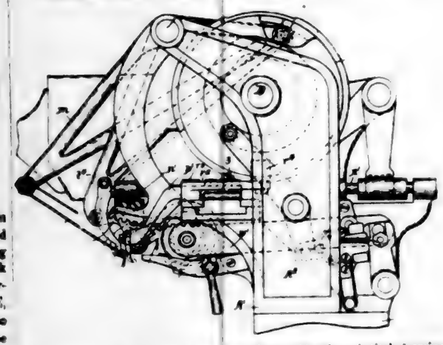
705,061. WAGON-BRAKE. CHARLES A. FRENCH, South Bend, Ind. Filed Mar. 10, 1902. Serial No. 97,397. (No model.)

Claim.—1. In a braking mechanism for vehicles, a brake-shoe having spaced integral inclined faces located in opposed relation to the wheel being braked and adapted to form a frictional contact with the outer edges of the wheel-tire as pressure is applied, the face of the tire being free from contact with said shoe, the face of said shoe being flat and in parallelism with the face of the wheel.

2. A brake-shoe for vehicles comprising a supporting-plate having spaced integral forwardly-projecting flanges arranged at an angle to the face of said plate, said flanges being located in opposed relation to the wheel being braked, whereby a flared recess of fixed dimensions will be formed between said flanges for the reception of the wheel-tire, the face of the latter being free from contact with the shoe, the face of the said plate being flat and in parallelism with the face of the wheel-rim.

3. A brake-shoe for vehicles comprising a supporting-plate having integral forwardly-projecting flanges arranged at an angle to the face of said plate, as *a'*, whereby a flared recess of fixed dimensions will be formed between said flanges for the reception of the wheel-tire, the ends of said plate projecting beyond the flanges and being curved forwardly, to form clearers for the shoe.

705,062. FEEDING MECHANISM FOR SHOE-SEWING MACHINES. ZACHARY T. FRENCH and WILLIAM C. MEYER, Boston, Mass. Filed Nov. 23, 1899. Serial No. 737,965. (No model.)



Claim.—1. In a sewing-machine, the combination of stitch-forming mechanism including a curved needle movable about an axis, a feeding-finger and means for moving it back and forth crosswise the path of movement of said needle from a point at one side of to a point at the other side of said needle, when the needle is in a remote position, substantially as described.

2. In a sewing-machine, the combination of stitch-forming mechanism including a curved needle movable about an axis, a feeding-finger and means for moving it back and forth crosswise the path of movement of said needle from a point at one side of to a point at the other side of said needle, when said needle is in a remote position, a back gage, and means for moving said back gage toward and from said feeding-finger, substantially as described.

3. In a sewing-machine, the combination of stitch-forming mechanism including a curved needle movable about an axis, a feeding-finger adapted to enter the channel of the sole and means for moving said feeding-finger back and forth across the path of movement of said needle from a point at one side of to a point at the other side of said needle, when said needle is in a remote position, substantially as described.

4. In a sewing-machine, stitch-forming mechanism, a feeding-finger against which the work is held pressed by the action of the needle-thread take-up and means for moving it across the path of movement of the needle while the work is so held, substantially as described.

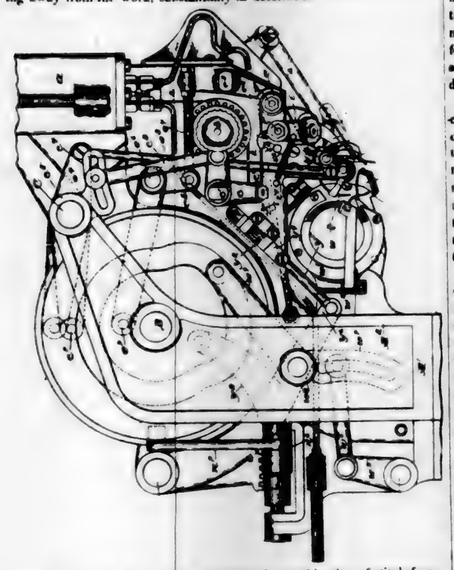
5. In a sewing-machine, stitch-forming mechanism, a feeding-finger, means for moving it back and forth across the path of movement of the needle, a needle-thread take-up operating while drawing the needle-thread taut to hold the work in engagement with said feeding-finger while said feeding-finger operates to feed along the work, a back gage cooperating with said feeding-finger, and means for moving said back gage toward and from said feeding-finger, disengaging the work while said feeding-finger operates to feed the work along, substantially as described.

705,068. SHOE-SEWING MACHINE. ZACHARY T. FRENCH and WILLIAM C. MEYER, Boston, Mass. Filed Oct. 14, 1897. Serial No. 655,105. (No model.)

Claim.—1. In a lock-stitch sewing-machine, stitch-forming mechanism including a shuttle turning on a horizontal axis and adapted to contain a bobbin, a shuttle-carrier bearing said shuttle, means for moving said shuttle-carrier in a direction at right angles to the axis of said shuttle to bodily move the shuttle and bobbin a predetermined distance away from the work and thereby draw off the bobbin a quantity of shuttle-thread for the next stitch, and to thereafter move said shuttle-carrier in the opposite direction to deliver said shuttle-thread when the next stitch is being formed, and means for holding the needle-thread taut while the shuttle-carrier is moving away from the work, substantially as described.

2. In a lock-stitch sewing-machine, stitch-forming mechanism including shuttle turning on a horizontal axis and adapted to contain a bobbin, a shuttle-carrier bearing said shuttle means for moving said shuttle-carrier in a direction at right angles to the axis of said shuttle to bodily

move the shuttle and bobbin a predetermined distance away from the work and thereby draw off the bobbin a quantity of shuttle-thread for the next stitch, and to thereafter move said shuttle-carrier in the opposite direction to deliver said shuttle-thread when the next stitch is being formed, means for varying the extent of movement of said shuttle-carrier, and means for holding the needle-thread taut while the shuttle-carrier is moving away from the work, substantially as described.



3. In a lock-stitch sewing-machine, the combination of stitch-forming mechanism including a needle, a reciprocating shuttle-carrier bearing an oscillating shuttle, means for moving said shuttle-carrier and shuttle away from the work to draw off a supply of shuttle-thread for the next stitch, an adjusting device for varying the extent of movement of said shuttle-carrier, and means for holding the needle-thread taut while the shuttle-carrier is moving away from the work, substantially as described.

4. In a lock-stitch sewing-machine, the combination of stitch-forming mechanism including a needle, a reciprocating shuttle-carrier bearing an oscillating shuttle, means for moving said shuttle-carrier and shuttle away from the work to draw off a supply of shuttle-thread for the next stitch, and means for holding the needle-thread taut while the shuttle-carrier is moved to draw off shuttle-thread, substantially as described.

5. In a lock-stitch sewing-machine, the combination of stitch-forming mechanism including a needle and a shuttle, a thread-clamp for positively clamping and thereby locking the needle-thread at a predetermined time, and means for moving the shuttle-carrier and shuttle away from the work to draw off a supply of shuttle-thread for the next stitch while the needle-thread is locked by said thread-clamp, substantially as described.

6. In a lock-stitch sewing-machine, the combination of stitch-forming mechanism including an oscillating shuttle containing a bobbin, a reciprocating shuttle-carrier bearing said oscillating shuttle, means including a thread-clamp for holding the needle-thread taut, and means for operating said shuttle-carrier to bodily move the shuttle and bobbin and thereby draw off the bobbin a quantity of shuttle-thread while the needle-thread is held taut, substantially as described.

7. In a lock-stitch sewing-machine, the combination of stitch-forming mechanism including an oscillating shuttle containing a bobbin, a reciprocating shuttle-carrier bearing said oscillating shuttle, means, including a thread-clamp, for holding the needle-thread taut, means for operating said shuttle-carrier to bodily move the shuttle and bobbin and thereby draw off the bobbin a quantity of shuttle-thread for the next stitch while the needle-thread is held taut, and an adjusting device for varying the distance said shuttle-carrier moves, substantially as described.

8. In a lock-stitch sewing-machine, the combination of stitch-forming mechanism including an oscillating shuttle containing a bobbin, a reciprocating shuttle-carrier bearing said oscillating shuttle, means, including a thread-clamp, for holding the needle-thread taut, and means for operating said shuttle-carrier, during the time the shuttle is not performing its regular functions, to bodily move the shuttle and bobbin and thereby draw off the bobbin a quantity of shuttle-thread for the next stitch while the needle-thread is held taut, and thereafter deliver said shuttle-thread when the next stitch is being formed, substantially as described.

9. In a lock-stitch sewing-machine, the combination of stitch-forming mechanism including an oscillating shuttle containing a bobbin, a reciprocating shuttle-carrier bearing said oscillating shuttle, means, including a thread-clamp, for holding the needle-thread taut, and means for moving said shuttle-carrier away from the work to thereby bodily move the shuttle and bobbin and draw off a quantity of shuttle-thread for the next stitch while the needle-thread is held taut by said thread-clamp, and for thereafter moving said shuttle-carrier toward the work to deliver up said shuttle-thread when the next stitch is being formed, substantially as described.

10. In a lock-stitch sewing-machine, stitch-forming mechanism including a needle turning on a horizontal axis, its segment and means for operating it, and shuttle turning on a horizontal axis in parallelism with the axis of said needle, a shuttle-carrier bearing said shuttle, means for moving said shuttle-carrier from and toward the needle, in a direction at right angles to the axis of said needle, to thereby draw off a measured quantity of shuttle-thread and thereafter deliver said shuttle-thread when the next stitch is being formed, and means for holding the needle-thread taut while the shuttle-carrier is moving away from the needle, substantially as described.

11. In a lock-stitch sewing-machine, stitch-forming mechanism including a needle, its segment and means for operating it and an oscillating shuttle, a shuttle-carrier bearing said oscillating shuttle, means for moving said shuttle-carrier rearward, away from the work, to thereby provide working space for the needle-segment and to draw off a supply of shuttle-thread for the next stitch, and for moving said shuttle-carrier forward, toward the work, to deliver up said shuttle-thread and to bring the beak of the shuttle into correct position to enter the loop of needle-thread, and means for holding the needle-thread taut while the shuttle-carrier is moving away from the work, substantially as described.

12. In a lock-stitch sewing-machine, stitch-forming mechanism including a shuttle oscillating on a horizontal axis, a sliding shuttle-carrier bearing said oscillating shuttle movable in a direction at right angles to the axis of oscillation of the shuttle, means for sliding said shuttle-carrier toward and from the work, and means for oscillating the said shuttle, substantially as described.

13. In a lock-stitch sewing-machine, stitch-forming mechanism including an oscillating shuttle, a sliding shuttle-carrier bearing said oscillating shuttle, means for sliding said shuttle-carrier toward and from the work, and means for oscillating said shuttle comprising a pinion and a vibrating sector, the sliding movement of the shuttle-carrier being substantially tangential to the arc of said sector, substantially as described.

14. In a lock-stitch sewing-machine, the combination of stitch-forming mechanism, means for drawing off a quantity of needle-thread for the next stitch operated independently of the stitch-forming mechanism in the performance of its regular functions and means for drawing off a quantity of shuttle-thread for the next stitch also operated independently of the stitch-forming mechanism in the performance of its regular functions, substantially as described.

15. In a lock-stitch sewing-machine, the combination of stitch-forming mechanism including a needle, an oscillating shuttle and a stitch-setting device, means independent of the stitch-forming mechanism for drawing off a quantity of needle-thread for the next stitch, a shuttle-carrier bearing said oscillating shuttle, and means for moving said shuttle-carrier rearward to draw off a quantity of shuttle-thread for the next stitch while the needle-thread is held taut at the completion of the stitch by the stitch-setting device, substantially as described.

16. In a lock-stitch sewing-machine, the combination of stitch-forming mechanism, a pull-off for drawing off a measured quantity of needle-thread for the next stitch while the take-up rises which is afterward delivered upon the descent of said take-up, and means for drawing off a measured quantity of shuttle-thread for the next stitch while the take-up is holding the needle-thread taut at the completion of the stitch which is afterward delivered while the take-up descends, substantially as described.

17. In a lock-stitch sewing-machine, the combination of stitch-forming mechanism, a thread-clamp and pull-off for the needle-thread, the latter acting while the thread is clamped to draw a measured quantity of needle-thread off of its supply for the next stitch, a take-up for said needle-thread which operates to set the stitch, and means for drawing a measured quantity of shuttle-thread off of its supply while the needle-thread is held taut by said take-up at the completion of the stitch, and for thereafter delivering up said shuttle-thread for the next stitch, substantially as described.

18. In a lock-stitch sewing-machine, the combination of stitch-forming mechanism, a take-up for the needle-thread, a locking device for said thread, means for drawing off a measured quantity of needle-thread for the next stitch while the needle-thread is locked, and means for drawing

off a measured quantity of shuttle-thread for the next stitch also while the needle-thread is locked, substantially as described.

19. In a lock-stitch sewing-machine, the combination of stitch-forming mechanism, a thread-clamp, and pull-off for the needle-thread, the latter acting while the thread is clamped to draw a measured quantity of needle-thread off of its supply for the next stitch, means for taking up the needle-thread and for setting the stitch during which time the needle-thread is drawn taut, and means for drawing a measured quantity of shuttle-thread off of its supply while the needle-thread is thus held taut, substantially as described.

20. In a lock-stitch sewing-machine, the combination of stitch-forming mechanism, means independent of the stitch-forming mechanism for drawing off a supply of needle-thread for the next stitch, and means for drawing off a supply of shuttle-thread for the next stitch while the needle-thread is held taut at the completion of the stitch, substantially as described.

21. In a lock-stitch sewing-machine, the combination of stitch-forming mechanism, means independent of the stitch-forming mechanism for drawing off a supply of needle-thread for the next stitch, and means for drawing off a supply of shuttle-thread for the next stitch during the time the shuttle is not performing its regular functions, substantially as described.

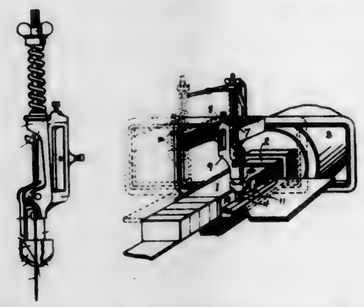
22. In a lock-stitch sewing-machine, the combination of stitch-forming mechanism, a thread-clamp and pull-off for the needle-thread, the latter acting while the thread is clamped to draw a measured quantity of needle-thread off of its supply for the next stitch, a take-up for the needle-thread which operates to set the stitch while the needle-thread is held clamped, and means for drawing a measured quantity of shuttle-thread off of its supply for the next stitch while the needle-thread is held taut, and during the time the shuttle is not performing its regular functions, substantially as described.

23. In a lock-stitch sewing-machine, the combination of stitch-forming mechanism, a thread-clamp, and pull-off for the needle-thread, the latter acting while the thread is clamped to draw a measured quantity of needle-thread off of its supply for the next stitch, a take-up for the needle-thread which operates to set the stitch while the needle-thread is held clamped, and means for drawing off a measured quantity of shuttle-thread while the needle-thread is held clamped and the take-up is holding the needle-thread taut at the completion of the stitch, substantially as described.

24. In a lock-stitch sewing-machine, a needle and a shuttle oscillating on parallel axes, a shuttle-carrier for said shuttle, and means for moving it toward and from the needle in a direction at right angles to the axis of said needle, substantially as described.

25. In a lock-stitch sewing-machine, a needle and a shuttle turning on parallel axes, a shuttle-carrier bearing said shuttle and means for moving it away from the needle in a direction at right angles to the axis of said needle, to provide working space for the needle, and also to draw off a measured supply of shuttle-thread, and for moving it in the opposite direction, toward the needle, to deliver said shuttle-thread and to bring the beak of the shuttle in correct position to enter the loop of needle-thread, and means for holding the needle-thread taut while the shuttle-carrier is moving away from the work, substantially as described.

705,064. BRICK-EDGE-SMOOTHING BLADE. WILLIAM FREY, Canton, Ohio. Filed May 16, 1902. Serial No. 107,678. (No model.)



Claim.—1. In a brick-cut-off table, a cut-off frame, a wire attached in said frame, a blade attached to said frame, and a slot in said blade through which said wire is passed.

2. In a brick-cut-off table, a cut-off frame, a wire attached in said frame, a blade pivotally connected with said frame, and a slot in said blade through which said wire is passed.

3. In a brick-cut-off table, a cut-off frame, a wire attached in said frame, a blade pivotally connected with said frame, and a slot in said blade through which said wire is passed, said slot being longitudinally elongated in its upper part.

4. In a brick-cut-off table, a cut-off frame, a wire attached in said frame, a blade attached to said frame, a slot in said blade through which said wire is passed, and a diagonal slit in the side of the blade opening into said slot.

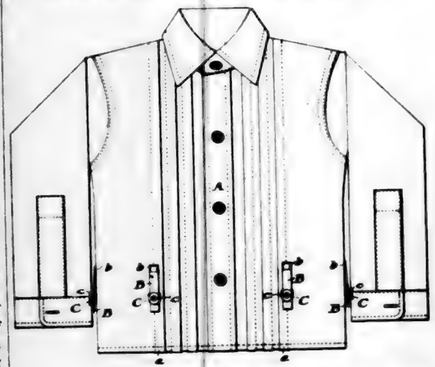
5. A brick-edge-smoothing blade having a cutting edge on one side, said cutting edge being curved at each end, and a slot in said blade from the cutting edge to the opposite side.

6. A brick-edge-smoothing blade having a cutting edge on one side, said edge being curved at each end to form acute bends on either side of the median line, and a slot in said blade from the middle of the cutting edge to the opposite side.

7. A brick-edge-smoothing blade having a cutting edge on one side, said edge being curved at each end, and a slot in said blade, said slot extending from a substantially round aperture in the cutting edge to an elongated opening in the opposite side.

8. A brick-edge-smoothing blade having a cutting edge on one side, said edge being curved at each end, a slot in said blade from the cutting edge to the opposite side, and a diagonal slit in one side of the blade opening into said slot.

705,065. APPAREL. JOHN C. FRIEDRICH, Bordentown, N. J. Filed Aug. 24, 1900. Serial No. 27,935. (No model.)



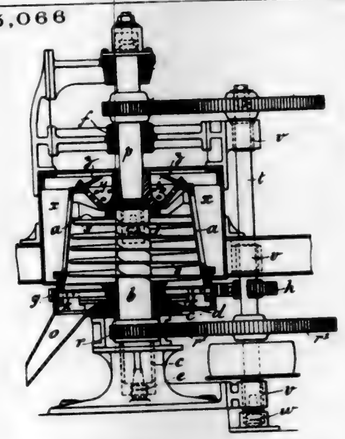
Claim.—1. In a boy's shirt-waist, the combination with a series of vertically-pending tabs respectively fixed at their upper extremities upon the exterior of the garment; of reinforces *a*, in registry with said tabs, and extending vertically therefrom to the top of the garment; a button upon each of said tabs; and, means connecting said buttons with said tabs, adjustable from the top to the bottom of the latter, substantially as set forth.

2. In a boy's shirt-waist, the combination with a series of tabs of equal width throughout their length, respectively fixed at their upper extremities upon the exterior of the garment; of reinforces *a*, in registry with said tabs and extending vertically therefrom to the top of the garment; a series of clasp-frames *c'*, respectively embracing the width of said tabs and adjustable from end to end thereof; a series of buttons *c*, respectively fixed upon said clasp-frames *c'*; and, a series of clasps c^2, respectively mounted in said clasp-frames and arranged to secure the latter in adjusted position upon said tabs, substantially as set forth.

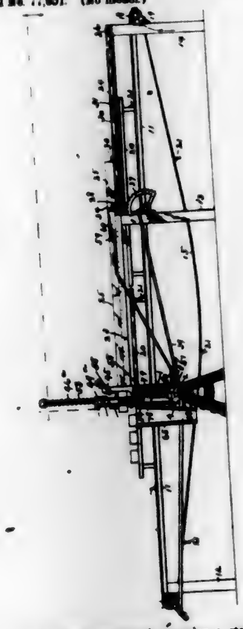
705,066. CENTRIFUGAL SEPARATOR. CARL FRIEDLEBEN, Halle, Germany. Filed Aug. 2, 1901. Serial No. 70,664. (No model.)

Claim.—A continuous working centrifugal separator, consisting of a conical drum, rotated from the top, a conical filling-chamber on the top of the drum and communicating with the interior through openings, a spiral conveyer mounted vertically in the drum and adapted to convey the material to be separated from the top to the bottom of the same, a means for rotating the conveyer from the bottom, a collecting-dish for receiving the separated material as it falls from the conveyer, and provided with a chute, and a wheel with depending blades mounted above the collecting-dish and adapted to be rotated to force the separated material down the chute substantially as described.

705,066



705,067. SOAP CUTTING AND SPREADING MACHINE. TIMOTHY GAYNOR, Jr., Indianapolis, Ind., assignor of four-fifths to Robert G. Haresnip and Solomon M. Gusdorf, Indianapolis, Ind. Filed Oct. 5, 1901. Serial No. 77,651. (No model.)



Claim.—1. In a soap cutter and spreader a stationary platform, means for moving slabs of soap in one direction over the platform with an intermittent movement, vertical wires in the path of the slabs for cutting the slabs longitudinally into bars and a horizontal wire reciprocating vertically at the end of the platform to cut the bars transversely into cakes, and a rack moving out from under the table at faster speed than the travel of the soap on the platform.

2. In a soap cutter and spreader a stationary platform over which slabs of soap are passed, means for cutting the slabs longitudinally into bars and transversely into cakes, an endless belt or apron upon which the slabs of soap are placed said apron having means to engage the slabs to cause them to travel therewith said apron traveling toward and delivering upon the platform and a rack passing under the delivery end of the platform at a faster speed than the travel of the apron, to receive the soap as it is cut into cakes.

3. In a soap cutter and spreader, a platform having vertical wire cutters and a vertically-reciprocating horizontal cutter, an endless carrier delivering upon said platform and a rack moving from under the platform to receive the soap as it is cut.

4. In a soap cutter and spreader, a table having a link belt moving longitudinally thereof, racks placed on the table and moved thereon by projections from the link belt, a platform above the table and of less length than said table, cutters adjacent to one end of the platform adapted to cut slabs of soap into longitudinal and transverse pieces when the soap is moved thereto over the platform and an endless moving apron to receive the soap to be cut said apron delivering the soap upon the platform by the action of projections therefrom to engage the soap.

5. In a soap-cutter a platform to receive the soap to be cut, means to compel the soap to travel in one direction over the platform and means while so traveling for cutting the soap parallel with the direction of travel and transversely thereto.

6. In a soap cutter and spreader, a platform, means for compelling slabs of soap to travel thereover, vertical wires in the path of the soap slabs to cut them into bars and a cutter reciprocating vertically and transversely of the platform adjacent to but beyond or outside of the end thereof and a rack moving from under the platform to receive the soap as it is cut.

7. A stationary platform, an endless belt or apron to receive slabs of soap and discharge them upon the platform, a rack adapted to move from under the platform at a faster rate of travel than that of the apron, vertical cutters to cut the soap into bars as it passes over the platform, a transverse horizontal cutter to cut the soap into cakes as it passes off of the platform said horizontal cutter being held normally above the platform, means for vertically reciprocating the horizontal cutter and means for moving the apron and rack intermittently said apron and rack movement alternating with the reciprocation of the horizontal cutter.

8. A stationary table having cutters, an endless belt to receive slabs of soap and deliver them to the table and force them through the cutters on the table, a shaft having a roller around which the belt travels, a cogged wheel loosely mounted on the shaft and having a pawl, a ratchet-wheel fixed on the shaft and engaged by the said pawl, a toothed segment engaging the cogged wheel, a transverse reciprocating cutter at the opposite end of the platform from the belt and means for rocking the toothed segment and reciprocating the transverse cutter at alternate periods.

9. A table, an endless link belt longitudinally thereof having means to engage a rack or racks placed on said table, a shaft having a sprocket-wheel around which the link belt passes, a lever loosely mounted on the shaft, said lever having a pawl, a ratchet-wheel mounted on the shaft and turning with it, said pawl engaging said ratchet-wheel, a revoluble shaft having a crank-wheel with a wrist-pin, a rod connecting the wrist-pin with the lever, racks moved along the table by the link belt, a platform over the table having soap-cutters and means for passing slabs of soap along the table through the cutters and depositing same upon said racks.

10. A platform having slabs of soap traveling in one direction thereon, and means for cutting the soap transversely of its direction of travel, consisting of vertical wires, heads sliding thereon, springs to elevate the heads, a frame secured to the heads and carrying a tant transverse cutting-wire, a revoluble shaft having wheels with side pins levers pivotally secured to each head depending therefrom and terminating opposite the hubs of the wheels and having notches to engage the pins in the wheels, fixed stop-pins and notches in the levers to engage the stop-pins.

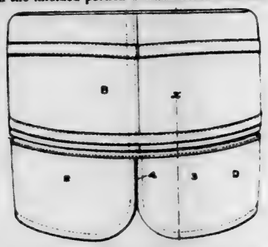
11. In a soap-cutting machine, a main driving-shaft having a sliding clutch-half feathered to said shaft, a revoluble pulley loosely mounted on said shaft, a bell-crank, a rod connecting the sliding clutch-half with one of the arms of the bell-crank, an endless apron on which the soap is deposited and fed therefrom to the machine, projections from said apron and a push-bar in the path of said projections adapted to contact therewith, said push-bar being connected with the bell-crank.

705,068. APPAREL-CAP. CHARLES W. GORDON, St. Paul, Minn. Filed Apr. 8, 1902. Serial No. 101,866. (No model.)

Claim.—1. A cap of the class described, comprising a cap-body and its side wall, a flexible sweat-band formed of two plies of material having a lower part secured to the inside of the side wall and extending substantially to the lower edge thereof, and an unsecured upper part, and a head-protector extending around the sides and rear of the cap and secured along one edge to the unsecured edge of the sweat-band, and between the plies thereof, substantially as described.

2. The combination, with the side wall of a cap formed with an infolded lower portion 6, of a flexible sweat-band formed of two plies of material and secured to the infolded portion between the upper and lower

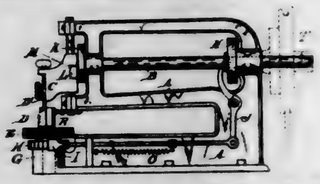
edges thereof, and a head-protecter secured to the free edge of the sweat-band and between the plies thereof, the free portion of the sweat-band being of sufficient width to allow the head-protector to stand in alinement with the side wall of the cap when turned down, and to stand in alinement with the infolded portion 6 when folded into the cap.



3. A cap of the class described, comprising a cap-body and a two-part head-protector foldably secured to the inside of the cap-body, the head-protector parts extending forwardly to the front of the cap-body and substantially meeting at their rear ends, the rear ends being flexibly connected along their adjacent edges and nearly to the bottom thereof so as to stand flush with each other, and having their lower parts below such point of union free and unconnected, substantially as and for the purpose described.

4. A cap comprising a cap-body and its side wall, the lower part of the side wall being turned inwardly and up on itself to form an infolded portion 6, a flexible sweat-band formed of two plies of material secured to said infolded portion from the lower edge thereof to approximately the middle point thereof, and having an unsecured portion of greater width than the secured portion, and a head-protector secured along one edge to the unsecured edge of the sweat-band and between the plies thereof, whereby the protector, when folded within the cap, will stand substantially in alinement with the infolded portion 6, and when turned down will swing out of the cap-body into alinement with the outer part of the side wall, substantially as described.

705,069. VAMP-SKIVER. JOSEPH G. GRALL, Detroit, Mich., assignor, by mesne assignments, to the Robert Mitchell Machinery Company, a Corporation of Michigan. Filed Dec. 27, 1898. Renewed Oct. 28, 1901. Serial No. 80,279. (No model.)



Claim.—1. In a leather-skiving machine, the combination with a supporting-frame, of a feed-table rotatably supported in the frame, a work-guide fixedly secured above the table independently thereof having a vertical slot through which the cutting edge of the knife projects and a vertically-reciprocating knife supported in the frame above the table having the horizontal cutting edge arranged radially with the table.

2. In a leather-skiving machine, the combination with a supporting-frame, of a circular feed-table means for intermittently turning the same on its vertical axis, a reciprocating knife in vertical guides above said table, and with its cutting edge in a plane radially with the table, and a work-guide supported above the table and independently thereof having a rounded face concentric with the table and a vertical slot through which the cutting edges of the knife project outwardly.

3. In a leather-skiving machine, the combination with the supporting-frame, of an intermittently-operated circular feed-table, a reciprocating knife in a radial plane with the table and having horizontal and vertical cutting edges, and a work-guide secured in relation to the knife having a rounded face concentric with the table and a slot in said face through which the cutting edges of the knife freely project.

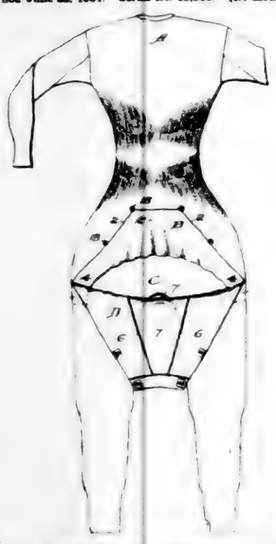
4. In a leather-skiving machine, the rotary circular feed-table having a knurled rim in combination with the reciprocating knife vertically adjustably secured in the frame of the machine and the stationary work-guide, adjustably secured above the feed-table and independently thereof.

5. In a leather-skiving machine, the rotary circular feed-table having the knurled rim and the cutting-block centrally recessed in the table in combination with the reciprocating knife and stationary slotted work-guide, horizontally adjustable on the frame.

6. In a leather-skiving machine, the reciprocating knife having a shank and knife-blade formed with vertical and horizontal cutting edges thereon, in combination with the stationary tubular work-guide around the shank of the knife adjustably secured in relation thereto, and provided with a slot through which the knife-blade of the knife projects radially to said guide.

7. In a leather-skiving machine, the combination with the frame and drive-shaft, of the vertically-reciprocating cross-head arranged in vertical guides of the frame, the knife carried by said cross-head, the circular feed-table below the knife, the stem F carrying the table, the ratchet-wheel H secured upon said stem and having actuating connection with the drive-shaft for imparting intermittent motion to the feed-table, and the slotted tubular work-guide R stationarily mounted above the feed-table.

705,070. UNION GARMENT. WILLIAM A. GRAHAM, St. Joseph, Mo. Filed June 22, 1901. Serial No. 65,588. (No model.)



Claim.—1. In an undergarment having an opening in the back of the body of said garment extending downward approximately to the crotch of the garment, broad at the base and narrowing gradually upward, a curtain inserted therein, said curtain being curved on its lower edge to leave an opening and having extensions on each side connected to the edge of said opening and to the fabric below said edge, combined with a flap corresponding with said opening first named and fastening means, substantially as described.

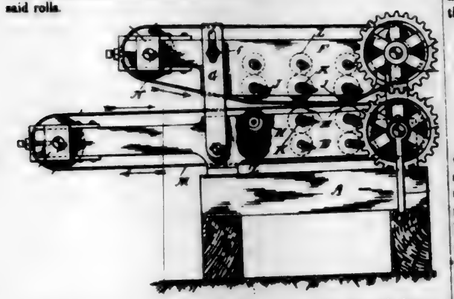
2. In an undergarment, having an opening in the back, a flap to cover said opening, said flap being broader at its lower edge and narrowed gradually upward, and being formed of two side parts continuous with the fabric of the garment, and also of a separate central part connected to the part 6 and body of the garment which extends downward to form the crotch of the garment and upward in front whereby a central seam is avoided, all substantially as described.

705,071. MACHINE FOR FACING FRUIT FOR PACKING. LOZELLE F. GRAHAM, San Jose, Cal. Filed Jan. 9, 1902. Serial No. 88,971. (No model.)

Claim.—1. In a fruit-facing machine, the combination of opposing frames, one of which is adjustable in an arc of a circle to and from the other, a series of pairs of opposing cushioned pressure-rolls carried by said frames, said pairs being adapted by the adjustment of said frame to have their members separated by successively-decreasing distances from the first to the last pair, rigid backing-rolls carried by the frames for holding said pressure-rolls in place and means for feeding the fruit between said rolls in the direction of said decreasing distances.

2. In a fruit-facing machine, the combination of opposing pneumatic pressure-rolls between which the fruit is passed and rigid backing-rolls for said pneumatic rolls to hold them in place.

3. In a fruit-facing machine, the combination of opposing cushioned pressure-rolls, means for relatively adjusting said rolls, to vary their pressure, rigid backing-rolls for said pressure-rolls to hold them in place and endless traveling carriers arranged to carry the fruit between them through said rolls.



4. A fruit-facing machine consisting of relatively adjustable frames, cushioned pressure-rolls carried by said frames and disposed in superposed pairs, rigid backing-rolls carried by the frames for holding said pressure-rolls in place, terminal drums carried by the frames, endless carriers mounted on the drums and passing between the rolls, and suitable means for driving said carriers and rolls.

705,072. RUBBER TIRE. ARTHUR W. GRAFF, Springfield, Ohio, assignor to the Consolidated Rubber Tire Co., New York, N. Y., a Corporation of New Jersey. Filed Mar. 23, 1900. Serial No. 9,946. (No model.)

Claim.—1. In a vehicle-tire, the combination with a flat channelless metallic band having openings therein, of a rubber tire, flat on its base, to fit said metallic band, with projections thereon to fit in the openings in said band, and independent retaining-wires extending through said rubber, substantially as specified.

2. In a tire for vehicle-wheels, a rubber tire with a substantially flat base, having projections formed on said base, and flat metallic band having openings therein to receive the projections on the tire, the edges of said band being rounded, the rounded part extending beyond the tire and the felly on which it rests, and independent retaining-wires extending through the rubber on opposite sides of said projections, substantially as specified.

705,073. DEVICE FOR PREVENTING HUMMING OF TELEPHONE-WIRES. MAGGIE GROVER, Bidwell, Ohio. Filed Sept. 6, 1901. Serial No. 74,563. (No model.)

Claim.—1. A device of the class described comprising a split flexible body of dampering material having a passage to receive and hold a wire and with which the split communicates to permit of entrance of the wire to the passage, said body having a peripheral groove to receive an attaching-band.

2. A device of the class described comprising a body of rubber having a central axial passage to receive a wire, said body being split from the passage outwardly through its side and having a peripheral groove at a point between its ends to receive a compressing and attaching band.

705,074. ATOMIZER. JAMES G. HALAPLEN, Toledo, Ohio. Filed Dec. 31, 1901. Serial No. 87,921. (No model.)

Claim.—1. In an atomizer, the combination with a liquid-container provided with a spray-nozzle and with a liquid-tube communicating therewith, of a chambered cap for said liquid-container, a barrel connected to said liquid-container, a plunger arranged within said barrel, a spring located in the barrel for elevating said plunger, a plunger-rod connected to the plunger and provided with a head to close the chamber of said cap, and means for locking the plunger and head in depressed position against the action of the spring, substantially as set forth.

2. In an atomizer, the combination with a liquid-container provided with a spray-nozzle and with a liquid-tube communicating therewith, of a chambered cap for said liquid-container, a barrel connected to said liquid-container and provided with a cap having a central aperture and diametrically opposite slots, a plunger arranged within said barrel, a spring located within the barrel between said plunger and the bottom of the cap, a plunger-rod connected to the plunger, a head connected to the plunger-rod and of a diameter corresponding with the internal diameter of the container-cap, and a cross-pin carried by said rod and adapted to lock the rod in depressed position against the action of the spring, substantially as set forth.

3. In an atomizer, the combination of a liquid-container, of a spray-nozzle and tube connected therewith, a barrel, with an opening and a spirally-hung spring-valve at the lower end thereof opening outwardly therefrom, located within said liquid-container and protected by a cap with an orifice therein, and a plunger working in said barrel, and at the lower end of said plunger, an opening and a spirally-hung spring-valve, opening downward, substantially as set forth.

4. In an atomizer, the combination with a liquid-container provided with a spray-nozzle and with a liquid-tube communicating therewith, of a chambered cap for said liquid-container, a barrel connected to said liquid-container and provided with a cap having a central aperture and diametrically opposite slots, and a lower cap with opening, an outwardly-opening valve, a plunger arranged within said barrel, with opening therein, and a valve opening inwardly, a spring located in the barrel between said plunger and the bottom of the cap, a plunger-rod connected to the plunger, a head connected to the plunger-rod and of a diameter corresponding with the internal diameter of the container-cap, and a cross-pin carried by said rod and adapted to lock the rod in depressed position, substantially as set forth.

705,075. CAR-SEAT. HENRY S. HALE, Philadelphia, Pa. Filed Apr. 2, 1902. Serial No. 101,109. (No model.)

Claim.—1. A pedestal for a car-seat consisting of a flat vertical plate having its bottom flanged, combined with a second plate secured at its side edges to the corresponding edges of the flat plate and having its middle portion curved or bulged outward and its lower part curved outward into a flanged foot on a level with the bottom flange of the flat plate.

2. A pedestal for a car-seat consisting of a flat vertical plate having its top and bottom flanged, combined with a second plate secured at its side edges to the corresponding edges of the flat plate and having its middle portion curved or bulged outward and its lower part curved outward into a flanged foot on a level with the bottom flange of the flat plate.

3. A pedestal for a car-seat consisting of a flat vertical plate having its top and bottom flanged and also formed with hollow corner-ribs at the juncture of the body and top flange, combined with a second plate secured at its edges to the corresponding edges of the flat plate and having its middle portion curved or bulged outward and its lower part curved

outward into a flanged foot on a level with the bottom flange of the flat plate.

4. A pedestal for a car-seat consisting of a flat vertical plate having its top and bottom flanged, combined with a second plate secured at its edges to the corresponding edges of the flat plate and having its middle portion curved or bulged outward and its lower part curved outward into a flanged foot of semi-elliptical shape on the level with the bottom flange of the flat plate.

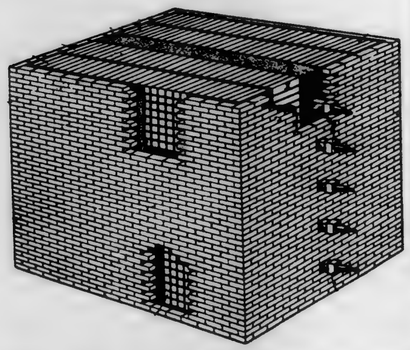
5. In a pedestal, the combination of the vertical flat plate A having the flange J at the top and foot K at the bottom and recessed on its edges as at i, a front plate M of corresponding shape but not so high curved or bulged at its middle and flanged at the bottom to form a flaring semi-elliptical base, and secured to the plate A at the side edges thereof.

6. In a pedestal, a rear flat plate having a flange at its top, combined with a front plate secured to the side edges of the flat plate and having its middle part rounded outward or bulged and its lower part flared into a semi-elliptical base.

7. A car-seat pedestal consisting of two sheet-steel plates secured together at their side edges one of which plates is flat and the other outwardly curved or bulged and flared at the bottom to form a spread or extended base.

8. A car-seat pedestal consisting of the combination of two plates of metal meeting at their side edges and separated in the middle and further united at their side edges by having the edge of one plate flanged over and clamped upon the edge of the other plate and also having the lower parts of these plates shaped to form a flaring base.

705,076. MANUFACTURE OF CARBON ELECTRODES. CHARLES M. HALL, Niagara Falls, N. Y. Filed Feb. 19, 1902. Serial No. 94,726. (No specimens.)



Claim.—1. The method herein described of baking carbon articles, which consists in placing them in proximity to a conducting path or core, insulating the articles or groups of articles, and passing a current through the core; substantially as described.

2. The method herein described of baking carbon electrodes, which consists in placing them in proximity to a conducting path or core, insulating the electrodes or groups of electrodes from each other, and passing a current through the core; substantially as described.

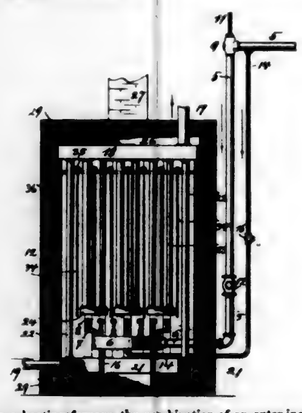
3. The method herein described of baking carbon electrodes, which consists in placing them in proximity to a conducting path or core, interposing refractory insulating material between the electrodes or groups of electrodes, and passing a current through the core; substantially as described.

4. The method herein described of baking carbon electrodes, which consists in placing them in proximity to a conducting path or core in piles transversely to the core with their ends in proximity thereto, insulating the electrodes or groups of electrodes, and passing a current through the core; substantially as described.

5. The method herein described of baking carbon electrodes, which consists in placing them in proximity to a conducting path or core, insulating the electrodes or groups of electrodes, piling other electrodes outside the first-named electrodes, heating the latter by heat transmitted through the inner electrodes, and subsequently placing them next to a core to receive final baking; substantially as described.

705,077. GAS-FURNACE. FRANK G. HAHN, Cincinnati, Ohio. Filed Nov. 17, 1900. Serial No. 36,502. (No model.)

Claim.—1. In a heating-furnace, the combination of an outer inclosure forming a heating-chamber within, a horizontally-disposed head 18 closing the upper part of this chamber by being supported all around on the outer inclosure, a smoke-chamber 26 above this head, smoke-flues passing through this latter and connecting the heating-chamber below it with the smoke-chamber above it, a horizontally-disposed hollow base 21 in the lower part of the heating-chamber arranged around the sides thereof, pipes 22 connecting this base with head 18 in a manner to leave a space between them, drop heating-tubes depending from head 18 filling this space and arranged in pairs by having the lower ends of two adjacent tubes connected for communication and one of the tubes in each pair being of larger diameter than the other tube thereof and a multiple gas-burner to supply heat to this furnace.



2. In a heating-furnace, the combination of an outer inclosure forming a heating-chamber within, a horizontally-disposed head 18 closing the upper part of this chamber by being supported all around on the outer inclosure, a smoke-chamber 26 above this head, smoke-flues passing through this latter and connecting the heating-chamber below it with the smoke-chamber above it, a horizontally-disposed hollow base 21 in the lower part of the heating-chamber arranged around the sides thereof, pipes 22 connecting this base with head 18 in a manner to leave a space between them, drop heating-tubes depending from head 18 filling this space and arranged in pairs by having the lower ends of two adjacent tubes connected for communication and one of the tubes in each pair being of larger diameter than the other tube thereof and means to supply heat to this furnace.

3. In a heating-furnace, the combination of an outer inclosure forming a heating-chamber within, a horizontally-disposed head 18 closing the upper part of this chamber by being supported all around on the outer inclosure, a smoke-chamber 26 above this head, smoke-flues passing through this latter and connecting the heating-chamber below it with the smoke-chamber above it, a horizontally-disposed hollow base 21 in the lower part of the heating-chamber arranged around the sides thereof, pipes 22 connecting this base with head 18 in a manner to leave a space between them, drop heating-tubes depending from head 18 filling this space and arranged in pairs, an independent joint 24, box-shaped and of copper which connects to the lower end of each pair, one of the tubes of each pair being of larger diameter than the other and means to supply heat to this furnace.

4. A gas-furnace having within its heating-chamber pipes and tubes intended to be heated and vertically arranged with spaces between them, rods 35, horizontally supported in a fixed position in the upper part of these spaces and sheets of non-combustible material also vertically arranged and suspended on these rods in a line parallel to the line of draft and adapted to absorb and retain the heat for radiation, substantially as shown and described.

705,078. ACETYLENE-GAS GENERATOR. WILLIAM S. HAHN and JOHN A. MOSHER, Chicago, Ill., assignors to the Adams & Westlake Company, a Corporation of Illinois. Filed Jan. 14, 1901. Serial No. 43,172. (No model.)

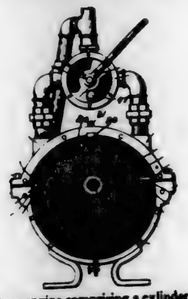
Claim.—1. The combination with an acetylene-generating chamber, of a water-passage leading thereto, and a spring-supported longitudinally-movable rod or spindle located within such passage, and of such size as to so restrict the passage that an excess of gas-pressure will stop the flow of water.

2. In a combined acetylene-generator and shipping-case, a tank having an attaching-nipple, means for hermetically sealing the tank when not in service, a carbid-container fixedly held within the tank and comprising a plurality of compartments each having a foraminous cover whereby water dripping from one compartment is distributed over the entire surface of the contents of the one next below.

3. In a combined acetylene-generator and shipping-case, a tank having a valve-controlled attaching-nipple, a carbid-container fixedly held within the tank and comprising a plurality of compartments each having a foraminous cover whereby water dripping from one compartment is distributed over the entire surface of the contents of the one next below.

4. In a combined acetylene-generator and shipping-case, a tank, a carbid-container comprising a plurality of compartments each having a foraminous cover whereby water dripping from one compartment is distributed over the surface of the contents of the one next below, a removable cover for the tank such cover having a valve-closed nipple and being adapted to engage the top of the carbid-container and fixedly secure the same.

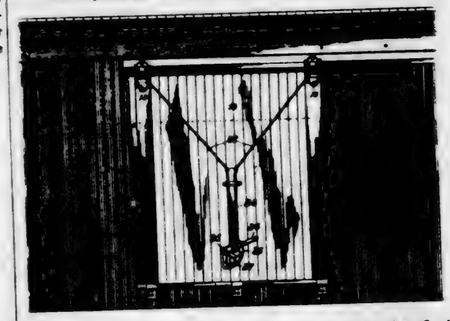
705,079. ROTARY STEAM-ENGINE. JAMES T. HAYS and JOHN W. WILSON, Garland, Tex. Filed Mar. 12, 1901. Serial No. 50,671. (No model.)



Claim.—1. A rotary engine comprising a cylinder divided in a plane parallel with and to one side of the axis of the cylinder, an arcuate plate disposed against the inner face of the minor section of the cylinder and having its ends turned outwardly and clamped between the sections, said plate having openings therein, ports in the cylinder leading to said openings, and a piston rotatably mounted in the cylinder eccentric to the cylinder and in contact with the plate, said piston having heads adapted for projection at diametrically opposite points of its periphery and in contact with the inner periphery of the cylinder.

2. In a rotary engine the combination with a cylinder having the rotatable piston therein provided with a shaft extending interiorly of the cylinder, said piston having heads and adapted for reverse rotation, of a throttle-valve including a casing, pipes connecting the casing with the cylinder and supporting the casing, a steam-feed pipe connected to the casing, a steam-exhaust pipe connected with the casing, a casing encircling the piston-shaft exteriorly to the cylinder and having ports in its opposite ends and with which casing the steam-feed pipe is connected at one of the ports to hold the casing against movement, a steam-supply pipe connected with the last-named casing at the second port thereof and a valve within the second casing fixed to and rotatable with the shaft for intermittently cutting off communication between the supply and feed pipes.

705,080. DOOR-HANGER. JOHN J. HENNESSEY, Milwaukee, Wis. Filed Sept. 20, 1901. Serial No. 75,938. (No model.)



Claim.—1. A door-hanger comprising a bracket adapted for fixed attachment to a door, a hook portion attached to said bracket, a roller, a link carrying said roller, and a lift-lever, whereby the weight of the door is transferred from the hook portion to the roller, or vice versa, substantially as described.

2. A door-hanger comprising a bracket for fixed attachment to a door, a link secured thereto, means carried thereby for supporting the door therefrom in its open position, a lift-lever connecting said bracket and link, means for supporting the door in its closed position, and means for actuating said lift-lever, whereby the weight of the door is transferred from said link to said other supporting means, substantially as described.

3. A door-hanger comprising a bracket for fixed attachment to a door, a hook, a link secured to said bracket, means carried thereby for supporting the door in position to be opened, a lift-lever connecting said bracket and link and means for actuating said lift-lever to transfer the weight of the door from said hook to said link, or vice versa, substantially as described.

705,081. BRACKET FOR SLIDING DOORS. JOHN J. HENNESSEY, Milwaukee, Wis. Filed Oct. 14, 1901. Serial No. 78,572. (No model.)

Claim.—1. A door-bracket comprising the combination with a body portion, of a toe-piece constructed to swing about its point of support, substantially as described, and thereby exert pressure upon a door.

2. A door-bracket comprising a body portion constructed for attachment to the side of a car, a toe-piece constructed to exert pressure against a door tending to hold the same against the side of a car, when it is in closed position, and a pivotal support for said toe-piece upon said body portion, substantially as described.

3. A door-bracket comprising a body portion, a pivotally-mounted toe-piece, and shoulders whereby said toe-piece, when resting in outer or open position, is prevented from excessive pivotal movement, substantially as described.

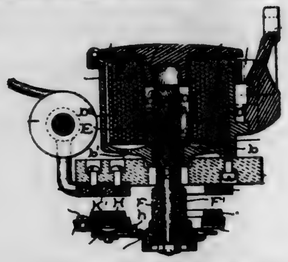
705,082. SURFACE-CONTACT ELECTRIC RAILWAY. EDWARD M. HEWLETT, Schenectady, N. Y., assignor to the General Electric Company, a Corporation of New York. Filed Oct. 30, 1897. Serial No. 656,777. (No model.)

Claim.—1. In an electric switch, the combination with a contact, of a movable support, an electromagnet for moving said support toward the contact, and a second contact on the support, one of said contacts having a ball-and-socket joint, whereby it can adjust itself to the other contact when the magnet moves the support.

2. In an electric switch, the combination with a contact, of a movable support, an electromagnet for moving the latter toward said contact, and a contact which has a ball-and-socket joint with said support, whereby it can adjust itself to the first contact.

3. In an electric switch, the combination with a contact, of an electromagnet, a contact-support adapted to be moved toward said contact by the movable member of said magnet, and a contact having a ball-and-

socket joint with said support, whereby said contact can adjust itself with the first contact when caused by said magnet to engage therewith.



4. In an electric switch, the combination with the switch-contacts, of an electromagnet to bring said contacts into engagement, and means for permitting lateral play to at least one of said contacts, whereby it can adjust itself to the other when caused to engage therewith by the magnet.

5. In an electric switch, the combination with a contact, of a second contact normally held separated therefrom by gravity, one of said contacts being mounted to have lateral play, and an electromagnet for lifting the second contact into engagement with the first.

6. The combination with a fixed contact, of a support carrying a second contact, said support being movable to and from said fixed contact, and being normally held by gravity in such position that said contacts are separated, said second contact being adapted to adjust itself to said fixed contact when it is moved into engagement therewith, and a magnet-coil for raising said support.

7. The combination with a plurality of fixed contacts, of a plurality of contacts all normally separated from said fixed contacts, but adapted to be moved into engagement therewith, each being capable also of an independent movement.

8. The combination with a pluralisy of fixed contacts, of a support movable to and from said contacts, a plurality of contacts mounted on said support in ball-and-socket joints, and a coil for moving said support.

9. In an electric switch, the combination with a contact, of an electromagnet, a contact-support normally separated from said contact, but adapted to be moved theretoward by said magnet, and a contact so mounted on said support that it is adapted to adjust itself to the first contact by movement in the arc of a circle when it is moved into engagement therewith.

10. In an electromagnetic switch, the combination with a support of magnetic material, of an energizing-coil mounted on said support, fixed contacts insulated from said support, a movable core having one end which has a normal position beyond said support, a non-magnetic support inside the coil for the core, and contacts carried by the projecting end of the core which are adapted to engage with said fixed contacts.

11. An electric switch which comprises a support provided with hooks for suspension, an energizing-coil mounted on said support, fixed contacts mounted on the support, a movable core normally resting on the support and having a lower end which depends below the support, and contacts mounted on said lower end adapted to engage with said fixed contacts.

12. The combination with a casing of magnetic material, of a magnet-coil inclosed and supported by said casing, a movable core, passing through an opening in the bottom of said casing, and a hole in the bottom of the casing for the escape of condensed moisture.

13. The combination with a casing of magnetic material provided with holes in its bottom, of a magnet-coil mounted on an insulating-spool supported in a raised position in said casing, and a movable core passing through an opening in the bottom of said casing.

14. The combination with a casing of magnetic material, of a magnet-coil inclosed and supported by lugs on the inside of said casing, fixed contacts located outside said casing, and contacts mounted on the end of the core which is outside of the casing and adapted to engage with said fixed contacts.

15. In an electric switch, the combination with a contact, of an electromagnet, a conducting-support connected in circuit and adapted to be moved toward said contact by the magnet, a contact movably mounted on said support, whereby it can adjust itself to the first contact, and a flexible electric connection between said movably-mounted contact and its support.

16. In an electric switch, the combination with the contacts, of a support movable with respect thereto through different planes, a contact-holder movably mounted upon said support, and a contact secured in said holder.

17. In an electric switch, the combination with a contact, of a support movable with respect thereto, and a contact having a ball-and-socket joint with said support.

18. In an electric switch, the combination with an electromagnet, of a block of insulating material secured to the end of the movable core, a switch-piece support having a central hole fitting over said block, so that the support rests on the block, and a plurality of switch-contacts mounted on said support.

19. In an electric switch, the combination with an electromagnet, of a magnetic casing therefor having a hole through which the core of the magnet extends, switch-contacts carried by the core, and a non-magnetic sleeve arranged to prevent the core from sticking to the sides of the hole in the casing, said sleeve being of sufficient inner diameter to permit play for the core, whereby the switch-contacts can adjust themselves when they become worn by arcing.

20. In an electric switch, the combination with an electromagnet, of a casing therefor having a hole through which the magnet-core extends, and switch-contacts carried by the core, the hole in the casing being of sufficient diameter to permit play for the core, whereby the switch-contacts can adjust themselves when they become worn by arcing.

21. In an electric switch, the combination with an electromagnet having a movable core, of a support carried by the core, contact-holders mounted on said support, and clamps for holding the contacts in the holders.

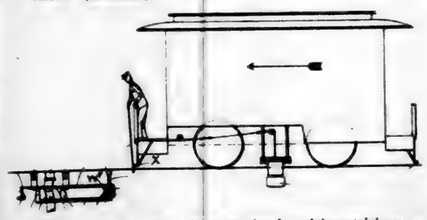
22. In an electric switch, the combination with a support formed with depressions, of contact-holders having rounded portions fitting said depressions, to form ball-and-socket joints, and a flexible electric connection between said holders and the supports.

23. In an electric switch, the combination with a plurality of fixed contacts, of an electromagnet, a contact-support adapted to be moved toward said contacts by the movable member of said magnet, and a plurality of contacts each of which is independently and movably mounted on said support.

24. In an electrically-operated switch, the combination with the energizing-coil, of fixed contacts, a movable core for the coil, contacts carried by the core each non-concentric with the axis of the core, a stationary sleeve of non-magnetic material between the coil and core, a longitudinal slot in said sleeve, and a pin carried by the core and engaging in the slot in the sleeve to prevent rotation of the core.

25. An electric switch, which comprises a box of magnetic material provided with a hole, a coil inclosed and supported thereby, an insulating-base on which said box is mounted, said base being provided with a hole registering with the hole in the box, contacts on the side of the base opposite to the box, a core for the coil, which moves through the holes in the box and base, and contacts carried by the core to engage the contacts on the base.

705,088. ELECTRIC RAILWAY. FREDERIC W. HILD and SAMUEL B. STEWART, Jr., Schenectady, N. Y., assignors to General Electric Company, a Corporation of New York. Filed Nov. 30, 1900. Serial No. 38,133. (No model.)



Claim.—1. In a railway having a closed conduit containing a conductor arranged to be engaged by a car-collector traveling through a comparatively narrow longitudinal slot, the combination with a cover for an opening into the conduit at a place where it is desired to remove the collector from the conduit, of underground mechanism connected with the cover, and constructed and arranged to be operated by the car to move said cover.

2. In a railway having a closed conduit containing a conductor arranged to be engaged by a car-collector traveling through a comparatively narrow longitudinal slot, the combination with a cover for an opening in the conduit at a place where it is desired to remove the collector from the conduit, of underground mechanism connected with the cover, and constructed and arranged to be operated by the car to move said cover to both open and close said opening.

3. In a railway having a closed conduit containing a conductor arranged to be engaged by a car-collector traveling through a comparatively narrow slot, the combination with a cover for an opening in the conduit at a place where it is desired to remove the collector from the conduit, of

underground mechanism connected with the cover and constructed and arranged to be operated by the wheels of a car to move said cover.

4. In a railway having a closed conduit containing a conductor arranged to be engaged by a car-collector traveling through a comparatively narrow slot, the combination with a cover for an opening in the conduit at a place where it is desired to remove the collector from the conduit, of underground mechanism connected with the cover and constructed and arranged to be operated by the wheels of a car to move said cover so as to both open and close said opening.

5. In a railway having a closed conduit containing a conductor arranged to be engaged by a collector traveling through a comparatively narrow slot, the combination with a cover for an opening in the conduit at a place where it is desired to remove the collector from the conduit, of mechanism beneath the surface of the roadway for moving said cover, and buttons arranged to be depressed by the wheels of a car to operate said mechanism.

6. The combination with a conduit-cover, of normally inoperative means which is operated by the car, for moving the cover, and means for rendering said means operative.

7. The combination with a conduit-cover, of normally inoperative means which is operated by the car, for moving the cover, and means controlled from the car for rendering said means operative.

8. The combination with a conduit-cover, of mechanism for operating the cover, a normally depressed button operated by a forward car-wheel to actuate the mechanism to open the cover, and a normally depressed button operated by a rear car-wheel to actuate the mechanism to close the cover.

9. The combination with a conduit-cover, of mechanism for operating the cover, an opening-button which is depressed by a forward car-wheel to actuate the mechanism to open the cover, and a normally depressed button which is raised when the opening-button is depressed and is then depressed by a rear car-wheel to close the cover.

10. The combination with a conduit-cover, of mechanism for operating said cover, a normally depressed opening-button adapted when raised to be depressed by a car, means for raising said button, means whereby when said button is depressed, it actuates said mechanism to open the cover, a normally depressed closing-button, and means whereby the actuation of said mechanism to open the cover, raises the closing-button, and whereby the depression of the latter actuates said mechanism to close the cover.

11. The combination with a conduit-cover, of mechanism for operating said cover, a normally depressed opening-button adapted when raised to be depressed by a car, two normally depressed closing-buttons, one in front and one in rear of the opening-button, each adapted when raised to be depressed by a car, and both being normally incapable of being raised, means controlled by a car moving in either direction, for raising the opening-button, and rendering the rear button with respect to the direction of movement of the car, capable of being raised, means whereby when the opening-button is depressed, it actuates the mechanism to open the cover, means whereby when said mechanism is so actuated, the rear opening-button is raised, and means whereby when the rear opening-button is depressed, it actuates said mechanism to close the cover.

12. The combination with a conduit-cover, of mechanism for operating the cover, a normally depressed opening-button, a toggle-support therefor, a toggle-rod for knuckling the toggle-support and thereby raising the button and means operated by a car moving in either direction to move the toggle-rod always in one direction.

13. The combination with a conduit-cover, of a button for opening the cover, a toggle-support therefor, a toggle-rod for knuckling the toggle and thereby raising the button, a reversing-lever connected to the toggle-rod, and a lever operated by a car moving in one direction to engage the toggle-lever and move it to knuckle the toggle, and operated by a car moving in the other direction to engage the reversing-lever to move the toggle-lever in the same direction as before to knuckle the toggle.

14. The combination with a conduit-cover, of a button which is depressed by a forward car-wheel to open the cover, independently-supported closing-buttons, one before and the other behind said button, means whereby the depression of the opening-button raises the closing-button which is to the rear with respect to the direction of motion of the car, so that it can be depressed by the rear car-wheel to close the cover, and means operated by the car for adapting said rear closing-button to be raised by the depression of the opening-button.

15. The combination with a conduit-cover, of mechanism for operating the cover, a button which is depressed by a forward car-wheel to actuate said mechanism to open the cover, independently-supported closing-buttons, one before and the other behind said button, a dog-rod for the closing-buttons which has connection with said mechanism, whereby the closing-button on the rear of the opening-button with respect to the motion of the car, is raised when the opening-button is depressed, and means operated by the car for preliminarily raising the opening-button and for moving the dog-rod to make said rear closing-button operative by said mechanism.

16. The combination with a conduit-cover, of mechanism for operating the cover, a button which is depressed by a forward car-wheel to actuate said mechanism to open the cover, means operated by the car for raising said button, and a button in the rear of the opening-button and having connection with said mechanism whereby it is raised when the opening-button is depressed, and whereby it actuates the mechanism to close the cover when it is depressed by a rear-car-wheel.

17. The combination with a conduit-cover, of mechanism for operating the cover, an opening-button which in being depressed, actuates said mechanism, a toggle-support for said button, means for knuckling the toggle to raise the opening-button, a closing-button which is raised by the depression of the opening-button through said mechanism, and is depressed to close the cover through said mechanism, an unknuckling toggle-rod, and means operated by the closing-button through said mechanism to actuate said unknuckling toggle-rod.

18. The combination with a conduit-cover, of a button, a toggle-support therefor, a plunger controlled by the button, a bell-crank lever operated by the plunger, and mechanism controlled by said lever for opening the cover.

19. The combination with a conduit-cover, of an opening-button, mechanism controlled thereby for operating the cover, a shaft which is rocked by the operation of said mechanism, arms carried by said shaft, a support carried by the arms, a dog reciprocally mounted on the support, and an independently-mounted closing-button which is raised by said dog.

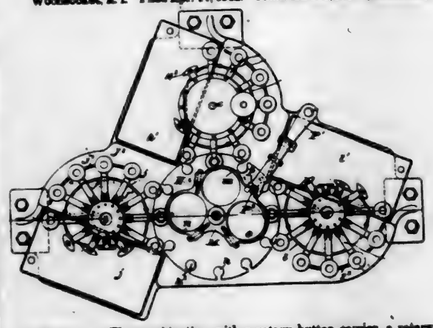
20. The combination with a conduit-cover, an opening-button, a toggle-support therefor which is knuckled to raise the button, mechanism which is operated by the depression of the button to open the cover, a closing-button which is connected to the mechanism so as to be raised thereby, and to operate the mechanism to close the cover when the closing-button is in turn depressed, and a device operated by the mechanism when the latter is actuated by the depression of the closing-button, to unknuckle the toggle.

21. The combination with a conduit-cover, of a button, a toggle-support therefor, means for knuckling the toggle to raise the button, mechanism operated by the depression of the button to open the cover, means for actuating the mechanism to open the cover, a rock-shaft operated by said mechanism, an arm carried by the shaft, a link suspended from the arm and a bell-crank lever actuated by the link to unknuckle the toggle.

22. In a railway of the type described, the combination with a conduit-cover, of a button adapted to be depressed by a car-wheel, mechanism below the roadway for operating the cover, and operating connections between said button and mechanism.

23. In an electric railway of the type described and having an opening at the place desired for the vertical movement of the car-collector, the combination with a cover for the opening, and comprising two parts, of fixed supports, swinging levers pivoted to the cover parts and to said supports, and operating-lever connected to the respective parts of the cover, whereby the latter can be swung back and forth on the swinging levers to open and close the opening in the conduit.

705,084. STENCILING-MACHINE FOR BUTTONS. JOHN HORNBY, Woonsocket, R. I. Filed Apr. 17, 1902. Serial No. 103,414. (No model.)



Claim.—1. The combination with a rotary button-carrier, a rotary stencil-carrier, and stencils thereon overlapping the edge of the button-carrier, of means for rotating the carriers in unison, and means for projecting liquid through the stencil when in position above a button in the button-carrier.

2. The combination with a button-carrier, and a stencil-carrier, of means for moving them intermittently in unison, and means for project-

ing liquid through the stencil when at rest in its position above the button in the carrier.

3. The combination with a button-carrier, and a stencil-carrier, of means for moving them intermittently in unison, a liquid-reservoir, and means for projecting liquid therefrom through the stencil when the stencil is in its position above the button in the reservoir.

4. The combination with a button-carrier, a stencil-carrier, and means for moving them intermittently in unison, of a liquid-reservoir, means for moving it into position over a stencil and button at rest in their carriers, and means for projecting liquid from the reservoir through the stencil in said position.

5. The combination with a button-carrier having button-seats near its edge, a stencil-carrier adjacent to the button-carrier, stencils attached to the carrier projecting over the button-seats, means for intermittently moving the stencils over the button-seats, a liquid-reservoir and means for projecting liquid therefrom through a stencil in position over a button-seat.

6. The combination with a button-carrier and a stencil-carrier secured to parallel shafts, of button-seats near the periphery of the button-carrier, stencils carried by their carrier and projecting over said button-seats, a liquid-reservoir and means for projecting liquid therefrom through a stencil when in position over a button in one of the seats.

7. The combination of a button-carrier, a stencil-carrier and means for causing them to move intermittently in unison to bring a stencil into position over a button, of means for projecting liquid through the stencil when in position and means for cleansing the stencil after each operation.

8. The combination of two parallel shafts, a button-carrier secured to one shaft, a stencil-carrier secured to the other shaft, means for causing the shafts to rotate intermittently in unison, means for holding the shafts at rest when a stencil is over a button, and means for projecting liquid through the stencil while at rest.

9. The combination with a button-carrier, and a plurality of stencil-carriers, of means for intermittently moving all the carriers in unison, a liquid-reservoir for each stencil-carrier, and means for projecting liquid from each reservoir through one of its stencils while in position over a button-carrier.

10. The combination with a button-carrier and a plurality of stencil-carriers, of means for intermittently moving all of the carriers in unison and simultaneously bringing a stencil of each carrier to rest over a button in the button-carrier.

11. The combination with a button-carrier and a plurality of stencil-carriers, of means for intermittently moving all of the carriers in unison and simultaneously bringing a stencil of each carrier to rest over a button in the button-carrier, a liquid-reservoir for each stencil-carrier, and means for simultaneously projecting liquid from the reservoir through each positioned stencil upon its button in the carrier.

12. The combination with a button-carrier provided with a button-seat and a plurality of stencils in line of movement of the seat, of means for intermittently moving the carrier to bring the seat into position consecutively under all of said stencils, and means for projecting liquid through each stencil when in position over a button in the seat.

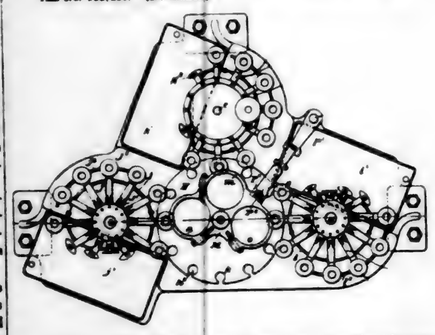
13. The combination with a button-carrier provided with a button-seat and a plurality of stencils in line of movement of the seat, of means for intermittently moving the carrier and the stencils to bring the seat into position consecutively under all of said stencils, and means for projecting liquid through each stencil when in position over a button in the seat.

14. The combination with a vertical shaft, and a button-carrier secured thereto and having button-seats annularly located near its periphery, of a plurality of vertical shafts arranged around the button-carrier shaft, a stencil-carrier secured to each of the surrounding shafts, stencils attached to each carrier equal in number and spaced to correspond in position with the button-seats, means for rotating all the shafts in unison and causing a stencil of each carrier to simultaneously rest in position over a button-rest, and means for projecting liquid simultaneously through all of the resting stencils.

15. The combination with a vertical shaft, a button-carrier secured thereon, a parallel shaft, a stencil-carrier secured thereon, and a notched disk secured to each of said shafts, of a lever pivoted to the frame adjacent to each of said disks, a roller on each lever, springs for normally holding said rollers against the peripheries of the disks, means for intermittently rotating the shafts in unison and means for increasing the tension of the springs during each movement of the disks.

16. The combination with a vertical shaft, a button-carrier secured thereon, a parallel shaft, a stencil-carrier secured thereon, and a notched disk secured on each of said shafts, of a lever pivoted to the frame adjacent to each of said disks, a roller on each lever, springs for normally holding said rollers against the peripheries of the disks, gearing connecting the shafts, a ratchet-wheel on the button-carrier shaft, a pawl-lever pivoted to the frame, a pawl thereon engaging the ratchet-wheel, means for oscillating the pawl-lever, and a bar attached to the pawl-lever and connected to the springs.

705,085. STENCIL-CARRIER FOR BUTTON-STENCILING MACHINES. JOHN HORNBY, Woonsocket, R. I. Filed Apr. 17, 1902. Serial No. 103,415. (No model.)



Claim.—1. In a button-stenciling machine, a stencil-carrier comprising a hub and radial arms or stencil-holders hinged thereto in combination with a button-carrier and a guide-bar for supporting the outer ends of the stencil-holders above the button-carriers.

2. In a button-stenciling machine, a stencil-carrier comprising a hub and radial arms or stencil-holders hinged thereto in combination with a button-carrier having button-seats, means for moving the carriers in unison to bring a stencil in a holder above a button in a seat in the carrier, and a guide-bar for supporting the holder above the button-carrier until the holder reaches a position above the button in the seat.

3. In a button-stenciling machine, a stencil-carrier comprising a hub and radial arms or stencil-holders hinged thereto in combination with a button-carrier having button-seats, means for moving the carriers in unison to bring a stencil in a holder above a button in a seat in the carrier, and a guide-bar for supporting the holder above the button-carrier until the holder reaches a position above the button in the seat, said guide-bar being provided with a notch into which the stencil-holder drops when that position is reached.

4. In a button-stenciling machine, a stencil-carrier comprising a hub, and radial arms or stencil-holders hinged thereto in combination with a button-carrier having button-seats, means for moving the carriers in unison to bring a stencil in a holder above a button in a seat in the carrier, and a guide-bar for supporting the holder above the button-carrier until the holder reaches a position above the button in the seat, said guide-bar being provided with a notch into which the stencil-holder drops when that position is reached, and means for raising the holder out of the notch at the end of its resting period.

5. In a button-stenciling machine, a stencil-carrier comprising a hub and radial arms or stencil-holders hinged thereto in combination with means for rotating the carrier, a guide-bar for supporting the holders during such rotation, said guide-bar being depressed for part of its extent, and a tank for containing liquid through which the stencil-holders travel while passing over the depressed portion of the guide-bar.

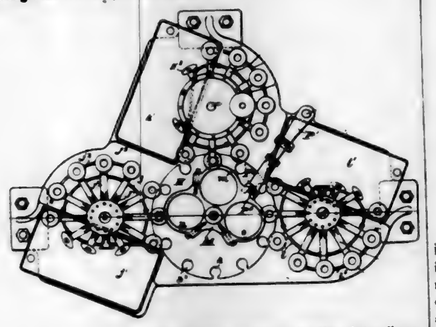
6. In a button-stenciling machine a stencil-carrier comprising a hub having radial openings in its periphery, plugs secured in said openings and stencil-holders consisting of metal plates pivoted on horizontal pins in the outer ends of the plugs, said plates being enlarged at their outer ends to support the stencils.

705,086. PIGMENT-SPRAYING MECHANISM FOR BUTTON-STENCILING MACHINES. JOHN HORNBY, Woonsocket, R. I. Filed Apr. 17, 1902. Serial No. 103,416. (No model.)

Claim.—1. The combination with a button-carrier and a stencil-carrier, and means for rotating them intermittently in unison to bring the stencils above the buttons, of a pigment-reservoir, a carrier above the button-carrier supporting said reservoir, and mechanism whereby the pigment-reservoir carrier is oscillated during each movement and rest of the button-carrier.

2. The combination with a vertical shaft, a button-carrier secured thereto, and a pigment-carrier loosely journaled on the shaft above the button-carrier, of a vertical rock-shaft, a radial arm thereon engaging the pigment-carrier at its outer end, means for intermittently rotating the button-carrier shaft, and means for giving the rock-shaft and arm one complete oscillation during each movement of the button-carrier shaft.

3. The combination with a button-carrier, a stencil-carrier, and means for bringing a stencil in the stencil-carrier in position above a button in the button-carrier, of a pigment-reservoir above the stencil-carrier, means for moving it beyond the button before the stencil is positioned and into position over the stencil when at rest, and means for projecting pigment through the stencil upon the button.



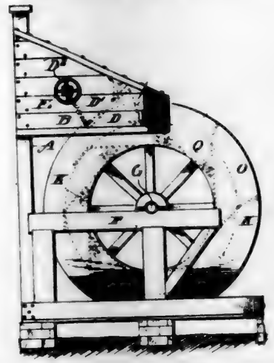
4. The combination with a button-carrier, a plurality of stencil-carriers, and means for positioning a stencil of each stencil-carrier over a button in the button-carrier, of a pigment-reservoir carrier above the button-carrier, means for moving the pigment-reservoirs beyond the button-seats before the stencils are positioned over them and back into position over the stencils when positioned over the button-seats, and means for simultaneously projecting pigment from all the reservoirs through the respective stencils upon the buttons.

5. The combination in a stenciling-machine of a pigment-reservoir in the form of an atomizer or sprayer, an inlet for an air-current thereto, intermittently-moving stencil and button carriers, and means for cutting off the air-current while the carriers are in motion.

6. The combination in a stenciling-machine of a shaft, means for intermittently rotating it, a stencil-carrier on the shaft, a spraying pigment-reservoir above the carrier, and means for bringing the sprayer into action when the stencil-carrier is at rest.

7. The combination in a stenciling-machine of a shaft, means for intermittently rotating it, a stencil-carrier on the shaft, a spraying pigment-reservoir above the carrier, an air-conduit leading to the reservoir, a normally closed escape-valve in said conduit, and a cam on the carrier-shaft timed to open said valve and permit the air to escape while the carrier is in motion.

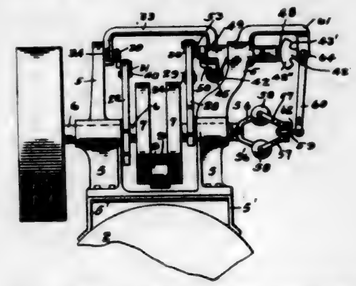
705,087. WATER-WHEEL. JOHN W. HOUTS, Republic, Mo. Filed Mar. 29, 1902. Serial No. 100,563. (No model.)



Claim.—1. An overshot water-wheel having a series of stationary buckets, tubular valves, one positioned in each bucket, and stops for retaining said valves in the buckets, as set forth.

2. An overshot water-wheel having a series of stationary buckets, a space intervening between the inner end of each bucket and the wall of an adjacent bucket, and a tubular valve positioned in each bucket and adapted to close said space while the bucket is being loaded with water, as set forth.

705,088. ENGINE VALVE-GEAR. OLE HOVE, Ripon, Wis. Filed May 6, 1901. Serial No. 58,884. (No model.)



Claim.—1. The combination, with the engine provided with a cylinder, piston, crank-shaft and connecting members, said cylinder having independent inlet and exhaust valves, of a valve-gear comprising throw-rods 34 and 49, means connecting said throw-rods with said inlet and exhaust valves, a yoke connecting said throw-rods, an interposed resistance device, and a governor connected directly with the throw-rod that controls the steam-inlet valve, substantially as described.

2. The combination, with the engine provided with independent inlet and exhaust valves, of the reversing and throw-rod lever 34, the throw-rod 49, a yoke connecting said throw-rods, a governor positively connected with one of said throw-rods, and a resistance device interposed between said throw-rods, for the purpose set forth.

3. The combination, with the engine-boiler, of the cylinder, engine-frame and piston mounted upon said boiler, the center crank-shaft connected with the piston-rod of said engine, the throw-rods 34 and 49, one of said throw-rods being connected with the engine-reversing lever, means connecting said throw-rods through an interposed resistance device, a governor, and means connecting said governor with the throw-rod that controls the steam-inlet valve, for the purpose set forth.

4. The combination, with the engine, provided with a cylinder, piston, and piston-operating parts, and with independent inlet and exhaust valves, of a center crank-shaft, a governor driven by the engine, and variable throw-levers connected with the inlet and exhaust valves, substantially as described.

5. The combination, with the engine provided with the independent inlet and exhaust valves, of the crank-shaft, throw-levers arranged upon opposite sides of said crank, means connecting said throw-levers, and a governor connected with and controlling the lever that operates the inlet-valve, for the purpose set forth.

6. The combination, with the engine provided with independent inlet and exhaust valves, of the center crank-shaft, throw-levers arranged at opposite sides of said center crank, means for simultaneously operating both of said levers, and a governor connected with and adapted to operate independently the throw-rod that controls the inlet-valve, substantially as described.

7. The combination, with the engine provided with independent inlet and exhaust valves, of the center crank-shaft, throw-rods arranged upon opposite sides of said center crank and connected with said inlet and exhaust valves, a lever for operating or reversing simultaneously the position of both of said throw-levers, and a governor connected with and adapted to operate independently the throw-lever that controls the inlet-valve, for the purpose set forth.

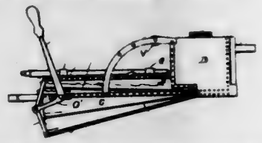
8. The combination, with the engine, provided with independent inlet and exhaust valves, of the crank-shaft 6, the throw-levers 34 and 49, the yoke 33 connected with said levers, an interposed resistance device, and a governor connected with and arranged to operate the throw-lever that controls the inlet-valve, for the purpose set forth.

9. The combination, with the engine and the inlet and exhaust valves, of the throw-levers connected with said valves, the yoke 33 connecting said levers, the interposed resistance device, and a governor connected with the throw-lever that controls the inlet-valve, substantially as described.

10. The combination, with the engine, provided with the independent exhaust-valve, of the reversing and throw lever 34, the connecting-bar 39, the vertically-movable block 31, to which said bar 39 is connected, and the link or rod 40 connecting said block with the exhaust-valve rod, for the purpose set forth.

705,089. DUST-APPLICATOR. TILMAN H. HUNT, Albany, Mo. Filed Apr. 26, 1902. Serial No. 104,803. (No model.)

Claim.—1. The combination of a center board having a rigidly-attached block beneath its front end, a dust-retainer on the forward end thereof provided with an inlet and cap and a block-strip set vertically on its front, a separable sectional tube having connection with the retainer through said block-strip, a port in the front of the retainer near its base and its valve, a port set oppositely in the back of the retainer near its base and its valve, a bellows secured to the upper side of the rear end of the center board having communication with the interior of the retainer through the port at the rear end thereof, a bellows secured to the under side of the rear end of the center board and the portway forming connection between said bellows and the port in the front end of the retainer, the handle and its L pivoted to a side edge of the center board and the oppositely-extended arms having loose-joint connection with the end of said L, a side brace and the straps having loose-joint connection with the opposite ends of said arms and rigid connection with the ends of said brace, the curved metal straps forming connection between the upper rear corners of the retainer and the side edges of the center board, the corresponding openings therein and the handbold and its rod adapted to adjustment in said holes, substantially as described.



2. In a dust-applicator the combination with a center board and an upper and under bellows attached thereto, and the handle and connecting mechanism adapted to expand one bellows and simultaneously contract the other, of a dust-retainer on the forward end of the center board provided with an inlet for receiving and an outlet for expelling the dust, a port and valve at the rear end thereof in proximity to the base having connection with the upper bellows, a port and valve at the front end thereof also in proximity to its base, a downwardly and rearwardly extended portway forming connection beneath the retainer between said port and the under bellows, and a shield rigidly set within the retainer over each valve and back of its spring-arm, substantially as described.

3. In a dust-applicator the combination with the center board, a bellows attached on the top thereof and a bellows attached on the under side thereof, of a handle and an L thereon having pivotal connection at the L angle with an edge of the center board, the oppositely-extended arms having loose-joint connection with the end of the L, the strap across the top of the upper bellows and the strap beneath the bottom of the under bellows, each having loose connection with their respective arms, and the brace at the side of the bellows opposite said arms having rigid connection with the straps to secure opposite simultaneous expansion and contraction of the bellows as the handle is vibrated, substantially as shown and described.

4. The combination in a dust-applicator with the center board, the upper and under bellows and the retainer, of a port in the front end of the retainer near the bottom, the portway backward through the base of the retainer to a connection with the under bellows, a valve within the retainer, a spring-arm to hold said valve in position and close said port, and a shield set against the end of the retainer and above the valve to prevent the dust falling back of the valve into the port, substantially as described.

5. In a dust-applicator in combination with a center board provided with a lateral extension at the back end, concave at its rear edge, a dust-retainer at the front end of said board provided with inlet, outlet and valves, and the necessary manipulating mechanism, of a bellows attached centrally on said center board its base being on a horizontal with the base of the retainer and its front end connected with the back of the retainer its top spaced from said board, a bellows attached to the under side of said board its front end, projected, beneath the retainer and its base board spaced below said center board, and the guards extended longitudinally around each bellows to prevent the leather protruding when filled with air, substantially as described and shown.

6. In a dust-applicator the combination of a center board and a dust-retainer at one end thereof, a bellows on top and beneath said board each of greater width at its rear end than at its front and having valve connection, respectively, with the rear and front ends of said retainer close to the center board, the separable sectional tube for applying the dust, the holders provided for said tube-sections and the means for operating the bellows, substantially as described and shown.

705,090. ADVERTISING DEVICE. CHARLES E. JOHNSON, Malden, Mass. Filed Nov. 15, 1901. Serial No. 82,355. (No model.)

Claim.—1. An advertising device consisting of a flexible resilient board or card bearing upon its outward face the words of the advertising matter, with resonant appliances, as bells, secured on the face of said board or card, each bell provided with a shank and eye which extends through the board or card and secured by a dished disk and a spring-pin or ring, as set forth.

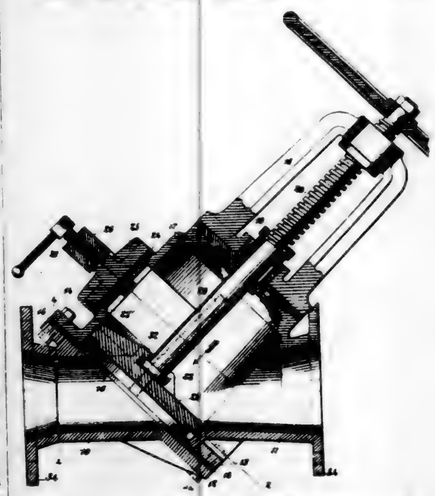
Nebedega Cures

2. An advertising device consisting of a resilient board or card bearing upon its outward face the words of the advertising matter, the said card attached to a suitable support, with resonant appliances, as bells, attached directly to the said board or card, each bell provided with a shank and eye which extends through the board or card, and secured by a resilient disk and a spring-pin or ring, as set forth.

3. An advertising device consisting of a resilient board or card bearing upon its outward face the advertising matter the said card attached to a suitable support, means for vibrating the board or card comprising an electrical circuit-breaker or buzzer upon the back of the board or card, with resonant appliances, as bells, rigidly attached to the said board or card, each bell provided with a shank and eye which extends through the board or card and secured by a resilient disk and a pin or ring, as set forth.

4. An advertising device consisting of a resilient board or card having upon its outward face the words of the advertising matter, the said card attached to a suitable support, means for vibrating the board or card comprising an electrical circuit-breaker or buzzer, with resonant appliances, as bells, rigidly attached to the said board or card, each provided with a shank and eye which extends through the board or card and secured by a resilient disk and a pin or ring, as set forth.

705,091. VALVE FOR WOOD-PULP DIGESTERS. JOSEPH JOULE, Belleville, N. J., assignor to Eastwood Wire Manufacturing Company, Belleville, N. J., a Corporation of New Jersey. Filed May 23, 1902. Serial No. 108,615. (No model.)



Claim.—1. The valve-casing comprising the sections 10 and 11 flanged at their meeting ends and forming the passage for the pulp, and the valve ring or seat 16 held between said flanges, said section 10 forming a horizontal oval in cross-section and at its inner end extending at an angle of about forty-five degrees to the longitudinal plane of said section, combined with the valve-disk and its operating-stem; substantially as and for the purposes set forth.

2. The valve-casing comprising the sections 10 and 11 flanged at their meeting ends and forming the passage for the pulp, and the valve ring or seat 16 held between said flanges, said section 10 forming a horizontal oval in cross-section and at its inner end extending at an angle of about forty-five degrees to the longitudinal plane of said section, and the said section 11 being formed with the section 17 constituting a chamber for the valve-disk and having the opening for the admission of said disk, combined with the valve-disk and its operating-stem; substantially as set forth.

3. The valve-casing comprising the sections 10 and 11 flanged at their meeting ends and forming the passage for the pulp, and the valve ring or seat 16 held between said flanges, said section 10 forming a horizontal oval in cross-section and at its inner end extending at an angle of about forty-five degrees to the longitudinal plane of said section, and the said section 11 being formed with the section 17 constituting a chamber for the valve-disk and having the opening 23 and flanges 27, combined with the plates 24, 25, for said opening, the hooked clamping-frame 26 to pass over said plates and engage said flanges, the binding-screw 28 carried by said frame, and the valve-disk and operating-screw; substantially as set forth.

4. The valve-casing comprising the sections 10 and 11 flanged at their meeting ends and forming the passage for the pulp, and the valve ring or seat 16 held between said flanges, said section 10 forming a horizontal oval in cross-section and at its inner end extending at an angle of about forty-five degrees to the longitudinal plane of said section, and said section 11 having the section 17 for the valve-disk and a circular outer end into which the inner surfaces of said section merge on diverging lines, combined with the valve-disk and its operating-screw; substantially as set forth.

5. The valve-casing comprising the sections 10 and 11 flanged at their meeting ends and forming the passage for the pulp, and the valve ring or seat 16 held between said flanges and being without said passage so as not to obstruct the same, the said section 11 being formed with the section 17 constituting a chamber for the valve-disk and having the opening 23 and closure therefor, combined with the valve-disk, the operating-screw therefor, and the frame mounted on said section 17 for said screw; substantially as set forth.

705,092. SUPERVISORY RELAY. WILLIAM KAISLING, Chicago, Ill., assignor to Kellogg Switchboard and Supply Company, Chicago, Ill., a Corporation of Illinois. Filed Feb. 4, 1901. Serial No. 45,984. (No model.)

Claim.—1. The combination with an electromagnet, of an armature situated opposite the pole thereof, and a mounting for said armature comprising a spring passing across the inner face of said armature and secured at one end to the armature and at the opposite end to a suitable support, substantially as described.

2. The combination with an electromagnet, of an armature situated opposite the pole thereof and adapted to occupy an upright position, of a mounting for said armature comprising a spring passing across the face of the armature and secured at one end to the lower edge of said armature and to a suitable support at the upper end, substantially as described.

3. The combination with an electromagnet and the core thereof, of an inclosing shell of magnetic material, an armature situated opposite the ends of said core and shell and a mounting for said armature comprising a spring passing between the poles of the magnet and the armature and secured at one end to the edge of said armature and at the other end to the end of said shell, substantially as described.

4. The combination with an electromagnet, of an armature situated opposite the pole thereof, and a mounting therefor comprising a spring located between the pole and the armature and having one end inserted in a slot provided near the edge of the armature and having the other end secured to a suitable support, substantially as described.

5. The combination with an electromagnet, of an armature situated opposite the pole thereof, and a mounting therefor comprising a spring placed between the pole and armature and having one end inserted in a slot provided near the edge of said armature the periphery of said armature being prick-punched in the vicinity of said inserted end to secure the same in position, the opposite end of said spring being mounted upon a suitable support, substantially as described.

6. The combination with an electromagnet, of an armature situated opposite the pole thereof, a mounting for said armature comprising a spring passing across the face thereof and secured at one end to the armature and at the opposite end to a suitable support and a pair of contacts one carried upon said armature and the other upon the end of the core of said electromagnet and adapted to be closed together when the armature is attracted, substantially as described.

7. The combination with an electromagnet, of an armature situated opposite the pole thereof, a mounting therefor comprising a spring secured at one end to the armature and at the other end to a suitable support, a pair of contacts one carried upon said armature and the other upon the end of said core, said spring being provided with an opening to permit said contacts to engage when the armature is attracted, substantially as described.

8. The combination with an electromagnet, of an insulating-block mounted upon the end of the core thereof, a contact mounted upon said block, an armature situated opposite the end of said core, a mounting for said armature comprising a spring passing across the face of the armature and secured at one end to the edge of said armature and at the other end to a suitable support and a contact carried upon said armature and adapted to engage the contact on the core when the armature is attracted, substantially as described.

9. The combination with the core of an electromagnet, of a winding mounted on the core, and an insulating-block surrounding the end of said core, an insulating-piece inserted in an opening in the end of said core, a spring secured at one end to said insulating-block and carrying a contact adapted to rest against said insulating-piece, a shell of magnetic material surrounding the winding of said electromagnet, an armature situated opposite the pole of said electromagnet and a mounting for said armature comprising a spring secured at one end to the edge of said armature and at the other end to the end of said shell, substantially as described.

10. The combination with an electromagnet, of an armature situated opposite the pole thereof, a mounting for said armature comprising a strip of metal located between the pole and armature and serving as a spring and secured at one end to the armature and at the opposite end to a suitable support, a contact carried upon said armature, and an electrical circuit adapted to include said contact, the metal of said armature and said spring, substantially as described.

11. The combination with an electromagnet, comprising a core and a winding surrounding the same and a shell of magnetic material surrounding said winding, of a contact carried upon the end of said core, an armature situated opposite the end of said core, a mounting therefor, comprising a spring passing across the face of the armature and secured at one end to the armature and at the other end to the end of said shell, a contact carried upon said armature and adapted to engage the contact on the end of said core, a leading-in conductor mounted upon and electrically connected with the rear end of said shell, and three leading-in conductors passing through and insulated from the end of said shell, two of the same being connected with opposite ends of the magnetic winding and the third being connected with the contact mounted upon the end of said core, substantially as described.

12. The combination with an electromagnet, of an armature situated opposite the pole thereof, and a mounting for said armature comprising a spring secured to said armature and to a suitable support and contained wholly within the periphery of the armature, substantially as described.

13. The combination with an electromagnet and the core thereof, of an inclosing shell therefor, an armature situated opposite the ends of the core and armature, a mounting for the armature comprising a spring-strip extending across the end of the magnet and between the poles thereof and the armature, said strip being confined within the limits of the armature and shell substantially as described.

14. The combination with an electromagnet and the core thereof, of an inclosing shell of magnetic material, an armature situated opposite the ends of said core and shell and a mounting for said armature comprising a spring secured at one end to the edge of said armature and at the other end to the end of said shell, substantially as described.

15. The combination with an electromagnet and the core thereof, of an inclosing shell, an armature situated opposite the ends of said core and shell, and means for permanently securing said armature directly to the shell, substantially as described.

16. The combination with an electromagnet, and a core therefor, of an inclosing shell of magnetic material forming a portion of the magnetic circuit of the magnet, an armature situated opposite the ends of said core and shell and adapted to be attracted thereby, said armature being permanently secured to said shell so as to be carried directly thereby, substantially as described.

17. The combination with an electromagnet and the core thereof, of an inclosing shell, an armature situated in front of the ends of said core and shell, a removable cap fitting upon the end of the shell and adapted to inclose the end of the same and the armature, said armature being mounted independently of the cap, whereby the latter is removable without disturbing the armature in its relation to the shell, substantially as described.

18. The combination with an electromagnet and the core thereof, of

an inclosing shell of magnetic material forming a part of the magnetic circuit, an armature situated opposite the ends of said core and shell, and a mounting for said armature adapted to permit it to move bodily in a right line opposite the poles of the magnet, substantially as described.

19. The combination with an electromagnet and a core therefor, of an inclosing shell of magnetic material, an armature situated opposite the ends of said core and shell and a mounting for said armature comprising a spring of non-magnetic material passing across the inner face of said armature and secured at one end to the armature and at the opposite end to a suitable support, substantially as described.

20. The combination with an electromagnet, of an armature situated opposite the pole thereof, and a mounting for said armature comprising a spring passing across the inner face of said armature and secured at the opposite end to a suitable support, substantially as described.

21. The combination with an electromagnet and the core thereof, of an inclosing shell, an armature situated in front of the ends of said core and shell, means for mounting said armature directly upon the shell, and a removable cap for closing the end of the shell and inclosing the armature, said cap being entirely independent and free from the armature, substantially as described.

22. The combination with an electromagnet and the core thereof, of an inclosing shell of magnetic material forming a portion of the magnetic circuit for the magnet, an armature situated opposite the ends of said core and shell and adapted to be attracted thereby, said armature being directly carried by the shell, and a removable cap for closing the end of the shell and inclosing said armature, said cap being entirely independent and free from the armature, substantially as described.

23. The combination with an electromagnet and the core thereof, of an inclosing shell, an armature situated in front of the ends of said core and shell, a removable cap fitting upon the end of the shell and adapted to inclose the end of the same and the armature, said armature being mounted independently of the cap, whereby the latter is removable without disturbing the armature in its relation to the shell, and an adjustable stop for the armature carried by the cap, substantially as described.

24. The combination with an electromagnet and the core thereof, of an inclosing shell of magnetic material forming a part of the magnetic circuit, an armature situated opposite the ends of said core and shell, a spring-mounting for said armature adapted to permit it to move bodily in a right line opposite the poles of the magnet, and a stop for the armature, substantially as described.

705,093. SET-SCREW PROTECTOR. THOMAS F. KELLEY, Ligonier, Ind. Filed Mar. 6, 1902. Serial No. 96,876. (No model.)

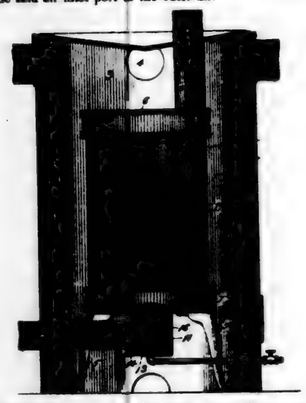
Claim.—1. A set-screw protector consisting of an internally-screw-threaded tubular sheath, open at its lower end and adapted to firmly inclose the protruding portion of said set-screw, and provided with a removable cap adapted to close the upper end of said sheath by a screw-threaded connection, as described.

2. In a set-screw protector, the combination of an internally-screw-threaded tubular sheath open at its lower end and having a flexible portion between the set-screw and the cap when in position, and a removable screw-threaded cap adapted to close the upper end of the sheath, as described.

3. A set-screw protector consisting of a tubular inclosing sheath internally screw-threaded for the purpose specified, and adapted to be secured in an upright position upon the protruding portion of the set-screw by its own elasticity, as described.

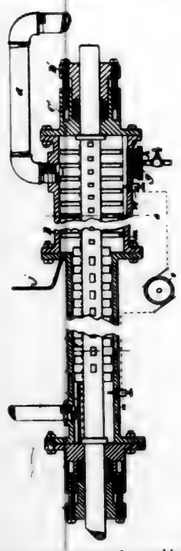
705,094. HEATING APPARATUS. JOSEPH A. KLOER, Piqua, Ohio. Filed Apr. 17, 1901. Serial No. 56,272. (No model.)

Claim.—1. In a heating apparatus of the class described, the combination with the inclosing jacket or casing having means for admitting air therein, of a heater arranged within the jacket or casing and comprising an upright body consisting of spaced upper and lower heating-drums, a plurality of circulating-flues connecting said drums, and a separate tubular fire-chamber communicating at its upper end with the interior of the upper drum and extending entirely through the lower drum, said fire-chamber having an open bottom extension projecting below the plane of the lower drum and receiving therein a burner, the said bottom extension having its lower end open and in direct communication with the interior of the jacket or casing, and also provided above the plane of its bottom opening with an auxiliary air-inlet port, and a fresh-air-supply pipe leading from the said air-inlet port to the outer air.



2. In a heating apparatus, the heater comprising upper and lower spaced drums, a plurality of circulating-flues connecting said drums, a separate central tubular fire-chamber connected at its upper end with the bottom of the upper drum and extending entirely through the lower drum, the lower projecting end of the fire-chamber forming a bottom extension for the fuel and provided with a bottom and side air-inlet openings, a vertically-arranged baffle-partition confined between the upper and lower sides of the upper heat-drum and disposed at one side of the vertical plane of the fire-chamber between opposite sets of the circulating-flues, and separate terminal fastenings detachably connecting diametrically opposite ends of the partition with the rim portion of the drum.

705,095. AMALGAMATOR. PAUL A. KNAPPE, Grantville, Ga., assignor, by mesne assignments, to American Amalgamating Company, a Corporation of Georgia. Filed Mar. 7, 1902. Serial No. 97,085. (No model.)



Claim.—1. In an amalgamator, the combination of a mixing-chamber having a pulp-inlet, means for intermingling the pulp and mercury

therein, a settling-chamber having a less restricted space than the mixing-chamber in communication therewith and adapted to receive the intermingled pulp and mercury therefrom, means in said settling-chamber for circulating and opening up said intermingled mass, a gangue-outlet therefrom and a settling-space therein out of the path of travel of the intermingled pulp and mercury.

2. In an amalgamator, the combination of a mixing-chamber, mixing means therein, a settling-chamber communicating with said mixing-chamber and having less restricted space than said mixing-chamber, so located as to receive the intermingled substances from said mixing-chamber, freeing means therein for aiding the free circulation of the particles of pulp, an outlet for said settling-chamber, said settling-chamber having a settling-space out of the path of travel of the intermingled pulp and mercury, and means to cause the passage of the pulp under pressure through said mixing-chamber, settling-chamber and outlet-passage.

3. In an amalgamator, the combination of a mixing-chamber having a pulp-inlet, mixing means therein, a settling-chamber communicating with said mixing-chamber having a less restricted space than said mixing-chamber and so located as to receive the intermingled pulp and mercury therefrom, said settling-chamber having a settling-space out of the path of travel of the intermingled pulp and mercury, and means for dilating the intermingled pulp and mercury during its passage through the amalgamator to aid the circulation of the same and the separation of the heavier from the lighter particles.

4. In an amalgamator, the combination of a mixing-chamber having a pulp-inlet, means for intermingling the pulp and mercury therein, a settling-chamber having a less restricted space than the mixing-chamber in communication therewith and adapted to receive the intermingled pulp and mercury therefrom, means in said settling-chamber for circulating and opening up said intermingled mass, a gangue-outlet therefrom, a settling-space therein out of the path of travel of the intermingled pulp and mercury, and a source of electricity connected with the interiors of said chambers to cause passage of the current through the intermingled pulp and mercury.

5. In an amalgamator, the combination of a mixing-chamber, mixing means therein, a pulp-inlet therefor, a substantially horizontal settling-chamber communicating therewith and having an outlet for the gangue at the other end thereof, said settling-chamber having a less restricted space than said mixing-chamber and having a settling-space outside the path of travel of the intermingled pulp and mercury and means to dilute the pulp during its passage through the amalgamator.

6. In an amalgamator, the combination of a cylinder, a pulp-inlet therefor, mixing means within said cylinder, a larger, substantially horizontal, stationary cylinder opening therefrom having unobstructed communication and being in substantial alinement therewith, freeing means therein, and an outlet-passage leading from said latter cylinder.

7. An amalgamator comprising distinct mixing and settling chambers in open communication, having respectively distinct mixing and freeing means therein, said settling-chamber having less restricted space than said mixing-chamber and having a settling-space out of the path of travel of the intermingled pulp and mercury, and means for causing the pulp to circulate through said chambers under pressure.

8. An amalgamator comprising distinct mixing and settling chambers in open communication, mixing means in said mixing-chamber, said settling-chamber having less restricted space than said mixing-chamber and having a settling-space out of the path of travel of the intermingled pulp and mercury, means for causing the pulp to circulate through said chambers under pressure, and means for diluting the pulp in its passage.

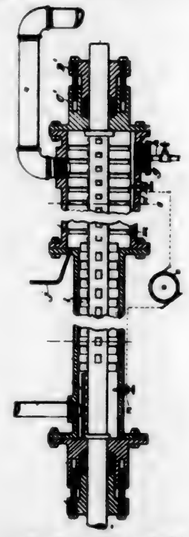
9. In an amalgamator, a closed amalgamating-receptacle having inlet and outlet passages and comprising a mixing-chamber with mixing means therein, and a settling-chamber, of less restricted space than said mixing-chamber, with settling or freeing means therein and having a settling-space out of the path of travel of the intermingled pulp and mercury.

10. In an amalgamator, an amalgamating-receptacle, comprising a substantial horizontal mixing-chamber having mixing means therein communicating with a substantially horizontal stationary settling-chamber, of less restricted space than said mixing-chamber, having settling means therein and a settling-space out of the path of travel of the intermingled pulp and mercury.

11. An amalgamator, comprising a mixing-chamber, a settling-chamber having a less restricted space than said mixing-chamber leading therefrom, and vehicle-fluid-inlet passage near the initial end of said settling-chamber, said settling-chamber having a settling-space outside the path of travel of the intermingled pulp and mercury.

12. In an amalgamator a mixing-chamber, a pulp-inlet therefor, mixing means therein, a horizontal chamber of less restricted space communicating therewith at one end and having an overflow-outlet at the other end, and having a settling-space out of the path of travel of the pulp between the inlet and outlet ends.

705,096. METHOD OF AMALGAMATING METALS. PAUL A. KNAPPE, Grantville, Ga., assignor, by mesne assignments, to American Amalgamating Company, a Corporation of Georgia. Filed Mar. 7, 1902. Serial No. 97,086. (No specimens.)



Claim.—1. The herein-described method for amalgamating metals, which consists in producing a pulp, bringing the same into contact with mercury, enforcing an intermingling of the mercury and the pulp, confining the mixed pulp and mercury within a restricted space during such intermingling, thereafter freeing the intermingled pulp and mercury from said restricted space, separating the heavier particles from the lighter by gravitation in a space less restricted for the circulation of the pulp particles, and preventing further intermingling.

2. The herein-described method for amalgamating metals, which consists in producing a pulp, filling a space with said pulp and with mercury in the presence of pressure, and enforcing an intermingling of the two, placing said filled space in communication with a second space, and permitting the latter to be filled with the intermingled pulp and mercury from the first, also in the presence of pressure, freeing the mixture in said second space from the mixture-enforcing action of the first space, settling the amalgam and mercury in said second space, and carrying off the lighter sand and gangue under the pressure therein.

3. The herein-described method for amalgamating metals which consists in producing a pulp, bringing the same into contact with mercury, intermingling the mercury and pulp within a confined space, freeing the intermingled pulp and mercury from said confined space, opening up and freeing the materials thereof in a space less restricted for the circulation of the pulp particles, separating the heavier particles from the lighter by gravitation, and preventing further intermingling.

4. The herein-described method for amalgamating metals which consists in producing a pulp, bringing the same into contact with mercury, enforcing an intermingling of the mercury and the pulp, confining the mixed pulp and mercury within a restricted space during such intermingling, freeing the intermingled pulp and mercury from said restricted space, diluting the same with liquid, separating the heavier particles from the lighter, and settling the same by gravitation, and preventing the reintermingling of the settled particles.

5. The herein-described method for amalgamating metals, which consists in producing a pulp, bringing the same into contact with mercury, intermingling the mercury and pulp within a confined space, freeing the intermingled mass from said confined space, diluting the intermingled pulp and mercury, opening up the materials in the mass thus freed in a less restricted space, separating the heavier particles thereof by gravitation, and preventing the reintermingling of the settled particles.

6. The herein-described method for amalgamating metals, which consists in producing a pulp, introducing the same into a space containing mercury, said space being such that a slight movement of the pulp particles in certain directions results in contact with the mercury, causing such movement of the pulp as to enforce an intermingling of the same with the mercury, passing the mixed pulp and mercury into a space such

that the pulp particles may move with relative freedom without contact with mercury, opening up the material of the mixture by disturbing the same while in this space, permitting the separation of the heavier particles therefrom by gravitation, and preventing further intermingling.

7. The process of amalgamating metals, which consists in forming a pulp, bringing the same into contact with mercury, enforcing an intermingling of the mercury and the pulp, confining the mixed pulp and mercury within a restricted space during such intermingling, thereafter freeing the mixed pulp and mercury from said restricted space, separating the heavier particles by gravitation in a less restricted space, and causing the passage of an electric current through the intermingled pulp and mercury.

8. The herein-described method for amalgamating metals, which consists in producing a pulp, bringing the same into contact with mercury, agitating the pulp and mercury within a confined space to thoroughly intermingle the same, freeing the intermingled pulp and mercury from said confined space, subjecting the mass to a milder form of agitation in a less restricted space, separating the heavier particles from the lighter by gravitation, and preventing further intermingling of the same.

9. The herein-described method of amalgamating metals, which consists in producing a pulp, passing the same through a confined space containing mercury, intermingling the mercury and the pulp therein, passing the intermingled mercury and the pulp through a less restricted space, opening up the materials thereof, separating by gravitation the heavier particles from the moving mass, and preventing the further intermingling of the same, said passage of the materials through the two spaces being continuous.

10. The herein-described method for amalgamating metals, which consists in producing a pulp, passing the same through a confined space containing mercury, enforcing an intermingling of the mercury and the pulp therein, passing the intermingled mercury and pulp through a less restricted space, separating therein the heavier particles from the lighter by gravitation, settling the same out of the path of the moving mass, and preventing further intermingling of the settled particles.

11. The herein-described method for amalgamating metals, which consists in passing pulp through a restricted space containing mercury, intermingling the two substances therein, passing the intermingled pulp and mercury to a less restricted space, diluting the same with liquid, separating the heavier particles from the lighter by gravitation, and settling said particles out of the line of flow of the moving mass.

12. The herein-described method for amalgamating metals, which consists in producing a pulp, bringing the same into contact with mercury, intermingling the mercury and pulp within a confined space, freeing the intermingled mass from said confined space, diluting the intermingled pulp and mercury with liquid, opening up the materials in the mass thus freed in a less restricted space, separating the heavier particles thereof by gravitation, and settling the same out of the line of flow of the moving mass.

13. The process of amalgamating metals, which consists in forming a pulp, bringing the same into contact with mercury, enforcing an intermingling of the mercury and the pulp, confining the mixed pulp and mercury within a restricted space during such intermingling, thereafter freeing the mixed pulp and mercury from said restricted space, separating the heavier particles by gravitation in a less restricted space, settling the same out of the line of flow of the moving mass, and causing the passage of an electric current through the intermingled pulp and mercury.

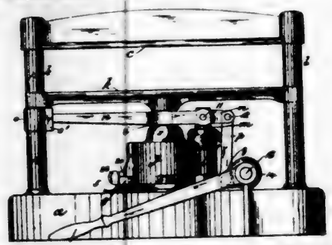
14. The herein-described method of amalgamating metals, which consists in producing a pulp, passing the same through a confined space containing mercury, intermingling the mercury and the pulp therein, causing the intermingled mass to travel in a substantially horizontal direction through a less restricted space, opening up the materials thereof during its passage through said less restricted space, and separating the heavier particles from the lighter by gravitation.

15. The herein-described method for amalgamating metals, which consists in producing a pulp, bringing the same into contact with mercury, enforcing an intermingling of the mercury and the pulp, confining the mixed pulp and mercury within a restricted space during such intermingling, causing the intermingled mass to travel in a substantially horizontal direction through a less restricted space, diluting the same with liquid, separating the heavier particles from the lighter by gravitation, and preventing the reintermingling of the settled particles.

16. The herein-described method of amalgamating metals, which consists in feeding a pulp by gravitation to a confined mercury-containing space, causing the passage of the pulp therethrough by the pressure of the incoming pulp alone, intermingling the pulp and mercury during the passage of the pulp, passing the mixture by the pressure of the incoming pulp through a less restricted space, opening up the materials thereof, separating the heavier particles therefrom, preventing further intermingling of the same, and causing the removal of the lighter sand and gangue by the pressure of the incoming pulp.

17. The herein-described method for amalgamating metals, which consists in causing pulp to travel in a substantially horizontal direction through a mercury-containing confined space, intermingling the pulp and mercury in said space, thereafter causing the intermingled pulp and mercury to travel in a like direction through a less restricted space, opening up the materials of said mixture in said less restricted space, separating the heavier particles from the lighter out of the path of travel by gravitation, and removing the lighter sand or gangue therefrom.

705,097. COPYING-PRESS. ERNEST E. KOKER, St. Louis, Mo. Filed July 30, 1901. Serial No. 69,070. (No model.)



Claim.—1. In a copying-press of the class described, the combination of the base, a fixed platen, a tank containing liquid, a cylinder fixed on the base and containing a piston having its rod connected to the movable platen, a valve opening from the tank into a chamber and a valve opening from the chamber into the said cylinder, a cylinder containing a plunger and having an opening into the said chamber, a lever fulcrumed to a fixed part of the press and coupled to the said plunger, the said lever being adapted to bear against the movable platen, means for vibrating the said lever about its fulcrum, and means for returning the liquid from the cylinder containing the piston, into the tank, substantially as described.

2. In a copying-press of the class described, the combination of the base, a fixed platen, a tank containing liquid, a cylinder fixed to the base and containing a piston, a rod projecting from the piston and connected to the movable platen having the object to be pressed thereon, a valve opening from the tank into a chamber, and a valve opening from the chamber into the cylinder, a lever fulcrumed to a fixed part of the press and adapted to bear against the movable platen, and means for raising the said lever about its fulcrum, substantially as described and for the purpose set forth.

3. In a copying-press of the class described, the combination of a movable platen, a tank containing liquid, a cylinder containing a piston having its rod connected to the said platen, a lever fulcrumed to a fixed part of the press and adapted to raise the said platen, means for admitting the liquid to the cylinder, means for increasing the pressure of the liquid within the cylinder and for releasing the liquid therefrom, substantially as described.

4. In a copying-press of the class described, the combination of the base having a tank or well surrounding a valve-chamber, the said chamber having a removable cover, and a cylinder bearing upon the said cover and having a bottom flange fixed to, and forming a cover to the said tank, substantially as described.

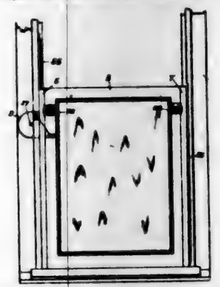
5. In a copying-press of the class described, the combination with the lever *n* of a block *o*, having a projecting hollow portion *o'* and fixed to the upright rod *b*, a hole 16 through the wall of the said portion *o'*, and a spring 17 adapted to engage the said lever, substantially as described.

705,098. WINDOW. PATRICK LALOR, Denver, Colo., assignor of one-half to William T. Lawton, San Francisco, Cal. Filed June 20, 1901. Serial No. 65,220. (No model.)

Claim.—1. In a window, a frame having a guide-plate on one side and a longitudinal recess on the other side, side rails sliding on said guide-plate and in said recess respectively, a sash, pivoted in said side rails to turn horizontally, and means for spreading said side rails when the sash is slightly lifted, whereby one of said rails is forced into said recess, and the sash is free to turn on its pivots, substantially as specified.

2. In a window, a frame having a guide-plate on one side and a longitudinal recess on the other side, side rails sliding on said guide-plate and in said recess respectively, a sash, pivoted in said side rails to turn horizontally, a toothed rack on the side rail adjacent to the guide-plate, a balancing device engaging said toothed rack to counteract the weight of the sash and rails, and means for automatically spreading said side rails away from the sash both at top and bottom when the sash is slightly lifted, whereby one of said rails is forced into said recess, and the sash is free to turn on its pivots, substantially as specified.

3. In a window, a frame having a guide-plate on one side and a longitudinal recess on the other side, side rails sliding on said guide-plate and in said recess respectively, a sash, pivoted in said side rails to turn horizontally, a toothed rack on the side rail adjacent to the guide-plate, a balancing device engaging said toothed rack to counteract the weight of the sash and rails, downwardly-inclined hooks 32 on the sash, and slits 61 in the side rails, with which said hooks engage, whereby when the sash is slightly lifted the sash and rails are spread apart so that the sash is free to turn on its pivots, substantially as specified.



4. In a window, a frame having a guide-plate on one side and a longitudinal recess on the other side, side rails sliding on said guide-plate and in said recess respectively, a sash, tongued and grooved in said side rails and pivoted therein to turn horizontally, a toothed rack on the side rail adjacent to the guide-plate, a balancing device engaging said toothed rack to counteract the weight of the sash and rails, downwardly-inclined hooks on the sash, and slits in the side rails with which said hooks engage, whereby when the sash is slightly lifted the sash and rails are spread apart so that the sash is free to turn on its pivots, substantially as specified.

5. In a window, a pivoted sash and side rails 5 and 7 on which the sash is mounted, the guiding-rail 55 and the clips 54 to connect the side rail 5 to the guide 55 and to the window-frame and cause a true lineal movement thereof.

6. In a window, the combination of the sash 3, side rails 5 and 7, the fastening-hooks 32 to connect the sash and rails, a catch-bolt 45 to lock the sash from upward movement and the withdrawing-lever 49 to release the catch-bolt, operating in the manner described.

7. In a window, a sash pivoted between side rails that slide therewith, inclined hooks 32 to connect the sash and rails, pivots having downwardly-projecting flanges 40, and plates 42 provided with keyhole-shaped sockets 60 with which said pivots engage, whereby the sash is locked in its lower position, and may be turned and sustained in a slightly-raised position, substantially as specified.

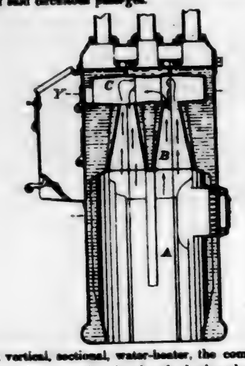
8. In a window, a sash supported at the sides thereof by pivots having downwardly-projecting flanges 40, and plates 42 provided with keyhole-shaped sockets 60 with which said pivots engage, whereby the sash is locked in its lower position, and may be turned and sustained in a slightly-raised position, substantially as specified.

9. In a window, a sash pivoted between side rails that slide therewith, slotted plates 37 on said side rails, inclined hooks 32 to connect the sash and rails, said hooks engaging slots in plates 37, locking-bolts 45, having hook extensions 51, levers 49 engaging said hook extensions to withdraw bolt 45, and lifting-handles 52 on said levers, substantially as specified.

705,099. SECTIONAL HEATER. JAMES G. LAWSON, Newton, Mass. Filed Jan. 24, 1901. Serial No. 44,613. (No model.)

Claim.—1. In a vertical, sectional, water-heater, the combination of front, intermediate and rear tubular sections adapted when assembled and connected to provide a fire-pot and combustion-chamber at the bottom of the heater, a heat-chamber near the top of the heater, a series of vertical passages connecting said combustion and heat chambers and arranged in the longitudinal central plane of the heater, and circuitous passages extending downwardly from said heat-chamber on opposite sides of said central passages, and a smoke or escape flue communicating with the lower ends of said circuitous passages, whereby the products of combustion will be conducted on vertical lines directly to the heat-chamber near the top of the heater from all parts of the combustion-chamber and then downwardly and horizontally from said heat-chamber to the escape-flue.

2. In a vertical, sectional, water-heater, the combination of front, intermediate and rear tubular sections, each having a fire-pot section at its lower end and an enlarged heating-section at its upper end, said enlarged section being interiorly divided by suitable partitions into a central, upwardly-tapering, channel and a series of horizontal flues or chambers on opposite sides of and above said channel, the partitions forming the horizontal flues or chambers of the front and rear sections being out of alinement with each other but alining with the corresponding partitions of the adjacent intermediate section, whereby when the sections are assembled they form a fire-pot or combustion-chamber at the bottom of the heater, a heat-chamber near the top of the heater, a series of tapering flues extending from the fire-pot to said heat-chamber, and circuitous flues or passages extending downwardly from said heat-chamber on opposite sides of the said tapering flues, and an escape-flue communicating with the lower ends of said circuitous passages.



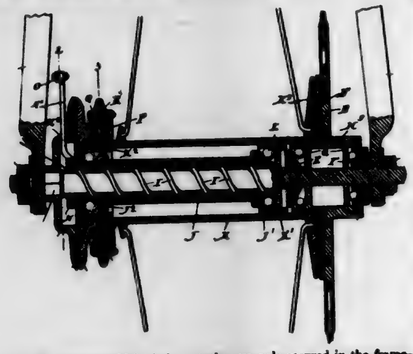
3. In a vertical, sectional, water-heater, the combination of a rear section having a lower portion, forming the back and part of the sides of the fire-pot or combustion-chamber, and an upper, enlarged portion, the interior of said enlarged portion being divided into an upper heat-chamber extending continuously across the section, a central flue or passage extending from the combustion-chamber to said heat-chamber, and chambers on both sides of said central flue, a casing secured to the back of said enlarged portion of the rear section and covering outlet-apertures in the rear walls of all of the chambers therein, said casing having an outlet or escape opening at its upper end and being provided with suitable doors through which access can be had to said casing and the interior passages and chambers of the heater, a front section having a lower portion, forming the front and part of the sides of the combustion-chamber, and an upper, enlarged portion which is interiorly divided to provide a central passage extending from the combustion-chamber to an upper chamber arranged in the plane of the heat-chamber of the rear section, and a series of chambers on both sides of said central passage, the horizontal partitions between said chambers being out of alinement with the horizontal partitions in the rear section, one or more intermediate sections having lower portions forming parts of the sides of the combustion-chamber and upper, enlarged, portions which are interiorly divided to provide in each a central flue or passage extending from the combustion-chamber to a flue connecting the upper chambers of the front and rear sections and a series of horizontal passages on both sides of said central passage, the partitions between said horizontal passages alining with partitions in both the front and rear sections, to provide circuitous passages from the upper heat-chamber to the lower chambers of the enlarged portion of the rear section, and dampers for closing the outlets of chambers in the rear section, the walls and partitions of said sections being hollow to provide a water-passage through the heater.

705,100. COMBINED HUB AND BRAKE FOR MOTOR-VEHICLES. FRANK LE FLEM, Philadelphia, Pa. Filed Feb. 28, 1901. Renewed Dec. 16, 1901. Serial No. 86,084. (No model.)

Claim.—1. In a motor-driven vehicle-hub, a stationary axle secured in the frame of the machine, a motor-driven sprocket-wheel journaled upon said stationary axle independent of the vehicle-wheel, a frictional surface formed upon the inner face of said motor-driven sprocket-wheel, a frictional surface secured rigidly to the opposite end of the stationary axle, a sleeve arranged upon the stationary axle, a barrel or outside shell of the hub journaled upon said sleeve, frictional surfaces formed upon each end of said barrel, and means under the control of the rider for causing said frictional surfaces upon the barrel to evolve in contact with either one of their opposed members, or to remain out of contact with both, substantially as described and for the purpose specified.

2. In a motor-vehicle hub, a stationary shaft secured in the framework of the machine, a motor-driven sprocket-wheel journaled upon said shaft, screw-threads formed upon said stationary shaft, a sleeve threaded upon said screw-threads, means under the control of the rider for revolv-

ing said sleeve, a barrel forming the outside shell of the hub journaled upon said sleeve, a flange secured to the stationary shaft, a flange secured to one end of the barrel and adapted to be brought into frictional contact with the stationary flange, a frictional surface formed upon the motor-driven sprocket-wheel, a flange formed upon the opposite end of the barrel and adapted to be brought in frictional contact with said sprocket-wheel, substantially as described and for the purpose specified.



3. In a motor-vehicle hub, a stationary axle secured in the framework of the machine, a motor-driven sprocket-wheel journaled loosely upon the stationary axle, screw-threads formed upon said stationary axle, a sleeve threaded upon said screw-threads, a barrel constituting the outside shell of the hub, ball-bearings interposed between said barrel and sleeve, means for revolving said sleeve, a flange secured rigidly to the stationary axle, a frictional surface formed upon the inner face of the motor-driven sprocket-wheel, a flange formed upon each end of the barrel, one of said flanges adapted to be brought in frictional contact with the motor-driven sprocket-wheel when the sleeve is revolved in one direction, and the other flange adapted to be brought into frictional contact with the stationary flange upon the opposite end of the axle when the sleeve is revolved in the opposite direction, and the length of the barrel to be such that both of the flanges upon each of its ends can be held out of frictional contact with their opposed members when desired, and a sprocket-wheel adapted to be driven by foot-power secured to the said barrel, substantially as described and for the purpose specified.

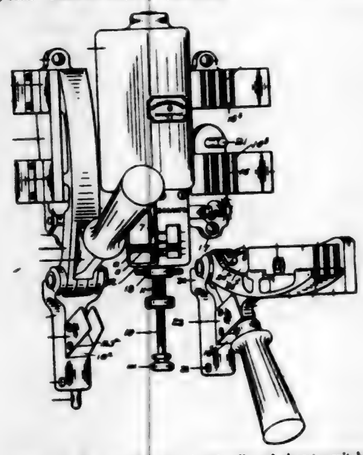
4. In combination in a motor-vehicle hub, a stationary axle secured in the frame of the machine, a motor-driven sprocket-wheel journaled loosely upon said stationary axle, threads formed upon said stationary axle, a sleeve threaded upon said threads, a barrel or outside shell of the hub journaled upon said sleeve, a wrench secured to one end of said sleeve, an arm extending upward from said wrench, a connecting-rod secured to the upper end of said arm, by which the operator is adapted to rock said arm and wrench, and consequently revolve the sleeve in either direction, a friction-brake composed of a stationary and movable member, a stationary member adapted to be secured rigidly to the stationary axle, the movable member adapted to be secured to the barrel, a frictional surface formed upon the inner face of the motor-driven sprocket-wheel, a flange formed with the barrel of the hub and adapted to be brought into frictional contact with said sprocket-wheel, a sprocket-wheel arranged upon the barrel and adapted to be driven by foot-power, an automatic friction-clutch being interposed between said sprocket-wheel and barrel, substantially as described and for the purpose specified.

705,101. CLOTHES-LINE HOLDER. TIMOTHY LEMAIRE, Troy, N. Y., assignor of one-half to George H. Bell, Troy, N. Y. Filed June 24, 1901. Serial No. 65,762. (No model.)

Claim.—1. The combination in a clothes-line holder of a body part B, having the centrally-located and inwardly-extended bow-form projection B², provided with the centrally-located flat surface *b*², having integrally formed with the latter the rivets *d*, *d* and provided with the inwardly-bent ends E', and E², each having the recess R formed on its inner face; the pulley P, mounted to run on the shaft S², between the bent end E' and the body part thereto opposite; and the retaining-spring S', provided with the rivet-passages *n*, *n*, adapted to have entered therein the rivets *d*, *d*, with the latter headed to connect said spring and body part with the ends of the spring each located in one of the recesses R, substantially as, and for the purposes set forth.

2. In a clothes-line holder the combination of the body part B, provided with the centrally-located, inwardly-extended bow-form projection B², having the centrally-located flat surface *b*², provided with integrally-formed rivets *d*, *d*; the inwardly-bent ends E', and E², each having the recess R, on its inner face; the pulley P, mounted to run on the shaft S², between the bent end E', and the body part opposite thereto; the semicircular projections O', formed on the edges of the inwardly-bent end E' opposite the pulley P; the semicircular projections O², formed on the edges of the body part where opposite the pulley; the retaining-spring S', having the rivet-passages *n*, *n*, adapted to receive the rivets *d*, *d*, with the latter thereat headed to connect the spring to the body part, with each of the ends of the spring in one of the recesses R, of the body part, substantially as shown and described.

705,102. ELECTRIC-CIRCUIT BREAKER. HARRY W. LEONARD, New York, and HENRY P. BALL, Mount Vernon, N. Y., assignors, by mesne assignments, to H. Ward Leonard, Bronxville, N. Y. Filed April 4, 1898. Serial No. 676,411. (No model.)



Claim.—1. The combination of a plurality of electric switches designed to be moved manually and independently into normal position, and a single controlling device for automatically controlling the movement of said switches after manual adjustment.

2. The combination of a plurality of electric switches designed to be moved manually and independently into normal position, and a single electroresponsive device for automatically controlling the movement of said switches after manual adjustment.

3. The combination of a plurality of electric switches designed to be moved manually and independently into normal position, and a single electroresponsive device for automatically controlling or effecting the simultaneous movement of said switches after manual adjustment.

4. The combination of a plurality of electric switches designed to be

moved manually and independently into normal position, means tending to open said switches, locking devices for holding said switches in their normal positions, and a single electroresponsive device for automatically releasing said switches.

5. The combination of a plurality of electric switches designed to be moved manually and independently into normal position, means tending to open said switches, locking devices for holding said switches in their normal positions, and a single electroresponsive device for automatically and simultaneously releasing said switches.

6. The combination of a plurality of electric switches, means tending to move same out of normal position, a locking device for holding each of said switches in normal position, an automatic controller for effecting the release of said switches, and means operating to impart a blow to said switches to start same when released.

7. The combination of a plurality of electric switches, means tending to move same independently out of normal position, a locking device for holding each of said switches in normal position, an automatic controller for effecting the release of said switches independently or simultaneously, and means operating to impart a blow to said switches to start same when released.

8. The combination of a plurality of electric switches, means tending to move same out of normal position, a locking device for holding each of said switches in normal position, an electroresponsive device for effecting the release of said switches, and means operating to impart a blow to said switches to start same when released.

9. The combination of a plurality of electric switches, means tending to move same independently out of normal position, a locking device for holding each of said switches in normal position, an electroresponsive device for effecting the release of said switches independently or simultaneously, and means operating to impart a blow to said switches to start same when released.

10. In a circuit-controller, the combination of a plurality of switches adapted to be connected in series in one side of an electrical circuit, means for operating said switches, and one electroresponsive device for controlling the operation of said switches.

11. In a circuit-controller, the combination of a plurality of switches adapted to be connected in series in one side of an electrical circuit, means for operating said switches, and one electroresponsive device for simultaneously controlling the operation of said switches.

12. In a circuit-controller, the combination of a plurality of switches adapted to be connected in series in one side of an electrical circuit, means for operating said switches, independent means for holding each switch closed under normal conditions, and one electroresponsive device operating under abnormal conditions to effect the release of said switches.

13. In a circuit-controller, the combination of a plurality of switches adapted to be connected in series in one side of an electrical circuit, means for operating said switches independently, and means common to each of said switches operating under abnormal conditions in the circuit to cause one or all of said switches when closed to open automatically upon the completion of the circuit.

14. In a circuit-controller, the combination of a plurality of switches adapted to be connected in series in one side of an electrical circuit, means for operating said switches independently, independent means for maintaining each switch closed under normal conditions, and an electroresponsive device operating under abnormal conditions in the circuit to cause the release of one or all of said switches when closed to open automatically upon the completion of the circuit.

15. In an automatic circuit-breaker, the combination of two independent switches electrically connected in series, and a single means opening both switches when the current in the circuit exceeds a predetermined maximum.

16. An electric-circuit breaker having in combination an arm carrying loosely-mounted contact-blades, a stationary slotted contact having rigid walls between which said blades are adapted to enter, said arm being actuated to fly forward through spring-pressure, a latch for holding said arm in the normal position, and means for releasing said latch.

17. An electric-circuit breaker having in combination an arm carrying loosely-mounted contact-blades, a stationary slotted contact having rigid walls between which said blades are adapted to enter, said arm being actuated to fly forward through spring-pressure, a latch for holding said arm in the normal position, and an electroresponsive device operating under abnormal conditions to disengage said latch.

18. An electric-circuit breaker having in combination an arm carrying loosely-mounted contact-blades, a stationary slotted contact having rigid walls between which said blades are adapted to enter, said arm being actuated to fly forward through spring-pressure, a latch for holding said arm in the normal position, a device for imparting a blow to said arm when the latch is disengaged, and an electroresponsive device operating under abnormal conditions to disengage said latch.

19. In an electric switch, the combination of a stationary slotted contact member, and a movable member having one or more blades adapted to enter said slots, each blade comprising a plurality of loosely-mounted contact-plates with spreading devices between them.

20. In an electric switch, the combination of a stationary slotted contact member, and a movable member having one or more blades adapted to enter said slots, each blade comprising a plurality of loosely-mounted flexible contact-plates with spreading devices between them.

21. In an electric switch, the combination of a stationary slotted contact member, and a movable member having one or more blades adapted to enter said slots, each blade comprising a pair of loosely-mounted contact-plates with a spreading device between each pair of plates.

22. In an electric switch, the combination of a stationary slotted contact member, and a movable member having one or more blades adapted to enter said slots, each blade comprising a pair of loosely-mounted flexible contact-plates with a spreading device between each pair of plates.

23. In an electric-circuit breaker such as described, the contact-making parts consisting of loosely-mounted blades with spreading devices between them, and slotted metal blocks for the blades to enter, in combination with an electroresponsive means to open said contacts.

24. The combination of arms having contact-blades loosely mounted thereon, the blades being arranged in pairs with spreading devices between them, slotted blocks or parts for the blades to enter, two blades in each slot, and automatic means for withdrawing the blades from the slots simultaneously, as described.

25. The combination of pivoted arms having contact-blades loosely mounted thereon, the blades being arranged in pairs with spreading devices between them, slotted blocks or parts for the blades to enter, two blades in each slot, and electroresponsive means controlling the withdrawal of the blades from the slots simultaneously, as described.

26. The combination of pivoted arms having contact-blades loosely mounted thereon, the blades being arranged in pairs with spreading devices between them, slotted blocks or parts for the blades to enter, two blades in each slot, and electromagnetic means controlling the withdrawal of the blades from the slots simultaneously, as described.

27. A circuit-breaker of the character herein described, consisting of three independent parts, namely, two independently-operated switches or switch members, and an electroresponsive device for controlling said switches simultaneously or independently of each other.

28. A circuit-breaker of the character herein described, consisting of three independent parts, namely, two independently-operated switches or switch members adapted to be connected in series between a source of energy and a translating device, and an electroresponsive device for controlling said switches simultaneously or independently of each other.

29. In an automatic circuit-breaker, the combination of one or more stationary contact members, a movable spring-actuated switch member, a spring-actuated operating-handle for closing the switch, a locking device for holding the operating-handle in the closed position of the switch, an electroresponsive device for controlling said locking device to release the operating-handle, and means on said operating-handle whereby upon its release a blow will be imparted to the switch to facilitate the opening movement of the switch.

30. In an automatic circuit-breaker, the combination with the stationary and movable contact members, of a pivoted and independently-movable operating-handle for moving the movable switch member to its closed position, a spring placed under tension by the closing movement of the operating-handle and tending to drive the operating-handle to its initial position, a catch for holding said operating-handle against the pressure of said spring, electroresponsive means for automatically releasing said operating-handle, and means on said operating-handle whereby when the handle is released the movement imparted to it by the spring will first impart a blow to the movable switch member and then effect the opening of the switch.

31. In an automatic circuit-breaker, the combination with the stationary and movable contact members, of a pivoted and independently-movable operating-handle for moving the movable switch member to its closed position, a spring placed under tension by the closing movement of the operating-handle and tending to drive the operating-handle to its initial position, a catch for holding said operating-handle against the pressure of said spring, a second spring placed under tension by the closing movement of the movable switch member and tending to drive said member away from the stationary contacts, electroresponsive means for automatically releasing said operating-handle, and means on said operating-handle whereby when the handle is released the movement imparted to it by its spring will first impart a blow to the movable switch and the combined action of both springs will effect the final opening of the switch.

32. A multipolar circuit-breaker, comprising a number of switches, each of which is capable of independent operation to open or close a circuit, and automatic means for opening all of the switches.

33. In a multipolar circuit-breaker, the combination of a number of switches, each of which is capable of independent operation to open or

close a circuit, with a common tripping device acting to open all of the circuits, and a coil controlling the action of the trip.

34. In a circuit-breaker, the combination of a number of switches in different leads or wires, each capable of independent operation, with an overload or series coil, an armature, and a device actuated by the armature for simultaneously releasing all of the switches to open their circuit, leaving them free to close the circuit successively or simultaneously, as may be desired.

35. In a double-pole circuit-breaker, the combination of two switches having no mechanical connection, one in each side of the circuit, automatic means for simultaneously opening the switches at desired times, and means permitting their closure successively or simultaneously.

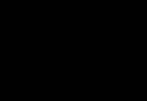
36. The combination of two independently-operated switches in the two sides of a circuit, a tripping device for each switch, an armature for simultaneously actuating both tripping devices, and a series coil in one side only of the line.

37. The combination, with an electric circuit, of two circuit-breakers responsive to the same load connected with opposite sides of the circuit and located adjacent to one another, and magnetic means responsive to a predetermined variation of current strength, for opening the circuit at one circuit-breaker if a current variation exists when the other is closed.

38. In an automatic circuit-breaker, two circuit-interrupting devices in series relation, provided with independent means of operation and adapted for inclusion in an electric circuit so as to be under the control of the same operator, each circuit-interrupting device being automatically responsive to the same predetermined increase of current strength, whereby the circuit will be opened at one point if an overload exists when it is closed at the other point.

39. The combination with an electric circuit, of two automatic magnetic circuit-breakers connected in series relation, provided with independent closing means and placed in proximity to one another, each circuit-interrupting device being responsive to a determinate variation of current strength, whereby the circuit will be opened at the switch of the circuit-breaker if a determinate strength of current exists when the other is closed.

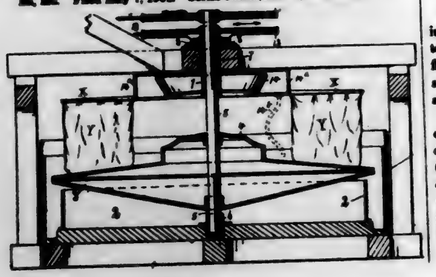
705,103. BOTTLE-CLOSURE. EDWARD A. LEVINE, Duryea, Pa., assignor of two-thirds to the Gunnerton Glass Mfg. Company. Filed July 16, 1901. Serial No. 68,493. (No model.)



Claim.—1. In a bottle-closure of the kind described having a shank extending into the neck of the bottle, a projection above the neck of the bottle, a grasping-flange and gasket centrally located, and a central passage extending through lengthwise of the said closure, in combination with a stopper insertible and removable from the inner end of the central passage, and a curved spout insertible and removable from the outer end of said central passage, all arranged for joint operation, substantially as and for the purpose specified.

2. A bottle-closure of the kind described, comprising a threaded shank extending into the neck of the bottle, a spout projecting above the neck of the bottle, a grasping-flange and gasket centrally located, and a central passage extending through lengthwise of said closure, in combination with a stopper insertible and removable from the inner end of said central passage when the closure is removed, the central gasket arranged to complete the closure when the threaded shank is screwed into the neck of the bottle, substantially as specified.

705,104. ORE WASHER AND SEPARATOR. JAMES M. LOGSDON, Empire City, Kans., assignor of nine-sixteenths to E. V. Wyandotd, Joplin, Mo. Filed May 7, 1901. Serial No. 59,159. (No model.)



Claim.—1. In an ore washer and separator, the combination of a tank, a revolvable vertically-movable float-table therein, a drum on said table and means to discharge sludge onto said drum, substantially as described.

2. In an ore washer and separator, the combination of an outer tank of telescopic construction, and an inner tank therein, a vertically-movable revolvable float-table disposed in said tank and means to discharge sludge onto said float-table, substantially as described.

3. In an ore washer and separator, the combination of a tank, a revolvable vertically-movable float-table therein, a shaft carrying said table, a sleeve-bearing in which said shaft rotates and is adapted to move vertically, said sleeve-bearing being revolvable independently of said table, and a feed-hopper carried by said independently-revolvable sleeve-bearing, substantially as described.

4. In an ore washer and separator, the combination of a water-tank having a discharge-gate on one side, a revolvable vertically-movable float-table in said tank, a feed-hopper revolvable independently thereof, a sweep connected to and carried by said feed-hopper, said sweep being adapted to operate on said table, for the purpose set forth, means to raise and lower said sweep, and means to adjust the same, substantially as described.

705,105. CLAMP FOR LEATHER-SETTING FRAMES. JOSEPH T. LITZEN, Cramlynne, Pa. Filed Oct. 9, 1901. Serial No. 78,095. (No model.)

Claim.—1. In combination, constituting a "setting-frame" for enameling skins of leather, a skeleton frame, a series of adjustable clamp-holding devices secured to the frame edges, and a corresponding series of skin-clamping devices consisting essentially of a pair of normally open clamping members with means to cause said members to close upon each other on the application of a pulling force to one of them, said members being so arranged relatively to each other as to face outwardly whereby the bite on the edge of the skin will bring the clamping device wholly beneath the main body of the skin.

2. A "setting-frame" adapted to grasp the folded-under edge of a skin to be held taut, comprising in combination an adjustable skin-clamping device consisting of a pair of normally open clamping members constituting a pair of jaws facing outwardly, and adapted to close upon each other by an outward-sliding movement of one of them relatively to the other, an actuating-arm on the movable member, adjustable means for applying a moving force to said arm, and a skeleton frame to the edge of which said adjustable actuating means is secured.

3. An adjustable clamping-clip for a "setting-frame" of the character described, consisting of a member A composed of guiding portion *c*, *d*, and inclined face *f*, and member B adapted to slide in said guiding portion of the opposite member, said member B having a handle end inclined at *g*, and perforated at its extremity, substantially as described.

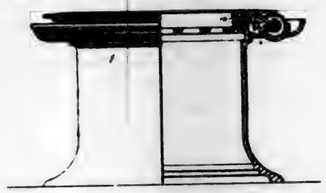
705,106. GEARING FOR BICYCLES. DONALD MACDONALD, Orroroo, South Australia, Australia. Filed Sept. 16, 1901. Serial No. 75,052. (No model.)

Claim.—1. The combination with a driven axle and a barrel forming the center of a wheel and having a flange intermediate its ends; of a toothed wheel-hub bearing on said axle and secured centrally of said flange, and planet-gear on each side of said hub driven by the axle and arranged to drive the hub and thereby drive the barrel and wheel, substantially as herein described.

2. The combination with a crank-axle, two saucer-shaped disks secured thereto, oppositely-situated planet-wheels revolubly mounted on each disk, a fixed crown-wheel on each end of the crank-axle in which the latter is revolubly supported, of a changeable wheel-hub between the disks on the axle and having a cog-wheel formed on each end, a pair of planet-wheels adapted to mesh with each cog and crown wheel, a barrel inclosing all of the aforesaid elements and a web centrally and rigidly connecting the hub and barrel, substantially as herein described.

3. The combination with a driven axle and a barrel forming the center of a wheel and having an internal flange intermediate its ends; of a removable, toothed wheel-hub having bearing on the axle and secured centrally of said flange, and planet-gear on each side of the web, driven by the axle and arranged to drive said hub and thereby drive the barrel and wheel, substantially as herein described.

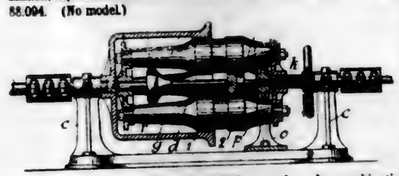
705,107. HAT-FORMING MACHINE. JOHN MARSHALL, Fall River, Mass. Filed Apr. 24, 1901. Serial No. 57,220. (No model.)



Claim.—1. In a hat-forming machine provided with a revolving turn-table, a supporting-frame and spherical balls operating in a circular annular channel between them to support said table and on which it revolves, the combination therewith of a worm-wheel bolted to the under side of the turn-table, and a worm attached to the supporting-frame for actuating said turn-table, and mechanism for operating the worm substantially as described and shown.

2. In a hat-forming machine the combination with a revolving turn-table and a supporting-frame having a circular annular passage arranged between them of a flange depending from the inner circle of the turn-table, and bearing against the inner face of the supporting-frame, assisting to preserve the registry of the two parts of the circular passage, and closing the horizontal aperture between them on the inner side of the machine, substantially as described and shown.

705,108. SPEED-CHANGING FRICTION-GEARING. OSCAR MARTH, Also Lieszko, Austria-Hungary. Filed Jan. 2, 1902. Serial No. 88,094. (No model.)



Claim.—1. In a speed-changing friction-gearing, the combination with the two shafts, arranged in a line, of an annular friction-wheel secured to the shaft which is to revolve slower, a solid friction-wheel, secured to the other shaft and located outside the plane of the annular wheel, a spheroidal roller journaled in the ends of the two shafts, a frame loosely surrounding the shafts, means for preventing the said frame from turning around the shafts, and a number of elongated rollers journaled in radial slots of the said frame, one of the two parts—frame or spheroidal roller—being endwise movable, and each of the rollers journaled in the frame having two cylindric working surfaces adapted to engage the annular and ordinary friction-wheels and a conical end adapted to engage the spheroidal roller, substantially as and for the purpose described.

2. In a speed-changing friction-gearing, the combination with the two shafts, arranged in line, of an annular friction-wheel secured to one shaft, a disk-shaped friction-wheel, secured to the other shaft, without the plane of the annular wheel, a spheroidal roller journaled in the ends of the two shafts, a frame in the shape of a lantern-wheel loosely mounted to the line of shafting and adapted to move endwise, means for preventing said frame from revolving, a tubular screw loosely mounted upon the shaft carrying the solid friction-wheel and engaging a tapped hole of the lantern-wheel-shaped frame, means for turning this screw in either direction, and a number of elongated rollers journaled in radial slots of the said frame, each roller having two cylindric working surfaces adapted to engage the annular and disk-shaped friction-wheels, and having a conical end adapted to engage the spheroidal roller, substantially as and for the purpose described.

705,109. METHOD OF REDUCING COPPER MATTE TO REFINED COPPER. GUSTAV HYBINETTE, Bisbee, Ariz. Filed Sept. 6, 1901. Serial No. 74,622. (No specimens.)

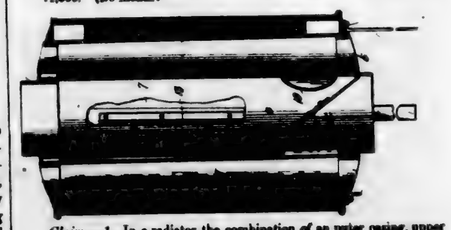
Claim.—1. The method of reducing copper matte to refined copper consisting in charging molten copper matte into a converter and blowing air through the charge until practically all of the iron in the charge has been converted into slag, removing the slag, then reblowing the charge and reducing it to metallic copper and continuing the blowing operation until the charge has been overblown sufficiently to produce a small percentage of suboxid of copper and approximating as nearly as is possible the amount required to prepare the copper for "poling," then charging the molten contents of the converter into a reverberatory furnace and subjecting it to the poling process, substantially as set forth.

2. The method of reducing copper matte to refined copper consisting in blowing copper matte in a converter until practically all the iron contained in the charge has been transformed into slag, removing the slag, then blowing the remaining charge until it has been reduced to metallic copper and continuing the blowing operation until the metallic copper has been sufficiently overblown to produce a small percentage of suboxid of copper and approximating as nearly as is possible the amount required to prepare the copper for "poling," pushing the tuyeres during the blowing of the charge to maintain a constant and practically uniform distribution of air throughout the charge; then charging the molten contents of the converter into a reverberatory furnace and subjecting it to the "poling" process, and finally casting the product into pigs, bars or anodes, substantially as set forth.

3. The method of reducing copper matte to refined copper consisting in reducing copper matte in a converter to metallic copper containing a small percentage of suboxid of copper and approximating as nearly as is possible the amount required to prepare the copper for "poling;" charging a reverberatory furnace with two or more of such converter charges and subjecting such mixed and accumulated charges to the poling process, substantially as set forth.

4. The method of reducing copper matte to refined copper consisting in blowing the copper matte in a converter and reducing it to metallic copper containing a small percentage of suboxid of copper, charging two or more such converter charges into a reverberatory furnace, and then adding to such accumulated charge, one or more additional converter charges blown to such a predetermined condition that when mixed with the accumulated charges they will cause the mass to contain the desired percentage of suboxid of copper and finally subjecting the entire charge to the poling process, substantially as set forth.

705,110. RADIATOR. EMIL MORITZ, LOUIS H. FRYMIRE, and SANFORD KOONS, Watsontown, Pa. Filed Aug. 6, 1901. Serial No. 71,099. (No model.)



Claim.—1. In a radiator, the combination of an outer casing, upper and lower heads removably mounted therein and provided with circular lines of openings, the openings of the upper head being smaller than those of the lower head, thimbles fitted in and projecting inwardly from the openings of the said heads, vertically-disposed ducts removably engaging the inwardly-projecting thimbles and regularly converged their full lengths from the lower ends thereof to the top ends, an enlarged pipe-section vertically disposed in the center of the radiator and fully open at both ends, the lower portion of the said pipe-section having opposite diametrically-disposed, enlarged openings, an oval damper adjustably entering with said openings, and diametrically-disposed partitions in the radiator between the pipe-section and the casing, said partitions extending upwardly almost the full length of the radiator and dividing the latter into two halves.

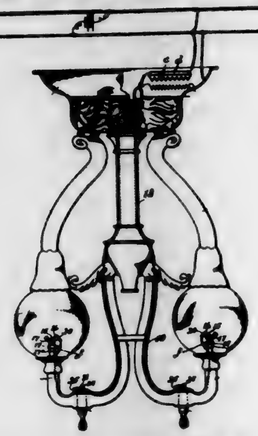
2. In a radiator, the combination of an outer casing, upper and lower heads removably mounted therein, a centrally-disposed pipe-section opening through the heads and having lower openings therein and a damper, ducts vertically disposed in the casing and fully opening through the said heads, the said ducts being regularly converged their full lengths from the lower to the top ends thereof, all the ducts converging in the same direction and removably attached to said heads, and dividing-partitions in the device between the pipe-section and the casing.

3. In a radiator, the combination of an outer casing, a smoke-pipe extending through said casing and having oppositely-disposed openings in the lower end thereof, a damper disposed obliquely in the lower end of said pipe between said openings, and dividing-partitions disposed in

said casing at diametrically opposite points, said partitions extending from the bottom to a point near the top of the said casing.

4. In a radiator, the combination of an outer casing provided with a series of openings at its opposite ends, vertical pipes or flues disposed in said casing and adapted to register at their opposite ends with the openings in the end of said casing, dividing-partitions disposed in said casing between said pipes at diametrically opposite points, said partitions extending to a point near the top of said casing, a smoke-pipe extending through said casing and having oppositely-disposed openings in the lower end thereof, and a damper disposed obliquely in the lower end of said smoke-pipe between said openings, whereby the smoke-pipe may be alternately placed in communication with the casing on opposite sides thereof.

705,111. **ELECTRIC GAS-IGNITING DEVICE.** JOHN A. MOSHER, Chicago, Ill., assignor to the Adams & Westlake Company, a Corporation of Illinois. Filed July 23, 1901. Serial No. 69,468. (No model.)



Claim.—1. In an electric gas-igniter, in combination, a pair of stationary electrodes, a contact-piece, a gas-cock, and a wiper moved by the cock for making and breaking an electric circuit with the contact-piece and inducing a spark at the electrodes, the engaging face of the wiper being beveled in order to facilitate its passage across the contact-plate.

2. In an electric gas-igniter, in combination, a pair of stationary electrodes, a contact-plate, a gas-cock, a wiper secured to and moved with the cock for making and breaking an electric circuit with the contact-plate and inducing a spark at the electrodes, and means for preventing the sparking of the igniter when the gas is being turned off.

3. In an electric gas-igniter, in combination, a burner-tip, a pair of stationary electrodes located adjacent to the gas-orifice of the burner-tip, a gas-cock, a curved contact-plate located in proximity to the cock and concentrically thereto, a wiper carried by the cock for making and breaking an electric circuit with the contact-plate and inducing a spark at the electrodes, and means for preventing the sparking of the igniter when the gas is being turned off.

4. In an electric gas-igniter, in combination, a burner-tip, a pair of stationary electrodes located adjacent to the gas-orifice of the burner-tip, a gas-cock, an insulated resilient contact-plate, a wiper carried by the cock, a projection of the contact-plate extending inwardly toward the cock and in the path of the wiper for making and breaking therewith an electric circuit and inducing a spark at the electrodes, and an insulating strip or block secured to the under face of the projection of the contact-plate against which the wiper is moved when the gas is being turned off.

5. In an electric gas-igniter, in combination, a pair of stationary electrodes, a contact-piece, a gas-cock, a wiper moved with the cock for making and breaking an electric circuit with the contact-piece and inducing a spark at the electrodes, and an insulating strip or block secured to the contact-piece and disposed in the path of the wiper and with which the wiper engages in closing the cock.

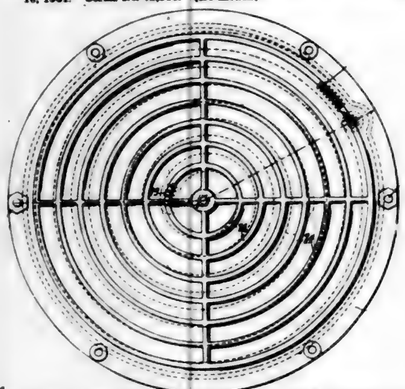
6. In an electric gas-igniter, in combination, a pair of stationary electrodes, a contact-plate, a gas-cock, a wiper actuated by the cock, a projection of the contact-plate in the path of the wiper for making and breaking therewith an electric circuit and inducing a spark at the electrodes, and an insulating strip or block secured to the under face of the projection of the contact-plate with which the wiper engages in closing the cock.

7. In an electric gas-igniter, in combination, a gas-burner, means located at the burner for igniting gas issuing therefrom, a contact-plate, a gas-cock, a wiper moved with the cock for making and breaking an electric circuit with the contact-plate, and an insulating-block secured to the contact-plate and disposed in the path of the wiper and with which the wiper solely engages in closing the cock.

8. In an electric gas-igniter, in combination, a gas-cock, an electric circuit, and a circuit-breaker actuated by the cock and comprising a movable member having faces oblique to its path and a resilient member having insulating material upon one face, and lying across the path of the movable member.

9. In an electric gas-igniter, in combination, a gas-cock, an electric circuit, and a circuit-breaker comprising two members, one being carried by the cock and the other being fixed and crossing the path of the movable member, one of said members being oblique to the path of the movable member, one of said members being resilient, and one of said members having one of its contact-faces formed of non-conductive material.

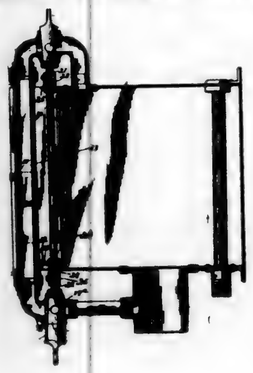
705,112. **RHEOSTAT.** JOHN A. MOSHER, Chicago, Ill. Filed Aug. 16, 1901. Serial No. 72,300. (No model.)



Claim.—1. In a rheostat, in combination, a plate having one face spirally grooved, a refractory lining for the groove, an electric conductor seated in the groove, a binding-post to which each end of the conductor is connected, a filling of non-conducting refractory material covering and submerging the conductor, and a covering-plate secured to the first-named plate.

2. In a rheostat, in combination, a plate having one face spirally grooved, a refractory lining for the groove, a spirally-wound electric conductor seated in the groove, a binding-post to which each end of the conductor is connected, a filling of non-conducting refractory material covering and submerging the conductor, and a covering-plate secured to the first-named plate.

705,118. **SAFETY DEVICE FOR WATER-GAGES.** JOHN A. MOSHER, Chicago, Ill., assignor to the Adams & Westlake Company, a Corporation of Illinois. Filed Oct. 25, 1901. Serial No. 79,857. (No model.)



Claim.—1. In combination, a tank, a transparent gage-tube, means for obscuring the gage-tube and means for cutting it off from the tank, and means for simultaneously exposing the gage-tube to view and for opening its connection with the tank.

2. In a safety device for water-gages, in combination, a tank or other receptacle, a gage-glass, connection between the tank and the glass, a valve in the connection, an obscuring-shield in front of the glass, and means for moving the shield away from in front of the glass when the valve is opened.

3. In a safety device for water-gages, in combination, a tank or other receptacle, a gage-glass, connection between the tank and the glass, a valve in the connection, a shield in front of the gage-glass, connection between the valve and the shield, and means for holding the valve normally closed and the shield in front of the gage-glass.

4. In a safety device for water-gages, in combination, a tank or other receptacle, a gage-glass, connections between the gage-glass and the tank, a valve in each of said connections, means for moving the valves simultaneously, an obscuring-shield normally in front of the gage-glass, and means for moving the shield when the valves are opened.

5. In a safety device for water-gages, in combination, a tank or other receptacle, a gage-glass, connection between the upper and lower ends of the tank and the gage-glass, a valve in each of said connections, means for moving the valves simultaneously, a spring holding the valves normally closed, a shield in front of the gage-glass, and a connection between the valves and the shield.

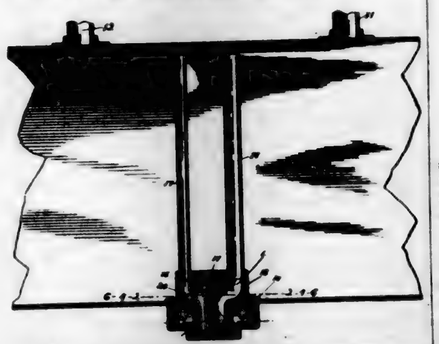
6. In a safety device for water-gages, in combination, a tank or other receptacle, a gage-tube, connections between the upper and lower ends of the tank and the tube, a valve in each of said connections, a rod connecting the two valves, a spring holding the valves normally closed, an apertured tubular shield inclosing the gage-tube and comprising a pair of telescoping sections, and a gear connection between the rod and the shield.

7. In a safety device for water-gages, in combination, a tank or other receptacle, a gage-glass, connections between the upper and lower ends of the gage-glass and the tank, a valve in each of said connections, connection between the valves, and a spring for holding the valves normally closed.

8. In combination, a tank and a transparent gage-tube therefor, a shield, a valve for closing communication between the tank and the gage-tube, means for holding the shield so as to obscure the gage-tube and for holding the valve closed, and means for simultaneously moving the shield to bring the gage-tube into view and for opening the valve.

9. The combination with a transparent water-gage, of an obscuring-shield removably covering the gage, a valve for closing the gage, and operative connection between the valve and the shield.

705,114. **GAS-STORAGE TANK.** JOHN A MOSHER, Chicago, Ill., assignor to the Adams & Westlake Company, a Corporation of Illinois. Filed Oct. 25, 1901. Serial No. 79,868. (No model.)



Claim.—1. In a valve, in combination, a valve-casing having a pair of ports, a valve-plug having a pair of ports so placed as to simultaneously communicate with the ports in the casing, a third port in the casing and which registers with one of the ports in the valve-plug when the latter port is out of communication with one of the pair of ports in the casing, and a cavity in the valve-plug designed to bring one of the pair of ports in the casing into communication with the said third port.

2. In a valve, in combination, a valve-casing having a pair of ports, a valve-plug having a pair of ports so placed as to simultaneously communicate with the ports in the valve-casing, and a third port in the casing so located as to register with one of the ports in the valve-plug when the latter is out of communication with one of the pair of ports in the casing.

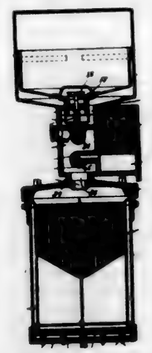
3. In combination, a gas-tank having an induction-port, a valve-casing in the bottom of the tank and having a pair of ports leading to the top thereof and a second pair of ports opening at the bottom of and within the tank, and a rotatable valve-plug in the casing and having a pair of externally-opening ports so placed that their inner ends will register with either of said pairs of casing-ports.

4. In combination, a gas-tank having an induction-port, a valve-casing in the bottom of the tank and having a pair of ports leading to the top thereof and a second pair of ports opening at the bottom of and within the tank, and a rotatable valve-plug in the casing and having a pair of externally-opening ports so placed that their inner ends will register with either of said pairs of casing-ports, the valve-plug also having a pair of ports connecting adjacent casing-ports when the first-mentioned valve-plug ports are not in register therewith.

5. In combination, a gas-tank having an induction-port, a valve-casing in the bottom of the tank and having a pair of ports leading to the top thereof and a lateral port opening at the bottom of and within the tank, and a rotatable valve-plug in the casing and having a pair of externally-opening ports so placed that their inner ends will register with the pair of casing-ports or one of the valve-plug ports will register with the lateral casing-port.

6. In combination, a tank having an inlet-port 11, a valve-casing fixed in the bottom of the tank and having a pair of ports leading from the valve-seat through its inner end, a duct leading from one of such ports to the top of and opening within the tank, a second pair of ports located intermediate of the first pair and opening laterally through the walls of the valve-casing to the interior of the tank, an oscillating valve-plug seated within the casing and having a pair of ports opening through its outer end and through its side walls in line with the valve-plug ports, and segmental cavities of sufficient length to overlap adjacent casing-ports.

705,115. **ACETYLENE-GAS GENERATOR.** JOHN A. MOSHER, Chicago, Ill., assignor to the Adams & Westlake Company, a Corporation of Illinois. Filed Mar. 8, 1902. Serial No. 97,356. (No model.)



Claim.—1. In an acetylene-generator, in combination, a reservoir, a generating-cell, a receptacle into which the reservoir discharges, means for maintaining the water in the receptacle at a constant level, an intermediate chamber opening directly to the cell, and a conduit leading from the receptacle and entering the intermediate chamber at its bottom.

2. In an acetylene-generator, in combination, a reservoir, a generating-cell, a receptacle into which the reservoir discharges, means for maintaining the water in the receptacle at a constant level, an intermediate chamber opening directly to the cell, a conduit leading from the receptacle and entering the intermediate chamber at its bottom, and a vent-pipe communicating with the conduit.

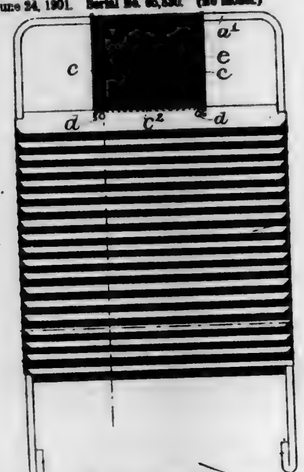
3. In an acetylene-generator, in combination, a reservoir, a generating-cell, a cup into which the reservoir discharges, means for maintaining the water in the cup at a constant level, a supplemental reservoir opening into the cell, a feed-water pipe leading from the cup to the supplemental reservoir and extending in the form of a loop below the same, and a gas-passage leading from the generating-cell.

4. In an acetylene-generator, in combination, a reservoir, a generating-cell, a cup into which the reservoir discharges, means for maintaining the water in said cup at a constant level, a supplemental reservoir, a feed-water pipe leading from the cup to the supplemental reservoir and which is extended in the form of a loop below the same, an upwardly-ex-

tending vent-pipe communicating with the feed-water pipe, and a gas-passage leading from the generating-coil.

5. In an acetylene-generator, in combination, a reservoir, a generating-coil, a cup into which the reservoir discharges, means for maintaining the water in the cup at a constant level, a supplemental reservoir, a feed-water pipe leading from the cup to the supplemental reservoir and extending in the form of a loop below the same, communication between the supplemental reservoir and the generating-coil, and a vertical vent-pipe communicating with the feed-pipe near the supplemental reservoir and extending above the level of the water in the cup into which the reservoir discharges.

705,116. WASHBOARD. WILLIAM B. MURPHY, Lynn, Mass. Filed June 24, 1901. Serial No. 65,830. (No model.)



Claim.—1. A washboard comprising a rubbing-surface formed of a corrugated metallic plate, and a supporting-frame formed of a metallic rod bent to provide side bars and an end bar, the edges of said plate being bent around the side bars to secure them together, the corrugations of the plate extending crosswise of the washboard whereby the said plate and frame coact to secure sufficient rigidity without additional bracing.

2. A washboard comprising a frame formed of a metallic rod bent to provide side bars and an upper end bar, a corrugated plate having its side edges secured to the said side bars, and a soap-holder connecting the said plate to the said end bar.

3. A washboard comprising a frame formed of a metallic rod bent to provide side bars and an upper end bar, a corrugated plate having its side edges coiled or bent around the side bars, and its upper edge bent downwardly, and a soap-holder formed of metal and having its lower end interlocked with the upper edge of the plate and its upper end coiled or bent around the said end bar.

4. A washboard comprising a supporting-frame formed of a metallic rod bent to provide side bars and an end bar, and a rubbing-surface formed of a corrugated metallic plate having its edges bent around the side bars intermediate the upper and lower portions thereof, means being provided to prevent movement of the plate longitudinally of the side bars, the cross-bar of the frame forming the usual pressure-bearing and the lower ends of the side bars forming supporting-legs.

705,117. INHALER. CHARLES H. MYERS, South Bend, Ind. Filed Feb. 15, 1900. Serial No. 5,262. (No model.)

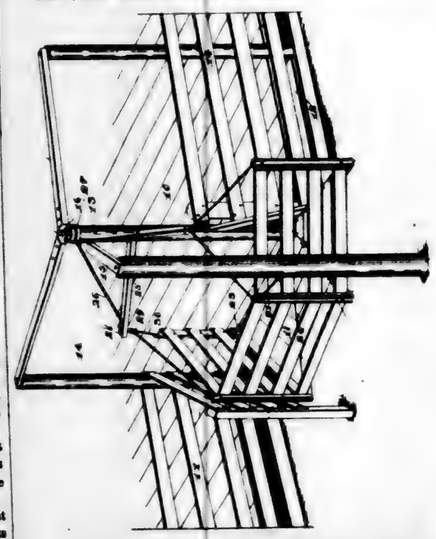
Claim.—1. An inhaler, the combination with a flask, of a tubular body, nostril projections on the upper end thereof, a part at its lower end adapted to engage over the flask-neck, a nozzle in the side of the body having an exhalation-port therein, a valve fitted to control the port, an inhalation-tube at its upper end fitted through said nozzle and valve and at its lower end extending into the flask.

2. An inhaler comprising a body having nostril projections thereon, an exhalation-valve and a neck at its lower end having a cover-flange projecting therein above the said neck, of an inhalation-tube extending from within the said body downwardly therefrom within said flange and a flask fitted upon said neck and receiving the lower end of the inhaler-tube, substantially as described.

3. An inhaler comprising a body having nostril projections thereon, an exhalation-valve, a neck at its lower end, a flask fitted to said neck, an inhalation-tube passing through the body and extending down into the flask, and a dash-plate secured to the inhalation-tube and extending outwardly therefrom at the top and nearly closing the neck of the flask, substantially as described.

4. An inhaler comprising a body having nostril projections thereon, an exhaust-valve and a neck at its lower end, a flask fitted to said neck, an inhalation-tube passing through the body and extending down into the flask, a cover-flange projecting from the top of the flask inwardly, and a dash-plate extending from the inhalation-tube outwardly, substantially as described.

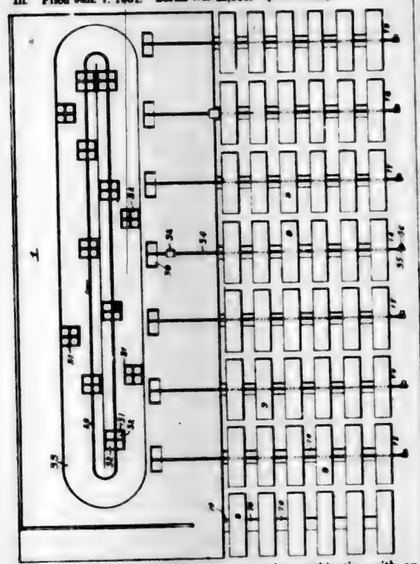
705,118. SWINGING ANIMAL-CHUTE. EPHRAIM MYERS, Murray, Iowa, assignor of one-half to C. C. Bancroft, Barnby, Iowa. Filed Mar. 1, 1902. Serial No. 96,263. (No model.)



Claim.—1. An improved swinging animal-chute, comprising in combination a fence having an opening therein, the pivoted standard near one edge of the opening, a substantially semicircular platform fixed to the pivoted standard, a fence surrounding the periphery of the semicircular platform, said parts being so arranged and proportioned that in one position the opening through the fence will be closed by the fence on the swinging platform and in another position a passage-way will be provided over the platform and through the gate-opening.

2. An improved swinging animal-chute, comprising in combination a fence having a gate-opening therein, a sill resting on the ground-surface, an upright standard rotatively mounted upon the sill, means for pivotally supporting the upper end of the standard, a series of braces projecting radially from the lower portion of the standard, the straps for holding these braces to the standard, a semicircular platform mounted on said braces, uprights at the outer ends of the braces, a metal strap for each upright having its upper end perforated and having its body portion extended along the outer surface of the uprights and along the under surface of the braces, brace-straps for each upright fixed at one end to the upright and at its other end to the top of the platform, a number of arms fixed to the top portion of the standard and slotted at their outer ends, a collar fixed to the top of the standard, a number of rods fixed at their upper ends to the said collar passed through the slots in the arms and having loops at their lower ends, a number of rods hooked at their upper ends into said loops and connected at their lower ends with said perforated straps and means for securing the swinging platform to a stationary support to hold it in a fixed position.

705,119. TRANSFER SYSTEM. EDWARD W. MCKENNA, Chicago Ill. Filed Jan. 7, 1901. Serial No. 42,388. (No model.)



Claim.—1. In a freight-transfer system, the combination with an elevated track arranged in a looped path, of motor means adapted for operation upon said track, hoisting mechanism cooperatively associated with said track, trucks for supporting freight, and conveying-cages for said trucks, said conveying-cages being adapted, through the agency of said motor means and said hoisting mechanism, to be lifted and conveyed from place to place along said looped path, substantially as described.

2. In a freight-transfer system, the combination with an elevated track arranged in a looped path, of motor means adapted for operation upon said track, hoisting mechanism cooperatively associated with said track, trucks for supporting freight, conveying-cages for said trucks, said conveying-cages being adapted, through the agency of said motor means and said hoisting mechanism, to be lifted and conveyed from place to place along said looped path, and means for bringing the said conveying-cages, when not associated with said motor means and hoisting mechanism, out of the said looped path, substantially as described.

3. In a freight-transfer house, the combination with an elevated track within said freight-transfer house arranged in a looped path, of motor means adapted for operation upon said track, hoisting mechanism operatively associated with said track, freight-conveying cages adapted, through the agency of said motor means and said hoisting mechanism, to be lifted and conveyed from place to place along said looped path, the floor of the said freight-house declining outward from the center line of said looped path, for the purpose of bringing said freight-conveying cages out of said looped path when released by said hoisting mechanism, substantially as described.

4. In a freight-transfer system, the combination with an elevated track arranged in a looped path, of freight-supporting devices, means associated with said track for lifting and conveying said freight-conveying devices along said looped path, and means for bringing the said freight-supporting devices, when not associated with the first aforesaid means, laterally away from the said looped path, substantially as described.

5. In a freight-transfer system, the combination with an elevated track arranged in a looped path, of motor means adapted for operation upon said track, hoisting mechanism cooperatively associated with said track, trucks for supporting freight, conveying-cages for said trucks, said conveying-cages being adapted, through the agency of said motor means and said hoisting mechanism, to be lifted and conveyed from place to place along said looped path, and automatic means for bringing the said conveying-cages, when not associated with said motor means and hoisting mechanism, out of the said looped path, substantially as described.

6. In a freight-transfer house the combination with an elevated track within said freight-transfer house arranged in a looped path, of motor means adapted for operation upon said track, hoisting mechanism operatively associated with said track, freight-conveying trucks, cages adapted to carry said trucks and adapted, through the agency of said motor means and said hoisting mechanism, to be lifted and conveyed from place to place along said looped path, and a groove for said cages provided in the floor of said freight-house below said track, the surface of said groove declining outwardly from the center line thereof, the outermost portion of the said groove being of sufficient depth to permit the floor of the said cages to register with the normal level of the freight-house floor, substantially as described.

7. In a freight-transfer system, the combination with a transfer-house having a receiving and a discharging side, of a track in the form of a looped path interposed between the said sides of the transfer-house, a plurality of hand trucks or carriers for transferring freight from the receiving to the discharging side of the house, a plurality of conveyers moving upon the said track for picking up the trucks and moving them from the receiving to the discharging portions of the track, and means associated with each conveyer for lifting the truck carried thereby off the floor of the freight-house, substantially as described.

8. In a freight-transfer system, the combination with a transfer-house having a receiving side and a discharging side, of a track in the form of a looped path interposed between the receiving and discharging sides of the freight-house, hand trucks or carriers for conveying freight from the receiving side to the discharging side of the transfer-house, and conveying means moving upon the track for receiving the freight at the receiving side of the track and carrying the same to the discharging side of the track where the freight may be carried to the discharging side of the transfer-house, substantially as described.

705,120. NUT-LOCK. JOHN MCVEY, Longue Pointe, Canada. Filed July 17, 1901. Serial No. 68,569. (No model.)

Claim.—1. In a nut-lock, the combination with a bolt, of a nut provided with a groove which intersects with the threads in an opening thereof, said groove having an inclined bottom, and a tapering fastener fitted in said groove for an inclined edge of the fastener to engage with the corresponding bottom of the groove, the inner end of the fastener being extended beyond the inner face of the nut and the active edge of the fastener occupying opposing relation to the threads of the bolt, said inner end of the fastener and the active edge thereof being beveled, substantially as described.

2. In a nut-lock, the combination with a bolt, of a nut provided with a radial groove which has a sloping bottom, and a fastener fitted in said groove and having a beveled inner edge and an active edge which is beveled and is in opposing relation to the threads of the bolt, substantially as described.

3. In a nut-lock, the combination with a threaded bolt, of a nut provided with a radial groove having an inclined bottom and a wedge-like fastener seated in said groove with its inner end extending beyond the inner face of the nut, and having its active edge beveled and disposed in opposing relation to the threads of the bolt, substantially as described.

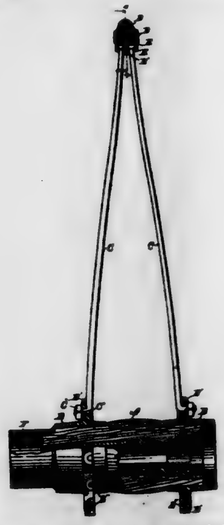
705,121. VEHICLE-WHEEL. NELSON A. NEWTON, Kalamazoo, Mich. Filed Mar. 20, 1902. Serial No. 98,114. (No model.)

Claim.—1. In a vehicle-wheel, the combination of the wood center portion A; bands having suitable perforated flanges or projections B', with suitable seats B'' therein; spokes C having their lower ends formed to extend through the perforations in the said hub-bands and screw-threaded to receive suitable nuts C''; plates E suitably perforated to receive the spokes C therethrough; a channeled rim D, to which said plates are secured; tension-plates E'', adapted to be inserted between said plates E and said channeled rim; and a suitable tire D' in said channeled rim, all coacting for the purpose specified.

2. In a vehicle-wheel, the combination of the wood center portion A; bands having suitable perforated flanges or projections B with suitable seats B'' therein; spokes C having their lower ends formed to extend through perforations in the said hub-bands and screw-threaded to receive suitable nuts C''; plates E suitably perforated to receive the spokes C therethrough; a channeled rim D to which said plates are secured in a manner to put tension on said spokes; and a suitable tire D' in said channeled rim, all coacting for the purpose specified.

3. In a vehicle-wheel, the combination of a hub; hub-bands with outwardly-projecting flanges or lugs; suitable seats therein to receive the spokes; spokes adapted to rest in said seats and engaging said flanges and threaded to receive suitable retaining-nuts; tire-plates with complemental perforations to receive heads on the outer ends of said spokes; a rim to which said plates are detachably secured; tension-plates adapted to be

inserted between said tire-plates and rim, to regulate the tension on the spokes, as specified.



4. In a vehicle-wheel, the combination of a hub; hub-bands with outwardly-projecting flanges or lugs; suitable seats therein to receive the spokes; spokes adapted to rest in said seats and engaging said flanges and threaded to receive suitable retaining-nuts; tire-plates with countersunk perforations to receive heads on the outer ends of said spokes; a rim to which said tire-plates are detachably secured in a manner to put tension on said spokes, for the purpose specified.

5. In a vehicle-wheel, the combination of a hub; hub-bands with outwardly-projecting flanges having perforations to receive the spokes formed therein; metal spokes with heads at their outer ends; tire-plates with countersunk perforations to receive the heads on the outer ends of said spokes; a rim to which said tire-plates are detachably secured; tension-plates adapted to be inserted between said tire-plates and said rim, to regulate the tension on said spokes, for the purpose specified.

6. In a vehicle-wheel, the combination of a suitable hub; metal spokes with heads at their outer ends secured thereto; tire-plates with countersunk perforations to receive the heads on the outer ends of the said spokes; a rim to which said tire-plates are secured; and tension-plates adapted to be inserted between said rim and said tire-plates, for the purpose specified.

705,122. ELECTRIC-ARC LAMP. JOHN S. HOWOTHY, Madisonville, Ohio, assignor to General Electric Company, a Corporation of New York. Filed June 28, 1897. Serial No. 642,630. (No model.)

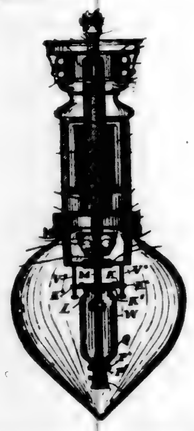
Claim.—1. In an electric-arc lamp, the combination of a carbon-holder, a tube which incloses the holder, an armature, a solenoid-magnet, a core which incloses the magnet, an extension on the core, and means for adjusting the armature so that its position with respect to the extension may be varied to compensate for different lengths of arc.

2. In an electric-arc lamp, the combination of a tube, stops formed thereon, a core embracing the tube, means engaging with the stops for adjusting the core, and a solenoid-magnet surrounding the core, the parts being so arranged that altering the position of the core on the tube varies the intensity of the magnetic field by changing the magnetic reluctance.

3. In an electric-arc lamp, the combination of a frame-tube which surrounds the carbon and passes through the solenoid, a solenoid, a core for the solenoid which engages with the tube, an armature located within the tube, a piston secured to the armature and arranged to work in the tube, the said piston and tube constituting a dash-pot, and a flexible connection between the armature and piston for compensating for inaccuracies in alinement.

4. In an arc-lamp, the combination of a drum composed of a main body and a detachable flange, bolts for securing the flange to the body, coils of resistance-wire encircling the drum and presenting parallel surfaces, means for connecting the coils at one end, means for connecting the opposite ends to terminals, and a connector which is circumferentially adjustable on the coils for varying the amount of resistance in circuit.

5. In combination with an arc striking and feeding mechanism, a rheostat comprising a support covered with insulating material, a body of resistance material, insulated clamps for securing the resistance-body to the support which are provided with curved inner faces, a two-part connector which engages with the resistance-body for cutting portions of it into and out of circuit, and means for clamping the two parts of the connector around the resistance material.



6. In an arc-lamp resistance, the combination of a cylindrical support, a body of resistance material mounted thereon, and a pair of flanges forming a part of the support and located above and below the said body for the purpose of protecting it.

7. In an arc-lamp, the combination of a cylinder-support, a flange formed integral therewith, a body of resistance material surrounding the support, a detachable flange located at one end of the support, and means for securing the flange to said support.

8. In an electric-arc lamp, the combination of a tubular frame, a resistance-supporting device secured to the frame, means for suspending the lamp, and a single means for securing the supporting device to the frame and also retaining the resistance-supporting device in place.

9. In combination, a support, a resistance-wire coiled around the support, means for securing the wire to the support, and means for cutting out more or less of the wire, which means is supported entirely by the said resistance-wire.

10. In an arc-lamp, the combination of a support, coiled resistance-wire wound thereon, the arrangement being such that one part of the wire is wound in a clockwise direction, the balance in an anticlockwise direction, means for holding the wire at the point of turning, means for holding the ends of the wire, and a contact arranged to bridge more or less of two turns.

11. In connection with an arc-lamp, a rheostat in the form of a drum composed of metal and carrying on its surface insulated coils of high-resistance material and attached thereto by means of clips with insulating material between the clips and coils, the said clips being attached to the drum by suitable means, the resistance spiral coils on the drum lying parallel to one another and encircling the drum, and a short-circuit strap attached to the spiral, and circumferentially adjustable thereon.

12. In an electric-arc lamp, the combination of a fixed frame-tube carrying a solenoid, a tube carrying the armature or core and located within the frame-tube, and movable therein under the influence of the current in the solenoid, a carbon-holder movable in the tube carrying the core, and a plate capable of moving edgewise to compensate for changes in alinement of the feeding carbon, which also acts as a stop for the carbon-holder.

13. In an electric-arc lamp, the combination of a fixed frame-tube carrying a solenoid-coil, an armature or core, a tube carrying the core and movable with it under the action of the current in the solenoid, a carbon-holder, a plate which is perforated to receive the feeding electrode and is free to move edgewise, the said plate also acting as a stop for the carbon-holder, a globe, and a support common to the plate and upper end of the globe.

14. In an electric-arc lamp, the combination of the fixed tube carrying a solenoid-coil, a core, a tube carrying the latter, and slidable with the core within the fixed tube, in accordance with changes in the strength of the current through the coil, a frictional carbon-holder slidable in said tube, a carbon-guide consisting of the depressed plate free to move edgewise thus permitting the carbon to remain in its straight line of descent, and also operating to duly stop the carbon-holder, and a disk supporting the guide, and having a depending flange within which is received the upper edge of the inner globe for holding the same in place.

15. In an electric-arc lamp, the combination of a slidable carbon, a frame, guide-rods secured thereto, a disk capable of moving on said rods, and having a flange for receiving the upper end of the arc-inclosing globe, a lower holder having a flange for receiving the globe, and a lower-carbon holder, both of said holders being mounted on the frame of the lamp.

16. In an electric-arc lamp, the combination of an arc-inclosing globe, a lower holder therefor having a screw-threaded portion and a flange for retaining the globe, a frame which is formed integral with the holder, means for holding the lower carbon which fits into the screw-threaded opening, and means for pressing the globe against the holder.

17. In an electric-arc lamp, the combination of an arc-inclosing globe, a holder in which the lower end of the globe rests, a frame for supporting the lower holder, a holder which engages the upper end of the globe and retains it in place by pressing it downward, and rods which limit the downward movement of the upper holder, and suspend the same when the globe is removed.

18. In an electric-arc lamp, the combination of an arc-inclosing globe, a support for the lower end in which the globe rests freely, a frame to which the support is secured, a support for the upper end which retains the globe in place, a gas-cap for restricting the admission of air to the globe and the exit of gas, and a pair of rods for limiting the downward movement of the gas-cap.

19. In an electric-arc lamp, the combination of an arc-inclosing globe, a support for the lower end thereof, a frame to which the support is secured, a support which engages with the upper end and retains the globe in place, and a guide for the upper support which permits it to be raised or lowered at will.

20. In an electric-arc lamp, the combination of an arc-inclosing globe, a support for the lower end thereof, a frame to which the support is secured, a support which has a flange that surrounds and engages the upper end of the globe, guide-rods on which the support is free to slide, and means for limiting the downward movement of the support.

21. In an electric-arc lamp, the combination of a frame having a slotted flange, a globe, a ring permanently secured to the globe, projections on the ring which enter the slots in the flange, swivel-hooks for retaining the pins within the slots, and means for limiting the angular movement of the hooks.

22. In an electric-arc lamp, the combination of a frame having a slotted flange, a globe, a ring permanently secured to the globe, projections on the ring which enter the slots in the flange, means for retaining the pins in the slots, and means for holding the globe in place when the retaining means are displaced.

23. In an electric-arc lamp, the combination of a frame having a downturned slotted flange, a ring having projections which enter the slots, pivoted latches arranged to engage with the projections, and set-screws which hold the latches in place and also enter holes in the ring and support it when the latches are displaced.

24. In an electric-arc lamp, the combination of a globe or cylinder which incloses the carbons, a cap which rests loosely on the top of the cylinder and prevents the free entrance of air into the cylinder, and means for retaining the cap within the lamp at or near its normal position when the cylinder is removed.

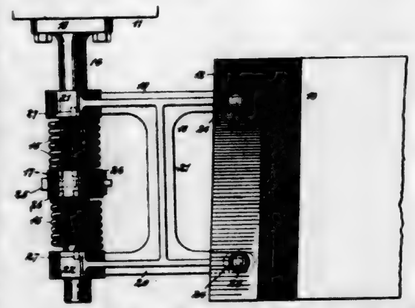
25. In an electric-arc lamp, the combination of a globe or cylinder which incloses the carbons, a cap which is arranged to close one end of the cylinder and rests loosely on the cylinder, and means for retaining the cap in place after the cylinder is removed.

705,123. SCRAPER OR CLEANER FOR WHEELS. WILLIAM C. OASTLER, New York, N. Y. Filed May 12, 1902. Serial No. 106,917. (No model.)

Claim.—1. The scraper for wheels comprising the frame having and carrying at its outer end the scraper-blade, and the bracket-rod supporting said frame and upon which the same is adapted to turn, combined with the opposing springs connected with and maintaining said frame and blade in operative position, and means for connecting said springs at one end to said rod; substantially as set forth.

2. The scraper for wheels comprising the frame having and carrying at its outer end the scraper-blade and provided at its inner end with the hubs 21, 22, and the bracket-rod passing through said hubs and upon which said frame is adapted to turn, combined with the collar on said rod, and the reversely-coiled springs connected at one end to said frame and at the other end to said collar; substantially as set forth.

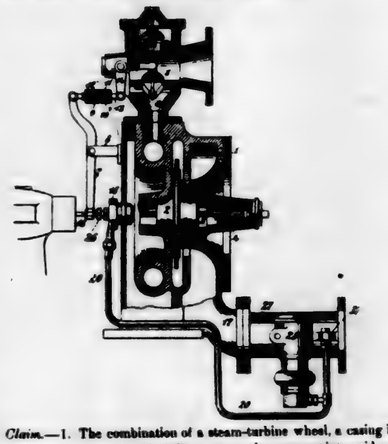
3. The scraper for wheels comprising the frame having and carrying at its outer end the scraper-blade and provided at its inner end with the hubs 21, 22, and the bracket-rod passing through said hubs and upon which said frame is adapted to turn, combined with the collar on said rod, means for detachably securing said collar, and the reversely-coiled springs on said rod at opposite sides of said collar, said springs at their outer ends being connected with said frame and at their inner ends with said collar; substantially as set forth



4. The scraper for wheels comprising the frame having and carrying at its outer end the scraper-blade and provided at its inner end with the hubs 21, 22, and the bracket-rod passing through said hubs and upon which said frame is adapted to turn, combined with the collar on said rod and having the series of apertures in its opposite sides, means for detachably securing said collar and the reversely-coiled independent springs on said rod at opposite sides of said collar, said springs at their outer ends being connected with said frame and at their inner ends held in said apertures; substantially as set forth.

5. The scraper for wheels comprising the frame, the reversible scraper-blade at the outer end thereof, means for detachably securing said blade in position, and the rod supporting said frame and upon which the same is adapted to turn, combined with the opposing springs connected with and maintaining said blade in operative position, and means for connecting said springs at one end to said rod: substantially as set forth.

705,124. APPARATUS FOR CONTROLLING THE SPEED OF STEAM-TURBINES. GUSTAF O. M. OLSSON, Stockholm, Sweden, assignor to De Laval Steam Turbine Company, a Corporation of New Jersey. Filed June 28, 1901. Serial No. 66,364. (No model.)



Claim.—1. The combination of a steam-turbine wheel, a casing inclosing the same, means for admitting steam under pressure into said casing, means for reducing atmospheric pressure existing within said casing, a valve constructed to cut off connection between said reducing means and said casing, and means for operating the said valve; whereby steam may be imprisoned in said casing and a resisting medium to the rotation of said wheel thus provided.

2. The combination of a steam-turbine wheel, a casing inclosing the same, means for admitting steam under pressure into said casing, means for reducing atmospheric pressure within said casing, a valve constructed to cut off connection between said reducing means and said casing, and

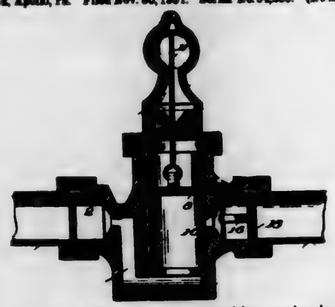
means automatically operating to close said valve when said wheel has attained a certain predetermined speed of revolution.

3. The combination of a steam-turbine wheel, a casing inclosing the same, means for admitting steam under pressure into said casing, means for reducing atmospheric pressure within said casing, a valve constructed to cut off connection between said reducing means and said casing, and means actuated by said wheel for closing said valve when said wheel shall have attained a certain predetermined speed of revolution.

4. The combination of a steam-turbine wheel, a vacuum-chamber inclosing the same having a steam-inlet and an outlet-conduit through which the atmosphere is exhausted from said chamber, a valve in said outlet-conduit a cylinder, a piston therein controlling said valve, a spring acting on one side of said piston, means for producing a vacuum on the same side of said piston and thereby causing the same to compress said spring and open said valve, and means for destroying said vacuum and causing said spring to act on said piston to close said valve; the said last-named means being actuated by said turbine wheel after it has attained a certain predetermined speed, substantially as described.

5. The combination with the steam-turbine wheel 2, casing 1, and pipe 27 of the air-valve 18, means for opening the same actuated by said turbine wheel after said wheel shall have attained a certain predetermined speed, cylinder 29, piston 30, valve 31 in said pipe 27, intermediate mechanism between said piston and valve, spring 35 bearing on said piston, and pipe 20 communicating with said pipe 27, and with said cylinder 29, substantially as described.

705,125. GAS-SERVICE SAFETY-VALVE. LATHAN M. OSBORNE, Apollo, Pa. Filed Nov. 30, 1901. Serial No. 84,255. (No model.)



Claim.—A gas-service safety-valve comprising a casing having a vertical cylinder, offstanding coupling ends intermediate of the upper and lower ends of the cylinder, the inlet-coupling end having communication with the cylinder at a point between its ends, a passage connecting the outlet-coupling end with the bottom of the cylinder, a strainer located in the inlet-coupling end, a cover closing the upper end of the cylinder and having a vertically-apertured boss, the upper end of the opening being enlarged, a valve freely movable vertically within the cylinder and having its stem passing loosely through the opening of the cover, said valve being held above the inlet by the pressure of the gas and adapted to be held seated when closed by the same pressure, the inlet being wholly below the valve when the latter is open and entirely above the said valve when the latter is seated, and a cap fitted to the boss of the cover for inclosing the upper end of the valve-stem, substantially as specified.

705,126. HORN FOR SOUND RECORDING AND REPRODUCING APPARATUS. GEORGE OTIS and WILLIAM P. SPALDING, Denver, Colo. Filed June 27, 1901. Serial No. 66,301. (No model.)

Claim.—1. In sound recording and reproducing instruments, the combination of a multiple horn comprising a plurality of small horns separated from each other by a sounding-board, with a sound recorder or reproducer in communication with said multiple horn.

2. A multiple horn comprising a plurality of small horns separated from each other by a sounding-board and a common distributing chamber or mouth with which the small horns communicate at their smaller ends.

3. A multiple horn comprising a wooden body part divided interiorly into a plurality of small horns by a wooden sounding-board.

4. A horn comprising a plurality of small horns separated from each other by a sounding-board, a common distributing chamber or mouth with which the small horns communicate at their small ends, and a hood or bell common to all of the small horns and into which said small horns discharge or from which they receive the sounds at their larger ends.

5. A horn comprising a body part adapted to communicate at its small end with a recorder or reproducer, a lateral partition in the body part forming a mouth or distributing-chamber at the smaller end of the horn, and a longitudinally-extending sounding-board dividing the interior of the body part outside of the mouth into two small horns communicating with the mouth through openings in the lateral partition.

6. A horn comprising a body part adapted to communicate at its small end with a recorder or reproducer, a lateral partition in the body part forming a mouth or distributing-chamber at the smaller end of the horn, a longitudinally-extending sounding-board dividing the interior of the body part outside of the mouth into two small horns communicating with the mouth through openings in the lateral partition, and a hood or bell common to all of the small horns and into which said horns discharge or from which they receive the sounds at their larger ends.

7. A horn for use with apparatus for recording and reproducing sounds having a sounding-board longitudinally disposed therein.

8. A horn for use with apparatus for recording and reproducing sounds having a sounding-board longitudinally disposed therein and a sound-post interposed between the sounding-board and side wall of the horn.

9. A wooden horn for use with apparatus for recording and reproducing sounds having a wooden sounding-board longitudinally disposed therein and a sound-post interposed between the sounding-board and side wall of the horn.

705,127. BUILDING-SLAB AND MEANS FOR SUPPORTING SAME. THEODORE P. PAYNE, Irvington, N. J., assignor of one-half to Seymour H. Robinson, New Rochelle, N. Y. Filed Oct. 24, 1901. Serial No. 79,838. (No model.)

Claim.—1. A flat building-slab having a sheet of reticulated metal disposed flatwise in its body and bars of flat iron disposed edgewise in its body to stiffen the block against transverse strains.

2. A flat building-slab having a sheet of reticulated metal disposed flatwise in its body and bars of flat iron disposed edgewise in its body and threaded through the meshes of the reticulated metal so that both may lie substantially in the center of the body.

3. A building-slab having flat stiffening bars disposed edgewise in its body, and provided respectively at the opposite ends of such flat bars with a longitudinal tongue and groove and the bars notched at their ends to engage a pair of supporting rods or ropes.

4. A flat building-slab having a sheet of reticulated metal disposed flatwise in its body, bars of flat iron disposed edgewise in its body, and the block provided respectively at the opposite ends of such flat bars with a longitudinal tongue and groove, and the bars notched at their ends to engage a pair of supporting rods or ropes.

5. The combination, with flat building-slabs having flat iron bars disposed edgewise in their bodies and notched at the end, of a wire rope formed of two wires fixed at the ends and twisted to produce tension and engaged with the notches upon the said bars.

6. The combination, with the posts or rafters of a building, and a series of horizontally-disposed ropes formed of wires fixed at their ends and twisted to produce tension, of a series of flat slabs inserted between the several ropes and provided each upon the ends with a tongue and groove, and means in the groove for engaging each wire rope, whereby the slabs are held in a common plane by the series of ropes.

7. The combination, with the posts or rafters of a building, and a series of horizontally-disposed ropes formed of wire fixed at their ends and twisted to produce tension, and flat slabs provided respectively upon their opposite ends with tongue and groove, and having flat iron bars disposed edgewise in the slabs with their ends projected into the said tongue and groove and suitably notched to fit the wire ropes, whereby the slabs may be secured in horizontal series between the ropes and held in place by the engagement of the notched bars and the ropes.

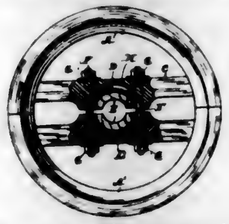
705,128. PIPE-WRENCH. HARRISON PEASE, Giles, Nebr. Filed Nov. 12, 1901. Serial No. 82,066. (No model.)

Claim.—1. In a pipe-wrench, a handle, one end of which is provided with a rigid jaw, the outer surface of the jaw being cut away, a movable jaw, the outer end of which is curved to correspond with the rigid jaw and the rear end is recessed to fit upon the back of the rigid jaw, and two plates pivotally secured at their ends to said jaws, substantially as described.

2. A pipe-wrench comprising a shank, a fixed jaw, said fixed jaw being serrated and provided with a curved extension a movable jaw provided with serrations, and also having a curved extension adapted to overlap and rest upon the curved extension of the fixed jaw, and the curved plates connecting the fixed and movable jaws, as set forth.

3. A pipe-wrench comprising a shank, a fixed jaw, said fixed jaw being serrated and provided with a curved extension, a movable jaw provided with serrations and also having a curved extension adapted to overlap and rest upon the curved extension of the fixed jaw, and the curved plates connecting the fixed and movable jaws, said curved plates having their inner edges serrated, as set forth.

705,129. PULLEY. WILLIAM B. PEET, Lakemills, Wis., assignor to P. B. Pargo and Company, Lakemills, Wis., a Corporation of Wisconsin. Filed Oct. 18, 1901. Serial No. 79,202. (No model.)



Claim.—A pulley, comprising two semicircular complementary members each composed of a rim, a cross-piece substantially diametrical of the rim and connecting the extremities of the rim the cross-piece having a concave axial recess, a metal semicylindrical bushing of anvarying size fitting into the axial recess of the cross-piece, and a wood semicylindrical bushing fitting into the metal bushing, and also U-shaped clips let into the cross-piece of one member about its metal and wood bushings, the legs of the clips extending through the cross-pieces of the complementary member, and nuts on the legs of the clips adapted to turn against the cross-piece of the complementary member.

705,130. HOOP-MAKING MACHINE. JOHN C. PERRY, Clinton, Mass. Filed Apr. 7, 1902. Serial No. 101,748. (No model.)

Claim.—1. A machine for making a series of independent hoops from a metallic strip of indeterminate length, said machine having provisions for cutting and bending successive lengths of said strip into predetermined shape with the ends in juxtaposition, and means for successively welding the meeting ends of the said lengths.

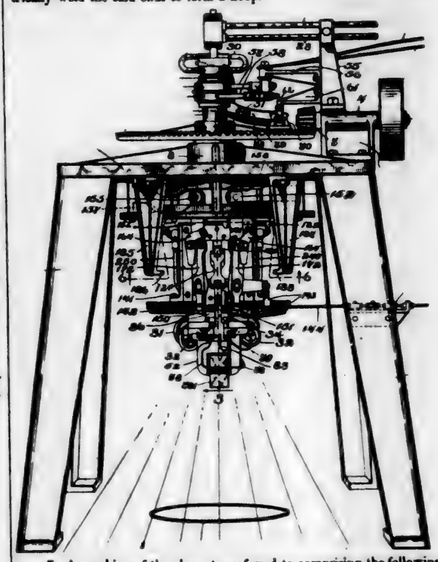
2. A machine for making a series of independent hoops from a metallic strip of indeterminate length, said machine having provisions for feeding, bending and cutting said strip into successive lengths with their ends in juxtaposition, and means for successively electrically welding the meeting ends of the said lengths.

3. A machine for making independent hoops comprising means for bending a metallic strip of indeterminate length to the required form, means for severing the strip at a predetermined point, and means for positioning and electrically welding the ends of the severed portion.

4. A machine for making successive independent hoops, comprising a "former," means for bending elongated metal about said "former," guides for receiving and holding said metal, and means for electrically welding the meeting ends of said metal to form an independent hoop or band.

5. A machine for making successive independent hoops comprising means for bending a metallic strip into a loop, means for positioning the ends of said loop in alinement, and means for electrically welding the said ends to form an endless band.

6. A machine for making independent hoops comprising the following instrumentalities, to wit: "forming" mechanism, severing mechanism, positioning mechanism, and welding mechanism, said instrumentalities operating to bend the end of a metallic strip into a loop, to sever said bent portion or loop, to position the ends of said severed portion, and to electrically weld the said ends to form a hoop.



7. A machine of the character referred to comprising the following instrumentalities, to wit: a rotating "former" having means for clamping a metallic strip and forming a loop thereof, and electrical welding means rotatable with "former" for welding the ends of said loop.

8. A machine of the character referred to comprising the following instrumentalities, to wit: loop-forming mechanism, electric welding mechanism, and mechanism for independently discharging a formed and welded band.

9. A machine of the character referred to comprising the following instrumentalities, to wit: band-forming mechanism, severing mechanism and welding mechanism, said instrumentalities being arranged and operated whereby when the ends of one band are being welded, another independent band is being formed.

10. A machine of the character referred to comprising the following instrumentalities, to wit: mechanism for forming successively a plurality of loops, mechanism for severing the formed loops, mechanism for electrically welding the ends of the formed and severed loops, and mechanism for discharging the welded bands, the said instrumentalities operating to continuously form and weld independent bands from a metallic strip of indeterminate length.

11. A machine of the character referred to comprising the following instrumentalities, to wit: means including a "former" for bending the metallic strip into a loop around said "former" and severing the same, mechanism for loosening said loop on said "former," and means for electrically welding the ends of the loop to form an independent band.

12. A machine of the character referred to comprising the following instrumentalities, to wit: means including a "former" and clamping device thereon for bending a metallic strip into a loop, and welding mechanism including electrodes having independent clamping devices for moving the ends of the wire of one loop together during the welding thereof.

13. A machine of the character referred to comprising the following instrumentalities, to wit: mechanism including a rotating "former" with a feeding-clamp thereon for bending a metallic strip into a loop, welding mechanism having electrode-clamps for clamping the ends of the loop, and means whereby the ends of the loop are transferred from the feeding-clamps to the electrode-clamps.

14. A machine of the character referred to comprising the following instrumentalities, to wit: a support, means for winding the end of a metallic strip of indeterminate length around said support to form a loop, means for severing the said loop, and means for positioning and electrically welding the ends of one loop independently of the other loops.

15. A machine of the character referred to comprising the following instrumentalities, to wit: a support, means for bending a metallic strip of

indeterminate length into successive loops around said support, mechanism for severing and positioning the loops successively as they are formed, electrical welding devices for welding the ends of a loop, and mechanism for releasing or discharging the welded band.

16. A machine of the character referred to comprising the following instrumentalities, to wit: a support, means for feeding a metallic strip around said support to form a loop, means for severing the loop, means for moving said loop from the line of feed of the strip, and means for electrically welding the ends of the severed loop to form an independent endless band.

17. A machine of the character referred to comprising a continuously-rotating mandrel, means on said mandrel for clamping a metallic strip thereto and winding it thereabout, severing mechanism for cutting the said strip into lengths, and welding mechanism rotating with said mandrel for welding the ends of said lengths.

18. A machine of the character referred to, having a rotatable welding mechanism, and a detachable mandrel or former arranged to permit one mandrel to be substituted for another.

19. A machine of the character referred to comprising automatic loop-forming mechanism, electric welding mechanism for holding and uniting the ends of a loop to form an endless band, and an automatic device for controlling the electric current through the welding mechanism.

20. A machine of the character referred to comprising loop-forming mechanism, means for positioning and separating the ends of the loop while said ends are being brought into alinement, and means for electrically welding the ends of the loop together to form an independent hoop.

21. In a machine of the character referred to, means for forming and electrically welding a blank to form a hoop, said means including a cutter moving with the feeding-wire, whereby loops may be formed, severed and welded without stopping the machine.

22. In a machine of the character referred to, means for forming and electrically welding a blank to form a hoop, said means including a cutter arranged to sever the wire at a predetermined point to form a loop while the loop immediately following is being formed.

23. In a machine of the character referred to, means for forming and electrically welding a blank to form a hoop, said means including a cutter, one member of which is arranged to act as a temporary support for the wire while it is being fed in place.

24. In a machine of the character referred to, welding-clamps, and means for automatically placing and holding the ends of a blank in alinement, and means for causing the blank to be thereafter engaged by the welding-clamps.

25. In a machine of the character referred to, welding means, cutting means, and means for clamping and holding a blank arranged to hold the blank while it is being cut and thereafter to move the ends of the blank successively into position to be engaged by the welding means.

26. In a machine of the character referred to, a pair of clamps, and means for automatically operating the same to position the loop previous to welding, to loosen the loop on the mandrel, to remove the loop from its guide or "former" sufficiently to clear the next infeeding loop, and to insure the free discharge of the completed or welded loop.

27. In a machine of the character referred to, a pair of clamps, means for operating the same to clamp the wire and hold it between said clamps while it is being cut to form the blank, to translate the ends of the said wire successively in position for welding, the movement of translation of the clamps being such that they diverge as they approach the line of weld, thus giving clearness to the ends of the blank held by the clamps, and preventing interference as they are brought successively to the welding position.

28. In a machine of the character referred to, feeding-clamps in combination with welding-clamps, said feeding-clamps being adapted to place the ends of the blank into the welding-clamps, and immediately after the clamping of the welding-clamps and previous to the application of the welding-current to free themselves from the blank to permit the free action of the welding-clamps.

29. In a machine of the character referred to, a "former," adapted to receive and form a strip of metal to the desired shape and permit the electrical welding of said strip to take place while around said "former," and permit the free discharge of the completed hoop.

30. In a machine of the character referred to, a "former," electrical welding apparatus placed within said "former" and having its jaws arranged to protrude through said "former," whereby they may grasp the ends of the blank to weld the same, without interfering with the feed or other steps in the formation of the hoop.

31. In a machine of the character referred to, welding-jaws, a former or mandrel, a pair of clamps arranged within said former, projecting through the latter, said clamps being adapted to successively place the ends of a blank in position where they will be clamped by the welding-jaws without interfering with the feeding of the blank or the welding operation.

32. In a machine of the character referred to, means for welding the ends of a blank together to form a hoop while the welding device is in motion, together with the hoop, about the center of rotation of the hoop.

33. In a machine of the character referred to, welding means including welding-jaws, means for successively forming hoops of uniform size or diameter, said means including mechanism for automatically and positively placing the ends of the blanks into said welding-jaws with the same amount of projection for each succeeding hoop, said parts being timed to weld the ends of the blank when positioned.

34. In a machine of the character referred to, feeding means in combination with welding means, said feeding means being arranged to positively place the ends of the blank into the welding means, and thereafter previous to the application of the welding-current, free themselves from the blank to permit the free action of the welding means.

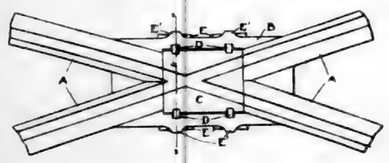
35. In a machine of the class described, a feeding-clamp, a cutter arranged in the path of the feed of the wire, and means for preventing the displacement of the wire relatively to the cutter, during the preliminary movements of the clamp.

36. In a machine of the character referred to, a former or mandrel, a forward feeding-clamp, a rear feeding-clamp provided with a displacing-bar, and means for giving the rear clamp its feeding motion, whereby a predetermined length of blank on the former will be displaced simultaneously with the portion carried by said rear clamp.

37. In a machine of the class described, two or more feeding-clamps each provided with a projecting jaw or ledge, adapted to receive the wire as it is wound upon the machine, said clamps being provided with movable jaws adapted to engage the wire at predetermined times.

38. In a machine of the character referred to, a former or mandrel, welding-jaws, feeding-clamps arranged to hold a blank fed upon the former, a cutting device arranged to sever the blank at a predetermined point, means for causing the clamps to present the blank to the welding-jaws after said cutting operation, and means for positively removing the welded hoops from the welding-jaws.

705,181. RAILWAY-TRACK STRUCTURE. JOHN H. PFLIEGER, Johnstown, Pa., assignor to the Lorain Steel Company, a Corporation of Pennsylvania. Filed Nov. 19, 1901. Serial No. 82,852. (No model.)



Claim.—1. In a track structure, the combination with a wear-plate seated in a pocket in the structure, of fastening members or keys arranged to grip the side portions of said plate and having arms extending outwardly through the side walls of the pocket, and wedges or the like engaging said arms and securing the said members or keys in gripping engagement with the plate.

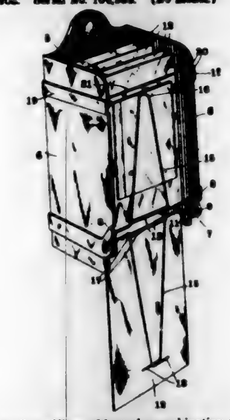
2. In a track structure, the combination with a wear-plate seated in a pocket in the structure, of means for securing said plate in its seat, consisting of angular fastening members or keys engaging the plate and extending outwardly through the side walls of the pocket, and wedges driven between said members or keys and the body of the structure.

3. In a railway-track structure, the combination with a body portion having a pocket therein and apertures leading outwardly from the pocket through its side walls, of a wear-plate seated in said pocket, and approximately Z-shaped fastening members seated between the side of the plate and the walls of the pocket, with their upper arms engaging the plate and their lower arms extending outwardly through said apertures and secured by wedges.

4. In a railway-track structure, the combination with a wear-plate seated in a pocket in the body of the structure, of means for fastening said plate consisting of angular, approximately Z-shaped keys, whose upper arms grip the plate and whose lower arms extend outwardly through the side walls of the pocket and are turned upwardly at their ends, and wedges driven between said upturned ends and the body of the structure.

5. In a railway-track structure, the combination with the body portion having a pocket, and apertures leading outwardly from said pocket through its side walls, of a wear-plate seated in said pocket, and the fastening keys or members D having the arms *d* engaging the plate, the arms extending outwardly through said apertures and terminating in the upturned ends *d'*, and the wedges E driven between said upturned ends *d'* and the body of the structure.

705,182. PAPER-FILE. GEORGE A. PHILLIPS, Marion, Ind. Filed Apr. 28, 1902. Serial No. 104,989. (No model.)

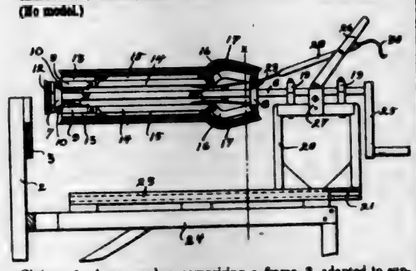


Claim.—1. In a filing-cabinet, the combination of a pair of opposed sides each having a runway formed therein, of a plurality of plates each having a cross-bar adapted to lie in said runway, and a spring-clip carried by each plate for holding papers and the like upon both sides of the plate.

2. In a filing-cabinet, the combination with a pair of opposed sides each having a substantially U-shaped runway formed therein, of a plurality of filing-plates each provided with a cross-bar adapted to lie in said runways, a spring filing-clip carried by each of said plates said clip consisting of a piece of wire doubled upon itself at 16, and the doubled portion again doubled upon itself at 17 17, substantially as and for the purpose set forth.

3. In a filing-cabinet, the combination with a pair of opposed sides 6 each having a depression 7 formed therein and a track 8 leading into said depression from the edge of the side, of a plate mounted in each of said depressions 7 so as to form a U-shaped runway 11, a plurality of filing-plates 12 each provided with a cross-bar 13 having heads 14, and a filing-clip carried by each of said plates, substantially as and for the purpose set forth.

705,183. CAN-WASHER. FRED T. PIERCE and ANVALD R. KOCHENDERFER, Geneva, Minn. Filed Feb. 21, 1902. Serial No. 95,026. (No model.)



Claim.—1. A can-washer, comprising a frame 2 adapted to support a can in a horizontal position, a frame 20 provided near said frame 2, a rod substantially square in cross-section mounted on said frame 20, a fixed and a movable head provided on said rod, a collapsible frame pivotally connected with said heads and provided with a series of brushes, springs for normally holding said frame in its expanded position, means for revolving said rod and brush-frame, and a lever device provided on said frame 20 and having an arm to engage said sliding head to reciprocate it toward or from said fixed head, for the purpose specified.

2. The combination, with a suitable frame 2 adapted to support a milk-can in a horizontal position, of a frame 20 movable toward or from the open end of the can, guide-rails between which said frame 20 is slidable, a rod provided with a suitable crank and mounted in bearings on said frame 20 and adapted to be projected into the mouth of the can, fixed and movable heads provided on said rod, a collapsible brush-frame pivotally connected with said heads and provided with a series of brushes, a lever 26, and a hook 28 provided on said lever and adapted to engage said movable head to draw it lengthwise away from said fixed head when said lever is operated to collapse said brush-frame.

3. A can-washer, comprising a frame whereon the can is supported in a substantially horizontal position, a frame 20, guide-rails whereon said frame 20 is slidable toward or from the mouth of the can, a rod mounted in bearings on said frame 20, fixed and movable heads provided on said rod, a brush-frame provided with a series of brushes pivotally connected with said heads, springs for normally holding said brush-frame in its expanded position and allowing it to collapse and be removed from the can when said movable head is pushed or drawn away from said fixed head, substantially as described.

4. A can-washer, comprising a fixed frame adapted to support a can in a horizontal position, a sliding frame adapted to be moved toward or from the mouth of a can supported on said fixed frame, a rod mounted in bearings on said sliding frame, a fixed and a sliding head provided on said rod, a collapsible brush-frame pivotally connected with said heads and carrying a series of brushes, springs for normally holding said brush-frame in its expanded position, a crank provided on said rod for revolving the same, and means provided near said crank for drawing said movable head toward said sliding frame to collapse said brush-frame.

5. A can-washer, comprising a suitable frame adapted to support a can in a horizontal position, a rod, a fixed and a movable head provided on said rod, arms 9, 14 and 16 arranged in pairs and pivotally connected together and to said heads, brushes carried by said arms and adapted to engage the inner walls of the can, springs for normally holding said arms in their expanded position and permitting them to be drawn in toward said rod when said movable head is moved away from said fixed head, an adjustable support for said rod, and means for revolving said rod therein.

705,184. METHOD OF FORMING ELASTIC AND YIELDABLE MATERIAL IN BALES OF CUBIC OR SQUARE SHAPE. FREDERICK B. POPE, Augusta, Ga., and GILES D. MIMS, Parksville, S. C.; said Mims assignor to said Pope. Filed Oct. 14, 1899. Serial No. 733,589. (No model.)

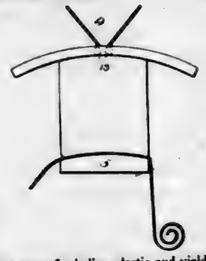
Claim.—1. The method of compressing elastic and yieldable material in rectangular bales of high density, which consists in compressing the material under great pressure in a curved form having the top and bottom both curved in the same direction.

2. The method of compressing elastic and yieldable material in rectangular bales of high density, which consists in compressing the material under great pressure in a curved form having the top and bottom both curved in the same direction, and in tying or binding the bale while under pressure.

3. The method of compressing elastic and yieldable material in rectangular bales of high density, which consists in compressing the material in a bat or blanket, lapped under great pressure, in a curved form having the top and bottom both curved in the same direction.

4. The method of compressing elastic and yieldable material in rectangular bales of high density, which consists in compressing the material in a bat or blanket, lapped under great pressure, in a curved form having the top and bottom both curved in the same direction, and in tying or binding the bale while under pressure.

705,185. APPARATUS FOR MAKING CUBIC OR SQUARE BALES, &c. FREDERICK B. POPE, Augusta, Ga., and GILES D. MIMS, Parksville, S. C.; said Mims assignor to said Pope. Filed Oct. 14, 1899. Serial No. 733,590. (No model.)



Claim.—1. In a press for baling elastic and yieldable material into rectangular bales, means consisting of two curved restraining-surfaces,

both being curved in the same direction, between which the bale is compressed.

2. In a press for baling elastic and yieldable material into rectangular bales, means consisting of two restraining, parallel surfaces of curved configuration, between which the bale is compressed.

3. In a press for baling elastic and yieldable material into rectangular bales, means consisting of two restraining, parallel surfaces of curved configuration, between which the bale is compressed, and means for introducing the material between said surfaces.

4. In a press for baling elastic and yieldable material into rectangular bales, two restraining, parallel surfaces of curved configuration, and means for introducing the material between said surfaces through one of said surfaces.

5. In a press for baling elastic and yieldable material into rectangular bales, two restraining, parallel surfaces of curved configuration, and means for oscillating one of said surfaces across the face of the other in a path of movement identical with the path of said surface.

6. In a press for baling elastic and yieldable material into rectangular bales, two restraining parallel surfaces of curved configuration, a pivot, and means for oscillating one of said surfaces upon the pivot across the face of the other in a path of movement identical with the path of said surface, substantially as set forth.

7. In a press for baling elastic and yieldable material into rectangular bales, a curved lapping-frame, a curved baling-platform, parallel thereto, and means for imparting relative oscillatory movement to said lapping-frame and baling-platform.

8. In a press for baling elastic and yieldable material into rectangular bales, a curved lapping-frame, a curved baling-platform, both being curved in the same direction, and means for imparting relative oscillatory movement to said lapping-frame and baling-platform.

9. In a press for baling elastic and yieldable material into rectangular bales, a curved lapping-frame formed of rolls, a curved baling-platform, both being curved in the same direction, and means for imparting relative oscillatory movement to said lapping-frame and baling-platform.

10. In a press for baling elastic and yieldable material into rectangular bales, a curved lapping-frame formed of two series of rolls, a curved baling-platform, both being curved in the same direction, and means for imparting relative oscillatory movement to said lapping-frame and baling-platform.

11. In a press for baling elastic and yieldable material into rectangular bales, a curved lapping-frame, a curved baling-platform, both being curved in the same direction, means for pressing said platform into engagement with said lapping-frame, and means for imparting relative oscillatory movement to said lapping-frame and baling-platform.

12. In a press for baling elastic and yieldable material into rectangular bales, a curved lapping-frame formed of rolls, a curved baling-platform, both being curved in the same direction, means for pressing said platform into engagement with said lapping-frame, and means for imparting relative oscillatory movement to said lapping-frame and baling-platform.

13. In a press for baling elastic and yieldable material into rectangular bales, a curved lapping-frame formed of two series of rolls, a curved baling-platform, both being curved in the same direction, means for pressing said platform into engagement with said lapping-frame, and means for imparting relative oscillatory movement to said lapping-frame and baling-platform.

14. In a press for baling elastic and yieldable material into rectangular bales, a curved lapping-frame, a curved baling-platform, both being curved in the same direction, a hydraulic cylinder for pressing said platform into engagement with said lapping-frame, and means for imparting relative oscillatory movement to said lapping-frame and baling-platform.

15. In a press for baling elastic and yieldable material into rectangular bales, a curved lapping-frame formed of rolls, a curved baling-platform, both being curved in the same direction, a hydraulic cylinder for pressing said platform into engagement with said lapping-frame, and means for imparting relative oscillatory movement to said lapping-frame and baling-platform.

16. In a press for baling elastic and yieldable material into rectangular bales, a curved lapping-frame formed of two series of rolls, a curved baling-platform, both being curved in the same direction, a hydraulic cylinder for pressing said platform into engagement with said lapping-frame and means for imparting relative oscillatory movement to said lapping-frame and baling-platform.

17. In a press for baling elastic and yieldable material into rectangular bales, a press-frame, a baling-platform supported thereby, said baling-platform having a curved upper face, a curved lapping-frame, and means for oscillating said lapping-frame across the face of the baling-platform in a path parallel thereto, substantially as set forth.

18. In a press for baling elastic and yieldable material into rectangular bales, a press-frame, a baling-platform supported thereby, said baling-platform having a curved upper face, a curved lapping-frame carrying baling means, and means for oscillating said lapping-frame across the face of the said baling-platform in a path parallel thereto, substantially as set forth.

19. In a press for baling elastic and yieldable material into rectangular bales, a press-frame, a baling-platform carried thereby, the working face of said platform being curved, a curved lapping-frame, and means for oscillating said lapping-frame across the face of the said baling-platform in a path parallel thereto, substantially as set forth.

20. In a press for baling elastic and yieldable material into rectangular bales, a press-frame, a baling-platform carried thereby, the working face of said platform being curved, a curved lapping-frame, a series of baling-rolls carried thereby, and means for oscillating said lapping-frame across the face of the said baling-platform in a path parallel thereto, substantially as set forth.

21. In a press for baling elastic and yieldable material into rectangular bales, a press-frame, a pressure-cylinder therein carrying a piston, a baling-platform carried thereon, the said baling-platform having a curved upper face, a curved lapping-frame parallel thereto, and means for imparting oscillatory movement to said baling-platform and lapping-frame, substantially as set forth.

22. In a press for baling elastic and yieldable material into rectangular bales, a press-frame, a pressure-cylinder therein carrying a piston, a baling-platform carried thereon, the said baling-platform having a curved upper face, a curved lapping-frame parallel thereto, a series of rolls carried therein, and means for imparting relative oscillatory movement to said baling-platform and lapping-frame, substantially as set forth.

23. In a press for baling elastic and yieldable material into rectangular bales, a baling-platform, a lapping-frame, distance-bars connected with said lapping-frame and pivoted below said platform, and means for oscillating said lapping-frame across the face of the said baling-platform, substantially as set forth.

24. In a press for baling elastic and yieldable material into rectangular bales, a baling-platform, a lapping-frame, a series of baling-rolls carried thereby, distance-bars connected with said lapping-frame and pivoted below said platform, and means for oscillating said lapping-frame across the face of the said baling-platform, substantially as set forth.

25. In a press for baling elastic and yieldable material into rectangular bales, a press-frame, a pressure-cylinder therein carrying a piston, a baling-platform carried thereon, a lapping-frame and distance-bars connected to said lapping-frame and pivoted to the press-frame adjacent to the cylinder, substantially as set forth.

26. In a press for baling elastic and yieldable material into rectangular bales, a press-frame, a baling-platform supported thereby, the said baling-platform having a curved upper face, a curved lapping-frame, distance-bars connected to said lapping-frame and pivoted to said press-frame, and means for oscillating said lapping-frame across the face of the said baling-platform in a path parallel thereto, substantially as set forth.

27. In a press for baling elastic and yieldable material into rectangular bales, a press-frame, a pressure-cylinder carried therein, carrying a piston, a baling-platform carried thereon, the said baling-platform having a convexly-curved upper face, a curved lapping-frame parallel thereto, and distance-bars connected to said lapping-frame and pivoted to the press-frame adjacent to the cylinder, substantially as set forth.

28. In a press for baling elastic and yieldable material into rectangular bales, a press-frame, a curved baling-platform supported thereby, a curved lapping-frame, a series of baling-rolls carried thereby, means for oscillating said lapping-frame across the face of the said baling-platform in a path parallel thereto, and means for positively rotating said rolls.

29. In a press for baling elastic and yieldable material into rectangular bales, a press-frame, a curved baling-platform supported thereby, a curved lapping-frame, a series of baling-rolls carried thereby, means for oscillating said lapping-frame across the face of the said baling-platform in a path parallel thereto, and connections between said press-frame and rolls for positively rotating the latter.

30. In a press for baling elastic and yieldable material into rectangular bales, a press-frame, a curved baling-platform supported thereby, a curved lapping-frame, a series of baling-rolls carried thereby, means for oscillating said lapping-frame across the face of the said baling-platform in a path parallel thereto, a toothed rack secured to the press-frame, and a series of gears or pinions secured to said rolls and engaging with said racks, whereby the said rolls will be positively rotated.

31. In a press for baling elastic and yieldable material into rectangular bales, a press-frame, a baling-platform supported thereby, a lapping-frame having a slot therein, a tongue on each end of the press-frame and engaging with the lapping-frame, and means for oscillating said lapping-frame across the face of the platform in a path parallel thereto, whereby said slot will alternately engage with each tongue.

32. In a press for baling elastic and yieldable material into rectangular bales, a press-frame, a baling-platform supported thereby, a lapping-frame having a slot therein, a spring-elevated tongue on each end of the press-frame and engaging with the lapping-frame, and means for oscillating said lapping-frame across the face of the said baling-platform, in a path parallel thereto, whereby the slot will alternately engage with each tongue.

33. In a press for baling elastic and yieldable material into rectangular bales, a lapping-frame therefor comprising two sets of pressing-rolls, and two parallel angle-bars between the sets, the said angle-bars having their sharp faces toward each other and separated to form a narrow slit between the same, substantially as set forth.

34. In a press for baling elastic and yieldable material into rectangular bales, a lapping-frame therefor comprising two sets of pressing-rolls, and two parallel angle-bars between the sets, the said angle-bars having their sharp faces toward each other and separated to form a narrow slit between the same, and a hopper arranged above the slit, substantially as set forth.

35. In a press for baling elastic and yieldable material into rectangular bales, a press-frame, a baling-platform supported thereby, the said baling-platform having a curved upper face covered with an elastic, rough substance, a curved lapping-frame, distance-bars connected to said lapping-frame and pivoted to said press-frame, and means for oscillating said lapping-frame across the face of the said baling-platform in a path parallel thereto, substantially as set forth.

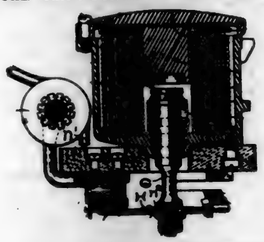
36. In a press for baling elastic and yieldable material into rectangular bales, a press-frame, a baling-platform supported thereby, the said baling-platform having a curved upper face covered with felt, a curved lapping-frame, distance-bars connected to said lapping-frame and pivoted to said press-frame, and means for oscillating the said lapping-frame across the face of the said baling-platform in a path parallel thereto, substantially as set forth.

37. In a press for baling elastic and yieldable material into rectangular bales, a press-frame, a baling-platform supported thereby, the said baling-platform having a curved upper face, a forming-chamber surrounding said baling-platform and having separable sides and ends, a curved lapping-frame, distance-bars connected to said lapping-frame and pivoted to the press-frame, and means for oscillating said lapping-frame across the face of the said baling-platform in a path parallel thereto, substantially as set forth.

38. In a press for baling elastic and yieldable material into rectangular bales, a press-frame, a baling-platform supported thereby, the said baling-platform having a curved upper face, a curved lapping-frame, distance-bars connected to said lapping-frame and pivoted to the press-frame, pitmen for oscillating the said lapping-frame across the face of the said baling-platform in a path parallel thereto, a crank-shaft connected with said pitmen, supporting-boxes for the crank-shaft, and braces connecting said crank-shaft and the press-frame, adjacent to the lapping-frame, substantially as set forth.

39. In a press, the combination with a press-frame, a lapping-frame carried thereon, said lapping-frame being formed of a continuous series of closely-spaced rolls, with a narrow slot through which the cotton is fed, a pivot on the press-frame for supporting said lapping-frame, means for oscillating the frame on the pivot, a movable platen, and means for interposing an adequate resistance to the receding of the platen to effect the entire compression of the bale in increments as the cotton is fed within the press, and lapped between the lapping-frame and platen, substantially as described.

705,186. ELECTROMAGNETIC SWITCH FOR SURFACE-CONTACT ELECTRIC-RAILWAY SYSTEMS. WILLIAM B. POTTER, Schenectady, N. Y., assignor to General Electric Company, a Corporation of New York. Filed Oct. 11, 1897. Serial No. 654,798. (No model.)



Claim.—1. The combination in a surface-contact electric-railway system, of electromagnetic switches for completing the circuit from the feeder to different surface contacts, consisting of three stationary and three moving contacts arranged at three corresponding points around a central core supporting the moving contacts, the moving and stationary contacts being free to adjust themselves and compensate for wear, and a magnet for lifting the moving contacts into engagement with the fixed contacts.

2. The combination in a surface-contact electric-railway system, of a feeder and surface contacts with electromagnetic switches for making the circuit connections between the feeder and surface contacts, comprising three fixed and three moving contacts angularly spaced around a center and free to adjust themselves so as to compensate for wear at the contact-points.

3. In an electric switch, the combination of a plurality of stationary contacts angularly displaced, a magnet, moving contacts for engagement with the stationary contacts, and a self-adjusting support for the moving contacts, which is actuated by the magnet.

4. In a surface-contact electric-railway system, the combination of stationary switch-contacts angularly displaced and connected to contacts located in the roadway and the source of supply, moving contacts also angularly displaced and adapted to complete the circuit through the stationary contacts, a self-adjusting support for the moving contacts, and a solenoid-magnet for moving the support.

5. In an electromagnetically-operated electric switch, the combination of a plurality of stationary contacts angularly displaced, a solenoid-magnet, moving contacts controlled by the solenoid, and a self-adjusting spring-support for the moving contacts.

6. In an electric switch, the combination of three stationary contacts angularly displaced, three moving contacts similarly displaced, a solenoid-magnet for actuating the moving contacts, a spring-support to which the moving contacts are secured, and a ball-and-socket joint between the support and the magnet-core.

7. In an electric switch, the combination of a base, contacts angularly displaced mounted thereon, an iron-clad solenoid-magnet also mounted on the base, a core for the solenoid, a spring-support carried by the core, and angularly-displaced contacts secured to the moving support for completing the circuit of the fixed contacts.

8. In an electric switch, the combination of a base, stationary contacts mounted on the base and angularly displaced, a solenoid-magnet, a sheet-metal support carried by the core, insulation between the core and the support, and contacts on the support adapted to engage with the stationary contacts.

9. As an article of manufacture, a support for a three-point switch, comprising a punching having three radially-extending arms with contact-clamps located at their outer ends.

10. As an article of manufacture, a support for a three-point switch, comprising a punching having strengthening-ribs, three radially-extending arms formed with contact-clamps at their outer ends, and a central rounded depression forming a portion of a ball-and-socket joint.

11. In a surface-contact electric railway, the combination of contacts located along the line of travel, a source of supply, electromagnetically-operated switches for closing and opening the circuit between the contacts and the source of supply, and a closed conductor surrounding the core of each switch-magnet to decrease the arcing at the surface contacts.

12. In a surface-contact electric-railway system, the combination of contacts located in the surface of the roadway, a source of supply, fixed and moving contacts for making and breaking the circuit between the surface contacts and the source of supply, an iron-clad magnet for actuating the moving contacts, and a closed copper band surrounding the core of the magnet to decrease the arcing at the surface contact when its circuit is interrupted.

13. In an electric railway, the combination with the feeder, of power-conductor sections, switches for connecting the latter with the former, electromagnets for actuating the switch-energizing conductor-sections, the coils of the magnets being connected with the latter sections, a contact-shoe carried by the car for engaging the latter sections to close the circuit through the coils, and a closed conductor in inductive relation to the electromagnet for decreasing the arcing between the switch-energizing sections and the contact-shoe.

14. In combination with a magnet-coil, a magnetic casing for the coil, a cover for the casing and formed integral with a fixed core, a movable core, and a cap of non-magnetic material interposed between said fixed and movable cores.

15. In combination with a magnet-coil, a magnetic casing for the coil, including an integral fixed core having a recessed end, a movable core having its end shaped to fit into said recess, and a cap of non-magnetic material interposed between said fixed and movable cores.

16. In combination, a fixed core, a movable core, an energizing-coil surrounding said cores, a casing of magnetic material inclosing said coil, a bushing of non-magnetic material surrounding said movable core, and a cap of non-magnetic material interposed between said fixed and movable cores.

17. In an electric switch, the combination with an insulating-base, of terminals secured to one side thereof, an electromagnet mounted on

the opposite side of the base, a perforation in the base through which the movable member of the magnet extends, and switch-contacts carried by the movable member of the magnet, which engage the terminals mounted on the base when the movable member is caused to be moved by the energizing of the magnet.

18. In an electromagnet, the combination with a central hollow support, of a coil mounted thereon, a cup-shaped case of magnetic material for the coil consisting of a single casting, a cover therefor of magnetic material which has an integral portion forming a stationary core extending within the hollow support, and a movable core extending within the hollow support and through a perforation in the bottom of the case.

19. In an electromagnetic switch, the combination with the electromagnet, of a magnetic casing surrounding said magnet, an insulating-base to which said casing is secured, fixed contacts secured to the opposite side of said base, a movable magnet member operating through said magnet-casing, movable contacts, and a resilient sheet-metal support which carries said contacts and is mounted on the movable magnet member, whereby the support will yield when the electromagnet draws the movable contacts against the fixed contacts.

20. In an electromagnetic switch, the combination with a perforated stationary support, of an electromagnet-coil mounted on one side of the support, contacts fixed on the other side of the support, a movable magnet-core which extends through the support and movable contacts, a resilient sheet-metal support which carries said contacts and is mounted on said core, whereby the support will yield when the electromagnet draws the movable contacts against the fixed contacts.

21. In an electromagnetic switch, the combination with the electromagnet, of fixed contacts, a movable magnet member, movable contacts, and a resilient sheet-metal punching provided with strengthening-ribs which carries said contacts and is mounted on said magnet member, whereby the resilient punching will yield when the electromagnet draws the movable contacts against the fixed contacts.

22. In an electromagnetic switch, the combination with the electromagnet, of fixed contacts, a movable magnet member, movable contacts, and a resilient punching provided with radial arms which carry said contacts, said punching being mounted on said movable magnet member, whereby the punching will yield when the electromagnet draws the movable contacts against the fixed contacts.

23. In combination, a fixed magnet-core, a movable magnet-core, an energizing-coil surrounding said cores, a casing of magnetic material surrounding said coil, and a bushing of non-magnetic material separating said movable core from said casing.

24. In an electromagnetic switch, the combination with the electromagnet, of fixed contacts, a movable magnet member, movable contacts, and a resilient punching having upturned portions for retaining said contacts and mounted on said movable magnet member, whereby the punching will yield when the electromagnet draws the movable contacts against the fixed contacts.

25. In an electromagnetic switch, the combination with the electromagnet, of one or more fixed metallic contacts, a movable magnet member, one or more movable contacts consisting of small blocks of carbon, and corresponding arms of resilient material suitably supported by the movable magnet member, said movable contacts being directly mounted on said resilient arms.

26. In an electromagnetic switch, the combination with a magnet-spool, of a magnet-coil wound thereon, a perforated cup-shaped magnetic casing, a cover therefor formed integral with a stationary core which extends inside the spool, fixed switch-contacts, a movable core which extends inside the spool through the perforation in the casing, and which carries the switch-contacts, and a non-magnetic bushing separating the movable core from the walls of the perforation in the magnetic casing, and extending inside the core to serve as a support for the movable core when the coil is not energized.

27. In an electromagnetic switch, the combination with a magnet-coil, of a magnetic casing therefor, a movable core extending into the coil through the casing, switch-contacts carried by the movable core, and a bushing of non-magnetic material for separating said core from the magnetic casing.

28. In an electromagnetic switch, the combination with the magnet-coil, of a plurality of fixed switch-contacts, a movable magnet member, a plurality of radial resilient arms supported directly upon said movable magnet member, and a plurality of switch-contacts mounted on said resilient arms to engage said fixed switch-contacts, whereby the resilient arms will yield to reduce the hammer-blow.

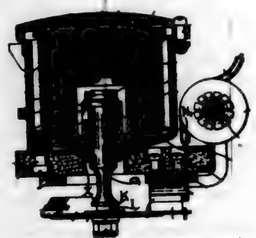
29. In an electromagnetic switch, the combination with the magnet-coil, of a fixed switch-contact, a movable magnet member, a resilient arm supported directly on said movable member, and a switch-contact mounted on said resilient arm to engage said fixed switch-contact, whereby the resilient arm will yield to reduce the hammer-blow.

30. In an electromagnetic switch, the combination with the electromagnet, of a suitably-supported switch-contact, a contact-support secured to the movable member of the magnet so as to have no independent longitudinal movement, a second switch-contact carried by said support and adapted to engage the first switch-contact, and means whereby a contact can yield when the contacts are caused to mutually engage.

31. In an electromagnetic switch, the combination with the electromagnet, of a suitably-supported switch-contact, a contact-support supported directly upon the movable member of the magnet, a second switch-contact carried by said support, and means between the second contact and the point of attachment of its support to the movable magnet member, whereby the second contact can yield when it engages the first.

32. In an electromagnetic switch, the combination with the electromagnet, of a suitably-supported switch-contact, a contact-support supported directly upon the movable magnet member, a second switch-contact carried by said support, and means between the second contact and the point where its support is mounted, whereby the second contact can yield when it engages the first.

705,137. ELECTRIC SWITCH. WILLIAM B. POTTER, Schenectady, N. Y., assignor to General Electric Company, a Corporation of New York. Filed July 27, 1900. Renewed Apr. 28, 1902. Serial No. 104,321. (No model.)



Claim.—1. In an electric switch, the contacts of which are liable to stick, owing to arcing, the combination with the movable switch portion, of an actuator therefor, having a lost-motion connection therewith, whereby in opening the switch the actuator can have a free movement at first, and will then, if the contacts are stuck together, impinge against the switch portion to positively force the switch-contacts apart, against their tendency to stick.

2. In an electric switch, the contacts of which are liable to stick, owing to arcing, the combination with the movable switch portion, of an actuator therefor, having a lost-motion connection therewith, and non-mechanical means for moving the switch portion and holding it in the position to which it may have been moved, to close the switch and maintain it closed, whereby when said means is made inoperative the actuator can have a free movement at first, and will then, in case they cohere, impinge against the switch portion to positively force the switch-contacts apart.

3. In an electric switch, the contacts of which are liable to cohere, owing to arcing, the combination with the movable switch portion, of an actuator therefor, having a lost-motion connection therewith, said actuator being normally maintained by gravity in a position to maintain the switch open, and means for lifting the actuator and switch portion and holding them in their raised position, to close the switch and maintain it closed, whereby, when said means is rendered inoperative, the actuator can move by gravity freely at first, and will then, if the contacts adhere, one to the other, impinge against the switch portion to positively open the switch.

4. In an electric switch, the contacts of which are liable to adhere, owing to arcing, the combination with the movable switch portion, of an electromagnet for moving the switch portion to close the switch, the movable portion of the magnet having a lost-motion connection with said movable switch portion, whereby, when the magnet-coil is open-circuited, the movable magnet portion can have a free movement at first, and will then, if one contact adheres to the other, impinge against the movable switch portion to open the switch, by forcing the contacts apart.

5. In an electric switch, the contacts of which are liable to stick, owing to arcing, the combination with the movable switch portion, normally maintained in its open position by gravity, of an electromagnet for lifting said portion to close the switch, the movable portion of the magnet having a lost-motion connection with the switch portion, whereby, when the magnet-coil is open-circuited, the movable magnet portion moves freely by gravity at first, and then, if the switch-contacts are stuck together, impinges against the movable switch portion to positively separate the contacts.

6. In an electric switch, the contacts of which are liable to be caused to cohere by arcing, the combination with the movable switch portion, of an electromagnet, the movable portion of which has a lost-motion connection with the switch portion, said magnet portion and switch portion being normally maintained by gravity in a position to maintain the switch open when the magnet-coil circuit is open, and non-magnetic material between the movable magnet portion and the other parts of the magnet, to prevent sticking of the movable magnet portion in its raised position after the magnet-coil is open-circuited, whereby it is certain that the movable magnet portion will descend by gravity, freely at first, owing to the lost-motion connection, and will then, in case the contacts are sticking, impinge upon the movable switch portion to positively separate the switch-contacts.

7. In an electric switch, the contacts of which are liable to stick, owing to arcing, the combination with the movable switch portion, of an actuator therefor having a lost-motion connection therewith in the direction of motion of the actuator, the switch portion being immovable except in the direction of the motion of the actuator.

8. In an electric switch, the contacts of which are liable to stick, owing to arcing, the combination with the movable switch portion, of an electromagnet, the movable portion of which has a lost-motion connection with the switch portion, the switch portion being immovable except in the direction of motion of the movable magnet portion, whereby, when the magnet-coil is open-circuited, the movable portion of the magnet can have a free movement at first, and will then, if the contacts stick, impinge against the movable switch portion to open the switch.

9. In an electric switch, the contacts of which are liable to stick, owing to arcing, the combination with the movable switch portion, of an electromagnet, the movable portion of which has a lost-motion connection with the switch portion, the switch portion being immovable except in the direction of motion of the movable magnet portion, and means for preventing any movement of the latter except back and forth in the path through which it is drawn by its coil, whereby, when the magnet-coil is open-circuited, the movable portion of the magnet can have a free movement at first, and will then, in case the contacts are stuck together, impinge against the movable switch portion to open the switch.

10. In an electric switch, the contacts of which are liable to stick, owing to arcing, the combination with a movable switch portion made of resilient material, the resiliency of which prevents severe impact in closing, of an electromagnet, the movable portion of which has a lost-motion connection with the switch portion, whereby, when the magnet-coil is open-circuited, the movable magnet portion can have a free movement at first, and will then, if the contacts are stuck together, impinge against the resilient switch portion, to exert upon the sticking contacts strains both parallel and transverse to the direction of motion of the movable magnet portion.

11. In an electric switch, the contacts of which are liable to stick, owing to arcing, the combination with the line-terminals, of carbon switch-contacts, a resilient support therefor which yields in closing to prevent injury to the carbons, a support for the carbon contacts, and an electromagnet, the movable portion of which has a lost-motion connection with the support, whereby, when the magnet-coil is open-circuited, the movable magnet portion can have a free movement at first, and will then impinge against the resilient switch portion to force the carbons across and away from the surfaces of the line-terminals.

12. The combination with an electric switch, the contacts of which are liable to be caused by arcing to be stuck together, of means for opening the switch whereby, in case the contacts are stuck together, a hammer-blow is automatically delivered to separate them, but no blow is delivered in case the contacts are not stuck together.

13. The combination with an electric switch, of an electromagnet for closing the same, and a mass of magnetic material which falls by gravity against the switch when the magnet-coil is open-circuited, to force the switch open.

14. The combination with an electric switch, the contacts of which are liable to be caused by arcing to be stuck together, of an electromagnet for closing the same, and a magnetic hammer which falls by gravity when the magnet-coil is open-circuited, and impinges upon the switch to open the same, only in case the switch is held closed by the coherence of the contacts.

15. The combination with an electric switch, the contacts of which are liable to be caused by arcing to be stuck together, of an electromagnetic hammer which falls by gravity, and impinges upon the switch to open the same when the magnet-coil is open-circuited, and a step-rest for the hammer which permits the hammer to fall through and below the space occupied by the switch in its closed position.

16. In an electric switch, the contacts of which are liable to be caused by arcing to be stuck together, the combination with the movable switch portion, of an electromagnet, the movable portion of which is provided with a shoulder, and means for holding the movable switch-piece so that it can move freely on the movable magnet portion below the shoulder, whereby, when the magnet-coil is open-circuited, the magnet portion falls by gravity, and in case the contacts are stuck together its shoulder impinges upon the switch portion, to open the switch, and means for limiting the fall of the movable magnet portion.

17. In an electric switch, the contacts of which are liable to be caused by arcing to be stuck together, the combination with the movable switch portion, of an actuator therefor having a portion with a non-circular periphery, said switch portions fitting over said non-circular portion, to prevent rotation, and having a lost-motion connection with said actuator in the direction of motion of the latter, said actuator being normally maintained by gravity in a position to maintain the switch open, and means for lifting the actuator and switch portion and holding them in their raised position, to close the switch and maintain it closed, whereby, when said means is rendered inoperative, the actuator can gravitate freely at first, and will then, if the contacts are stuck together, impinge against the switch portion to positively open the switch.

18. In an electric switch, the contacts of which are liable to stick, owing to arcing, the combination with the movable switch portion, of means for delivering a hammer-blow thereto, to separate the sticking contacts, and an electromagnet for closing said switch and controlling said means, the latter being operative when the magnet-coil is open-circuited.

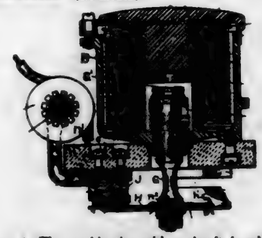
19. In an electric switch, the contacts of which are liable to stick together, owing to arcing, the combination with the movable switch portion normally held by gravity in its open position, of an electromagnet for raising the switch portion to close the switch, and means for delivering a hammer-blow to the movable switch portion when the magnet-coil is open-circuited.

20. In an electric switch, the contacts of which are liable to stick together, owing to arcing, the combination with the movable switch portion, of means for delivering a blow thereto to separate the contacts in case they are stuck together, and an electromagnet which controls said means and permits it to be operated when the magnet-coil is open-circuited, and the contacts are stuck together.

21. The combination with an electric switch, normally held in its open position by gravity, of means whereby, when the switch is closed, a hammer-blow is automatically, in case the contacts are stuck together, delivered to the switch to force it open.

22. In an electric railway, the combination with the feeder, of a sectional conductor, a connection between each such section and the feeder, a switch for each such connection, and a switch-actuating, electrically-controlled device mechanically connected to said switches by a lost-motion joint.

705,138. BLOW-OUT MAGNET. WILLIAM B. POTTER, Schenectady, N. Y., assignor to General Electric Company, a Corporation of New York. Original application filed Oct. 11, 1897, Serial No. 654,793. Divided and this application filed Feb. 23, 1901. Renewed Apr. 23, 1902. Serial No. 104,322. (No model.)



Claim.—1. The combination with a circuit in which the current strength is subject to considerable variance, of a switch therein, any arcing at which it may be highly desirable to avoid, a permanent magnet of hard iron having a large amount of residual magnetism and coercive force, and an energizing-coil for the magnet which is connected in the circuit, whereby the permanent magnet coöperates with the coil, to blow out small destructive arcs at the switch when a small current is flowing through the circuit.

2. In an electric railway, the combination with the feeder, of branch connections from the feeder, a sectional conductor having its sections connected to the feeder branches, electromagnetic switches in the branches, the current-flow through which switches varies considerably from various reasons, magnets having a large amount of residual magnetism and coercive force, to remain permanent under adverse service conditions, and energizing-coils for the magnets, which coils are connected in the feeder branches, whereby the permanent magnets coöperate with the coils, to blow out small destructive arcs at the switches when only a small current is flowing through the feeder branches.

3. In an electric switch, the combination of fixed and moving contacts with an arc-disruptive means, comprising a permanent blow-out

magnet having an energizing-coil, the arrangement being such that the field of the permanent magnet is employed to disrupt the arc formed at times when the current flowing in the energizing-coil is insufficient to create a strong field, and a combined field, due to the permanent magnet and energizing-coil, for disrupting the arc formed at times when larger currents are flowing in the system.

4. In a switch, the combination with an insulating-base, of a switch-contact secured to the lower side of the base, and a blow-out magnet supported above the base by its pole-pieces, which are extended around said base on opposite sides of said contact, and are secured to the lower side of the base.

5. In a switch, the combination with an insulating-base, of a switch-contact secured to the lower side of the base by a screw extending from the upper side of the base, and a blow-out magnet having one end of its coil adapted to be connected to said contact by said screw.

6. In a switch, the combination with an insulating-base, of a switch-contact secured to the lower side of the base, and a blow-out magnet supported above said base by its pole-pieces, which are extended around the base and secured thereto on opposite sides of said contact, said pole-pieces having depending projections which extend down below the contact.

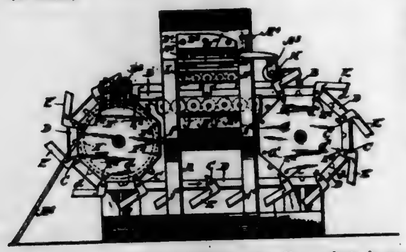
7. In an electric railway, the combination with the feeder, of conductor-sections, electromagnetic switches which may have a variable flow of current from their coils, for connecting the feeder with said sections, magnets having a large amount of residual magnetism and coercive force, and energizing-coils for said magnets which are connected between the feeder and the feeder-contacts of said electromagnetic switches, said permanent magnets coöperating with said magnet-coils to blow out small destructive arcs at the switch-contacts when a relatively small current is flowing through the blow-out magnet-coils.

8. In an electromagnetically-operated switch, the combination of a magnet, fixed terminals angularly displaced, moving contacts similarly displaced, a support to which the moving contacts are secured controlled by the magnet, and a permanent magnet provided with an energizing-coil arranged to blow out the arcs formed at one pair of contacts.

705,139. COMPOSITION FOR REMOVING PAINT OR VARNISH. FREDERICK PRIESTMAN, Burlington, Iowa. Filed Oct. 14, 1901. Serial No. 78,582. (No specimens.)

Claim.—The herein-described composition of matter for removing paint and varnish, consisting of sal-soda, water, fusel-oil, kerosene and aqua-ammonia substantially as described.

705,140. MACHINE FOR DISINTEGRATING FIBROUS PLANTS. MANUEL PRIETO, Mexico, Mexico. Filed Feb. 7, 1901. Serial No. 46,350. (No model.)



Claim.—1. In a machine for disintegrating fibrous plants, in combination with the scraping or beating mechanism thereof, an endless leaf-holding chain or carrier provided with a series of clamping-jaws hinged thereto and arranged to open and close by movements to and from the chain or carrier, a projection contacting with a portion of each jaw in a direction to hold the same open for the introduction of the leaves, and confining devices directly above and below the said chain or carrier and the said jaws, respectively, for keeping said jaws strongly closed while the leaves are carried past the said scraping or beating mechanism, substantially as described.

2. In a machine for disintegrating fibrous plants, in combination with the scraping or beating mechanism thereof, an endless leaf-holding chain or carrier provided on its periphery with a series of clamping-jaws hinged thereto by pivots transverse to the plane of motion of said chain or carrier and arranged to open and close by movements in said plane to and from the chain or carrier, a projection contacting with a portion of each jaw in a direction to hold the same open for the introduction of the leaves, and confining devices directly above and below the said chain or carrier and the said jaws, respectively, for keeping said jaws strongly closed while the leaves are carried past the said scraping or beating mechanism, substantially as described.

3. In a machine for disintegrating fibrous plants, in combination with a scraping or beating drum, and with its coöperating casing or bed, a pair of wheels mounted on shafts below the shaft of said drum and at right angles thereto, with the upper portions of said wheels about on a level with the said drum-shaft, an endless leaf-holding chain carried on said wheels, a series of clamping-jaws hinged to said chain by pivots transverse to the plane of the chain's motion so that said jaws open and close by movements in said plane to and from the chain, a device contacting with a portion of each jaw as the latter passes over the top of one of said wheels for holding the jaw open for the introduction of the leaves, and confining-devices directly above and below said chain and said jaws, respectively, for keeping said jaws strongly closed while the leaves are carried past the said drum and its said casing or bed, substantially as described.

4. The combination with means for scraping or beating, the endless leaf-holding chain, and the supporting-wheels, F and G, of the clamping-jaws, E, hinged to said chain and provided with horns E^3, and the projections or pins G^2 on the wheel G for holding the jaws open for the introduction of the leaves by contacting with the horns on said jaws, substantially as described.

5. The combination with the scraping or beating drum, its coöperating casing or bed, the side frames, the endless leaf-holding chain, and the opposing sets of confining devices mounted between said side frames, of the roller H independently mounted and arranged on the outer side of one of said frames in advance of both sets of said confining devices, substantially as described.

6. The combination with means for scraping or beating, and with the endless chain and its supporting-wheels F and G, of the clamping-jaws E hinged to said chain and provided with horns E^3, and the projections or pins F^3 on the wheel F for contacting with the horns on said jaws and thereby opening the jaws for the removal of the scraped or beaten leaves, substantially as described.

7. In a machine for disintegrating fibrous plants, in combination with a scraping or beating drum, and its coöperating casing or bed, a pair of wheels mounted on transverse shafts, an endless leaf-holding chain carried on said wheels with its upper portion about on a level with the axis of the said drum-shaft, a series of clamping-jaws hinged to said chain and provided with horns, projections or pins on each of said wheels for contacting with said horns in the direction for opening and holding open the jaws as the chain passes over the said wheels, respectively, and means for keeping the said jaws strongly closed while the leaves are carried past said drum and its said casing or bed, substantially as described.

8. In a machine for disintegrating fibrous plants, in combination with the scraping or beating mechanism thereof, an endless leaf-holding chain or carrier provided with a series of clamping-jaws hinged thereto and arranged to open and close by movements to and from the chain or carrier, devices contacting with portions of said jaws to open the same, respectively, before and after passing said scraping or beating mechanism, and confining devices directly above and below the said chain or carrier and the said jaws, respectively, for keeping said jaws strongly closed while the leaves are carried past the said scraping or beating mechanism, substantially as described.

705,141. FRUIT-PICKER. WILLIAM H. RAUCH, Wichita, Kans. Filed Dec. 21, 1901. Serial No. 86,540. (No model.)

Claim.—1. A fruit-picker comprising, a socket having upper and lower fixed apertured rings or collars on its outer side, a circularly-arranged series of outwardly-bowed spring-fingers having straight lower ends mounted in the apertures in both rings or collars and provided at their upper ends with eyes, and an operating-cord passed through said eyes to contract the fingers around the fruit, substantially as set forth.

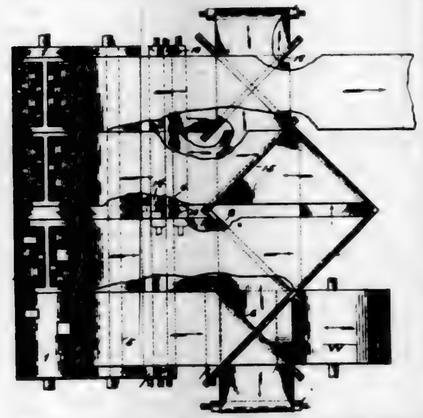
2. A fruit-picker, comprising a shank or socket provided with apertured rings or flanges at its ends, and a circularly-arranged series of spring-fingers each formed of a single wire bent upon itself, formed with an eye in its bend and having its lower ends passed through and secured to said apertured rings, and an operating-cord connected to said eyes to contract the fingers around the fruit.

3. A fruit-picker, comprising a socket, a series of bowed spring-fingers secured to the socket and having eyes at their upper ends; one of said fingers being of heavier material than the other, a cord secured to said heavier finger, thence passed through the eyes of the other fingers and finally through the eye of the heavier finger down to the operator.

4. A fruit-picker, consisting in the shank or socket, the bowed spring-fingers having eyes at their upper ends, a ring connecting the fingers between their ends, a sack or pocket suspended from said ring within the series of fingers, and a cord connected to the said eyes for contracting or closing the fingers

---

705,142. WEB-PRINTING MACHINE. GEORGE F. READ, New York, N. Y., assignor to Robert Hoe, New York, N. Y. Filed Nov. 27, 1901. Serial No. 83,632. (No model.)



Claim.—1. In a printing-machine, the combination with a pair of double-wide cylinders, of means for leading a single-wide web twice between the cylinders at one end thereof and twice between the cylinders at the other end thereof, and means for leading a double-wide web once between the cylinders at each end, substantially as described.

2. In a printing-machine, the combination with a pair of double-wide cylinders, of means for leading a single-wide web twice between the cylinders at one end with the same side up and twice between the cylinders at the other end with the other side up, and means for leading a double-wide web once between the cylinders at each end, substantially as described.

3. In a printing-machine, the combination with a pair of double-wide cylinders, of means for leading a single-wide web twice between the cylinders at one end with the same side up, and twice between the cylinders at the other end with the other side up, and means for leading a double-wide web once between the cylinders at one end, reversing it and leading it between the cylinders at the other end, substantially as described.

4. In a printing-machine, the combination with a pair of double-wide cylinders, of web-guides coöperating with one end of the cylinders whereby a single-wide web may be led twice therethrough, web-guides coöperating with the other end of the cylinder whereby said web may be led twice therethrough, and directing means for guiding the web from one end of the cylinder to the other end, said directing means being constructed to also guide a double-wide web from one end of the cylinders to the other, substantially as described.

5. In a printing-machine, the combination with a pair of double-wide cylinders, of web-guides coöperating with one end of the cylinders, web-guides coöperating with the other end of the cylinders, and web-directing means operating to lead the web from one end of the cylinder to the other, the construction being such that a single-wide web may be led twice between the cylinders at one end and twice between the cylinders at the other end, or a double-wide web may be led by said web-directing means once between the cylinders at each end, substantially as described.

6. In a printing-machine, the combination with a pair of double-wide cylinders, of web-guides coöperating with one end of the cylinder and constructed to lead a web twice therethrough the same side up, of web-directing means for leading said web from one end of the cylinder to the other, and web-guides coöperating with the other end of the cylinders to lead said web twice therethrough the same side up, said web-directing means being constructed to also lead a double-wide web from one end of the cylinders to the other, substantially as described.

7. In a printing-machine, the combination with a pair of double-wide cylinders, of web-guides coöperating with one end of the cylinder and constructed to lead a web twice therethrough the same side up, of web-directing means for turning the web over and leading said web from one end of the cylinder to the other, and web-guides coöperating with the other end of the cylinders to lead said web twice therethrough the same side up, said web-directing means being constructed to also lead a double-wide web from one end of the cylinders to the other and turn it over between the ends of the cylinders, substantially as described.

8. The combination with a pair of double-wide cylinders, of a set of guides operating to receive a single-wide web from one end of the cylinders, transfer it laterally and deliver it to the same end of the cylinders with its printed side toward the form-carrying cylinder, a set of web-guides coöperating in the same manner with the other end of the cylinders, and a pair of angle-bars over which the web runs as it passes from one end of the cylinders to the other, said bars being constructed to also receive a double-wide web from one end of the cylinders, turn it over, and deliver it to the other end of the cylinders, substantially as described.

705,143. ARTIFICIAL TOOTH. JAMES J. REYNOLDS, Huntington, W. Va. Filed Oct. 5, 1901. Serial No. 77,725. (No model.)

Claim.—1. The combination of the anchor having a pin, and a laterally-extending base-flange adapted to be embedded in the supporting-plate; with a tooth having a socket to engage the pin and a recess to fit over the base-flange and prevent turning of the tooth on the pin, substantially as described.

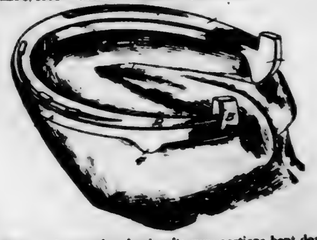
2. An anchor for artificial teeth having a tooth-engaging pin and opposite base-flanges extending laterally beyond the base of the attached tooth and adapted to be embedded in the tooth-support; with a tooth having a socket to engage the pin, and a recess in its base to fit over the adjoining portions of the base-flanges, all substantially as described.

3. The combination of the support having a tooth-socket, an anchor in each socket having opposite laterally-extending base-flanges projecting beyond the socket and embedded in the material of the support; with a tooth having a socket to engage the anchor-pins and recesses to fit over the base-flanges; said tooth being fitted into the socket of the support and secured to the anchor-pin by cement, substantially as described.

4. The combination of an artificial plate; with an anchor having a pin, and a laterally-extending base-flange adapted to be embedded in the plate, said anchor projecting beyond the base of the attached tooth, and a tooth having a socket to engage the pin substantially as described.

5. The combination of the artificial plate having a tooth-socket, the anchor in said socket having a pin in the socket and a laterally-extending base-flange projecting beyond the socket, and secured to the plate; with a tooth having a socket to engage the pin and seated in the socket of the support and secured to the pin, substantially as and for the purpose described.

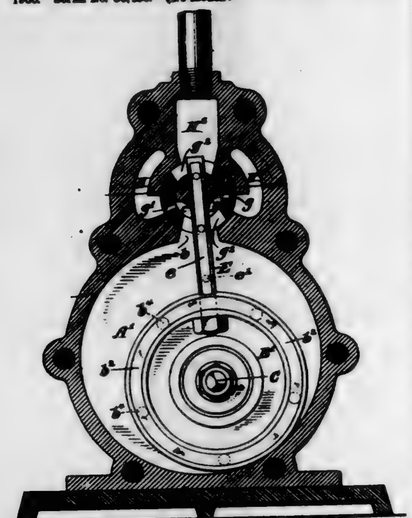
705,144. HORSESHOE. JOHN RICE, Fort Collins, Colo. Filed June 5, 1901. Serial No. 63,304. (No model.)



Claim.—A horseshoe having its rear portions bent downward from a point beginning approximately with the last nail-hole on each side of the shoe, thereby to hold the said portions normally out of engagement with the hoof of the animal when secured thereto, said portions being

provided with the usual hooks and with upward and inward inclined ears extending from the inner side edges of the heel portions, said ears converging toward each other and being approximately wedge-shaped in cross-section and adapted freely to move in the frog-crosses of the hoof when the shoe is applied, substantially as and for the purpose specified.

705,145. ENGINE. VIETTE L. REES, New York, N. Y., assignor, by mesne assignments, to C. J. Downing & Co., Inc. Filed Nov. 14, 1900. Serial No. 36,488. (No model.)

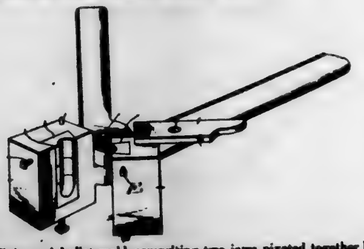


Claim.—1. The combination in an engine of side walls and a circumferential wall, the latter being provided with steam-chambers, a piston-chamber formed by said walls, a rotary piston in said piston-chamber, an admission-valve operated by said piston, a steam-chamber secured to one of said side walls and in communication with said steam-chambers, and an oscillating reversing-valve provided in said steam-chamber.

2. The combination in an engine of side walls and a circumferential wall, the latter being provided with live-steam chambers and an exhaust-chamber and one of said side walls being provided with openings which lead to said chambers, a steam-chamber inclosing said openings, an oscillating valve in said chamber which is movable over said openings and is provided with a channel which is adapted to be in communication with one or the other of said live-steam openings and the exhaust-opening, a rotary piston, and an admission-valve operated by said piston.

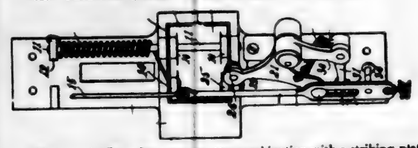
3. In an engine, the combination of a piston-cylinder, a steam-cut-off valve and an admission-valve therefor, a piston movable in the cylinder and mounted on a crank-pin, a shaft, and a crank-arm between said pin and shaft which is adjustable longitudinally, said crank comprising two parts dovetailed together so as to be movable one on the other and each provided with an opening, and a tapered key fitted in said openings.

705,146. BULLET-MOLD. HERMAN RICHTER, Cullman, Ala. Filed May 26 1902. Serial No. 109,035. (No model.)



Claim.—A bullet-mold, comprising two jaws pivoted together having square-shaped heads having dovetailed grooves on their inner faces, guide-pins carried by one jaw and adapted to interpose in the face of the adjacent jaw, a plurality of matrix-blocks mounted in each groove, an adjusting-screw mounted in the face of each jaw and adapted to bear against one of said matrix-blocks, and said adjusting-screws, one carried by each jaw, and a pivotal locking-plate apertured to register with the bore of the mold, as set forth.

705,147. DOOR-OPENER. GEORGE RICHMULLER, San Francisco, Cal. Filed Nov. 4, 1901. Serial No. 81,001. (No model.)



Claim.—1. In a door-opener, the combination with a striking-plate of a device movably supported thereon comprising a part arranged to engage the latch of the door and prevent inward movement thereof, and a part arranged to engage said door to swing the same on its hinges, and means for transmitting to said device from a distant point force applied at said distant point to withdraw the former part out of engagement with the latch and to press the latter part against the door to swing the same open, substantially as described.

2. In a door-opener, the combination with a striking-plate of a device movably attached thereto, comprising a part adapted to engage the latch of the door and prevent inward movement thereof, and a part arranged to engage the outer free edge of the door, and means for transmitting to said device from a distant point force applied at said distant point to withdraw the former part out of engagement with the latch and to press the latter part against the outer edge of the door to push the same open, substantially as described.

3. In a door-opener, the combination with the striking-plate of a door, of a dog pivotally mounted on said striking-plate, said dog having a lip arranged to engage the latch of the door when the door is closed, to prevent inward movement of the same, and having also an arm arranged to engage the outer free edge of the door, means for swinging said dog to remove said lip from engagement with the latch to release the latter and to press the arm against the outer free edge of the door to push the same open, and means for imparting to said swinging means from said distant point force applied at said distant point, substantially as described.

4. In a door-opener, the combination with the striking-plate of a door, of a dog having a lip arranged to engage the latch of the door, when the latter is closed, to prevent the opening of the door, a lever whereof an arm is attached to said dog to draw said lip away from said latch, and a wire extending to a distant point and suitably connected with said lever to actuate the dog to release said door, substantially as described.

5. In a door-opener, the combination with a striking-plate of a door, of a dog pivotally mounted thereon having a lip arranged to engage the latch of the door to prevent the opening of the door, and having also a device arranged to engage the door to thrust the same open when said dog is vibrated, a spring for normally throwing said dog inward toward said latch, a lever having an arm connected with said dog to swing the same upward, a locking-arm connected with another arm of said lever, said locking-arm engaging a suitable stop to prevent the outward swinging of said dog, and a link having a sliding connection with an arm of said lever and arranged first to operate said locking-arm to release the same and then to actuate said lever to swing said dog outwardly, substantially as described.

6. In a door-opener, the combination with a striking-plate of a door, of a dog pivoted thereon having a lip arranged to engage the latch of the door to prevent the opening of the door and having also a part arranged to engage said door to push the same open when the dog is moved, a lever, a link connecting one arm of said lever with said dog to swing the same, a locking-arm pivotally mounted upon another arm of said lever, a stop against which said locking-arm abuts to prevent the moving of said lever to swing the dog outwardly, and a vertically-moving link having a stud arranged to engage said locking-arm to withdraw the same and having also a slot to engage a stud on another arm of said lever, whereby, after a certain movement upward of said link, said link actuates said lever to release said dog from engagement with said latch, substantially as described.

705,148. ELECTRIC BATTERY. MARTIN W. ROBINSON, Medford, Mass. Filed May 11, 1901. Serial No. 59,775. (No model.)

Claim.—1. A cathode composed of a nickel-plated copper plate, having non-conducting buffers secured thereto in combination with intermediate zinc plates alternately arranged, substantially as described.

2. A cathode composed of perforated nickel-plated copper plates connected together by a binding-screw, and intermediate zinc plates, substantially as described.

3. A galvanic battery consisting of nickel-plated copper cathodes and zinc anodes immersed in a bath composed of bichromate of sodium and sulfuric acid, substantially as described.

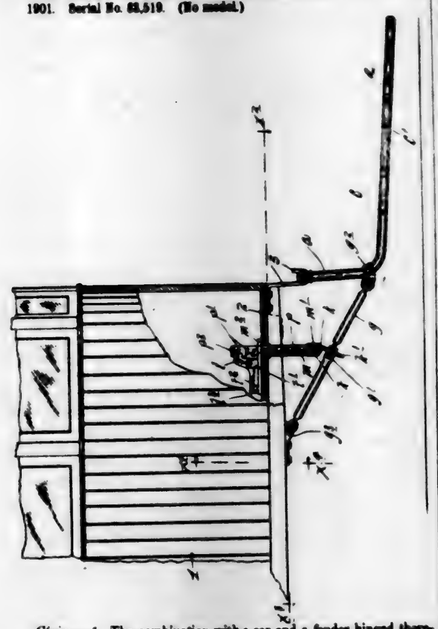
4. A galvanic battery consisting of perforated nickel-plated copper cathodes, secured together by a binding-screw, and zinc anodes secured together by a separate screw and arranged intermediate the cathodes, said elements being immersed in a bath composed of bichromate of sodium and sulfuric acid, substantially as described.

5. The herein-described battery elements, consisting of perforated copper plates coated with nickel and secured together by a binding-screw, and zinc plates located intermediate the copper plates and connected by a screw, and non-conducting buffers for holding the plates apart, substantially as described.

705,149. DISPLAY-HOLDER FOR NECKTIES. HENRY REUTZ, Chicago, Ill. Filed Feb. 7, 1902. Serial No. 93,040. (No model.)

Claim.—The combination with a common support of a plurality of tie-holding devices, each consisting of a sheet-metal element having a base *b*, permanently attached to said support, a rigid rearwardly-inclined body portion *c*, and the parts *f*, *g*, bent downwardly and upwardly respectively in substantially parallel planes, whereby the space between the two may serve to engage the fastener of a necktie substantially as described.

705,150. STREET-CAR FENDER. HENRY J. SCHULDT, St. Paul, Minn., assignor to Philip W. Herzog, St. Paul, Minn. Filed Nov. 25, 1901. Serial No. 83,519. (No model.)

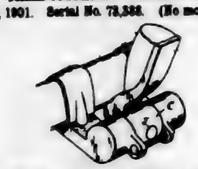


Claim.—1. The combination with a car and a fender hinged thereto, of a pair of toggle-levers for supporting said fender, and a combined trip and resetting device acting on said toggle-levers and involving a vertically-movable ratchet-plunger, and a cooperating lock-pawl, which pawl is released from the said plunger when stepped upon, and which plunger is adapted to be reset by the pressure of the foot, substantially as described.

2. The combination with a car and a fender hinged thereto, of a pair of toggle-levers for supporting said fender from the car-body, a pair of reversely-acting bell-crank levers pivotally connected to the car-body and connected, one to each of said toggle-levers, a vertically-movable ratchet-tooth plunger, working through the car platform or floor, and a cooperating lock-pawl, which pawl is adapted to be released from said plunger by the pressure of the foot, and which plunger is adapted to be pressed down, to raise the said fender, by the pressure of the foot, substantially as described.

3. A car-fender comprising the primary marginal frame or tube *a*, the secondary or inner marginal frame *b* following the interior of said tube or frame *a*, a filler secured to the said supplemental frame *b*, and the netted hooks or clamping-staples *c* engaging said frame *b* and passed through the said frame *a*, substantially as described.

705,151. THILL-COUPLING. CHARLES A. SMITH, Pinckney, Mich. Filed Aug. 28, 1901. Serial No. 73,388. (No model.)

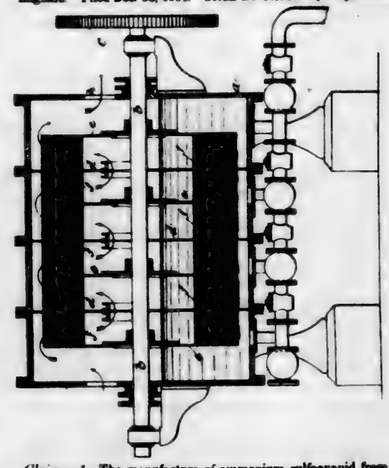


Claim.—1. A thill-coupling comprising a swivel-head having a socket formed centrally therethrough in the plane of the axis and a hook secured to the thill adapted to engage said socket.

2. A thill-coupling comprising a pair of cleats separately secured to the axle and having separate forwardly-projecting apertured arms, a socketed head having pintles engaging the apertures in said arms, a hook secured to the thill for engaging said socket and a clamping-bolt for drawing upon said arms to press the same against said swivel-head.

3. A thill-coupling comprising separated forwardly-projecting bearings clipped to the axle a rotary socketed head having pintles at opposite ends for engaging said bearings, a clamping-bolt for drawing said bearings together, a thill having a hook for engaging the socket in said head and a safety-strap secured to said thill and looping around said clamping-bolt.

705,152. METHOD OF MAKING SULPOCYANIDS FROM COAL GAS. HARRY W. SMITH, Sutton Coldfield, WILLIAM T. GIDDENS, Langley Green, near Birmingham, and ALFRED G. SALAMON, London, England, assignors to the British Cyanides Company, Limited, Oldbury, England. Filed Dec. 30, 1901. Serial No. 87,840. (No specimens.)



Claim.—1. The manufacture of ammonium sulfocyanid from coal-gas containing ammonia and cyanid compounds by washing the gas with water in the presence of sulfur and continuing the process with the same water after the said water has become fully saturated with ammonia.

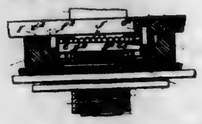
2. The process consisting in scrubbing coal-gas containing ammonia and cyanogen compounds with water in the presence of sulfur to obtain a solution of ammonium sulfocyanid and then again scrubbing the gas

which has been so treated with a much larger quantity of water to absorb the ammonia.

3. The process consisting in scrubbing with water coal-gas containing ammonia and cyanid compounds successively in a number of scrubbers containing sulfur and again scrubbing the gas leaving the last scrubber of the series with a much larger quantity of water to absorb the ammonia, drawing off strong solution of ammonium sulfocyanid from time to time from the first scrubber simultaneously transferring liquor from each of the other scrubbers to the scrubber next before it and adding water to the last scrubber.

4. The process consisting in scrubbing coal-gas containing ammonia and cyanogen compounds with water having ammonia in solution in the presence of sulfur to obtain a solution of ammonium sulfocyanid and then again scrubbing the gas which has been so treated with a much larger quantity of water to absorb the ammonia.

705,153. DRAG DEVICE FOR BOBBINS OF DRAWING AND SPINNING FRAMES. SAMUEL SMITH, Lawrence, Mass., assignor of one-half to Anna A. Peabody, Lawrence, Mass. Filed Aug. 25, 1899. Serial No. 728,400. (No model.)



Claim.—1. The combination of a live-spindle, a flier, attached to and rotating with said spindle, a friction-plate, adapted to support a bobbin and to be rotated by the rotation of said bobbin, a friction device adapted to press upon said plate, and means of varying the pressure of said friction device upon said friction-plate without varying the height of said spindle and bobbin.

2. The combination of a live-spindle, a flier, attached thereto and rotating with said spindle, a lifter-plate, provided with a threaded hole, a tube, externally threaded and turning in said hole and provided with a flange, and a friction-plate, supported on said flange and adapted to support and positively engage a bobbin and to be rotated by the rotation thereof.

3. The combination of a lifter-plate, provided with a threaded hole, a tube, externally threaded and turning in said hole and provided with a flange, a friction-plate supported on said flange and adapted to support a bobbin and to be rotated by the rotation thereof, a friction-cup, having a central screw-threaded hole to engage the thread on said tube and a suitable pad, arranged in said cup below said friction-plate.

4. The combination of a tube, provided with a flange, an annular friction-plate, supported on said flange and having a downward extension which reaches below said flange, and locking means secured to said extension below said flange to retain said friction-plate on said flange.

5. The combination of a tube, provided with a flange, having an annular groove in its upper surface, antifriction-rolls, arranged in said groove, a friction-plate surrounding said tube and resting upon said rolls and adapted to support a bobbin and to be rotated by the rotation thereof, and means of preventing said friction-plate from being lifted off from said rolls.

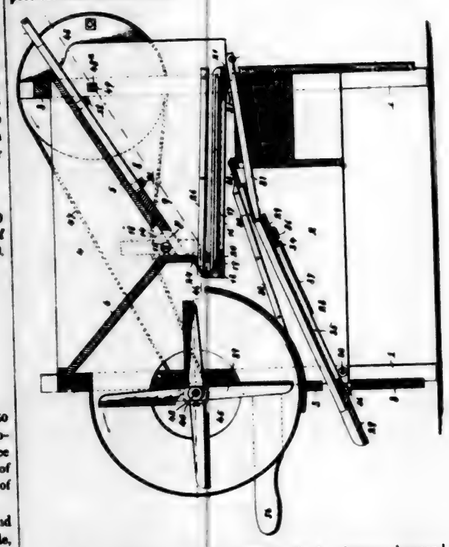
6. The combination of a tube, provided with a flange, an annular friction-plate, mediately supported on said flange and having a downward extension, externally shaped like the frustum of an inverted cone, a cup, concentric with said tube and arranged below said friction-plate and adjustable on said tube, and a pad, arranged in said cup and internally shaped to fit said extension.

705,154. GRAIN-CLEANER. HENRICH SCHNEEFELD, Canton, Kans. Filed Apr. 5, 1901. Serial No. 54,546. (No model.)

Claim.—1. In a grain-cleaner, a hopper, a cut-off for increasing or diminishing the feed-opening therein, a screen swung beneath said feed-opening, arms projecting from one end of the screen, a rocker-shaft which is engaged by the arms, a loop secured to the screen at the opposite end from the arms, and a hook adapted to engage the loop, substantially as described.

2. In a grain-cleaner, a blower, a crank-shaft upon which it is rigidly mounted, an agitator, consisting of a journaled transverse bar terminating at one end in a crank, a rocker-shaft suitably mounted, and a connecting-bar secured at one end to the rocker-shaft and adapted to be secured either to the blower-shaft or the crank of the agitator, substantially as described.

3. In a grain-cleaner, a hopper, an agitator journaled in the opposite ends of the feed-opening therein, a screen consisting of a swinging outer frame, a transverse groove in the front portion thereof, an inner frame removably fitting in the outer one, a transverse tongue extending from the front end thereof and adapted to fit into the groove in the outer frame, suitable means for securing the rear end of the inner frame to the outer one, and an inclined chute located beneath the screen, for the purpose set forth and described.



4. In a machine of the character described, a frame, a hopper located therein, a feed-opening at the bottom of the hopper, a screen suspended beneath the feed-opening, a rocker-shaft, arms projecting from the screen and engaging the rocker-shaft, another screen suspended beneath the first-mentioned one, an arm projecting therefrom and engaging the rocker-shaft, an upper apron secured to the rear of the screen, a lower apron secured in advance of the upper apron, and rollers for supporting the lower front portion of the screen, substantially as described.

5. In a grain-cleaner, a hopper, an adjustable cut-off located in the feed-opening thereof, a screen suspended beneath said feed-opening, a pair of arms projecting from the rear end of the screen and provided with notches at their outer terminals, a rocker-shaft engaged by the notched ends of the arms, and adapted to impart a swinging motion to the screen, a loop secured to the central part of the forward portion of the screen, and a depending hook adapted to engage the loop and support the forward end of the screen, substantially as described.

6. In a grain-cleaner, a hopper, a screen suspended beneath the feed-opening therein, two notched arms projecting from the rear end of the screen, a rocker-shaft engaged by the notched terminals of the shaft, and adapted to impart a swinging motion to the screen, a centrally-located loop secured to the forward portion of the screen, a depending hook which engages the loop, and a blower located at the rear end of the screen, substantially as described.

7. In a grain-cleaner, a blower-shaft having a crank formed integral with one end thereof, a depending rocker-shaft journaled at the opposite end of the machine, an arm formed integral with one end of the rocker-shaft and extending above the journal thereof, a connecting-rod for transmitting motion from the blower-shaft to the rocker-shaft, a sieve, a hook and loop for supporting the forward end thereof, and arms rigidly secured to the rear end of the sieve, and adapted to engage the rocker-shaft, substantially as described.

8. In a grain-cleaner, a hopper, an agitator journaled therein, consisting of a transverse bar, a pulley mounted on one end of said bar, a crank-arm formed integral with its opposite end, a connecting-bar adapted to be secured near its central portion to the crank-arm, a depending rocker-shaft, an arm formed integral with one end thereof and pivotally secured to one end of the connecting-bar, a sieve, a hook and loop for supporting its forward end, and arms rigidly secured to its rear end and adapted to engage the rocker-shaft, substantially as described.

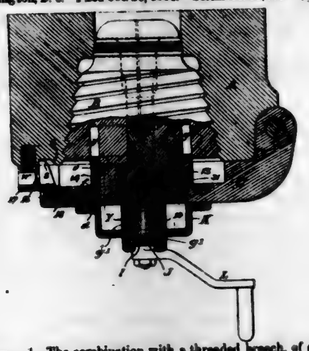
705,155. GRADING-PLOW. JOHN SOWORDS, Denver, Mo. Filed Oct. 18, 1901. Serial No. 79,108. (No model.)

Claim.—The herein-described combined plow and grader comprising a suitable beam provided with a share and moldboard and a coöperating colter, a suitable seat secured to the beam, in combination with a regulating-bar 11 provided with the adjusting-lever 12 having means to hold said lever in the desired position and an auxiliary regulating gage-runner 16 and a lever 19 coöperating therewith whereby said gage-runner may be adjusted as desired all combined substantially in the manner specified and for the purpose set forth.

705,156. ARTIFICIAL-STONE FACING. CHARLES W. STEVENS, North Harvey, Ill. Filed Jan. 17, 1901. Serial No. 43,633. (No specimens.)

Claim.—An artificial-stone facing for attachment to surfaces, comprising a substantially rectangular block having its faces bounded in the same plane throughout, and a series of anchors having their ends upset and headed, with one of the headed ends embedded in the block and the other end projecting from one of the faces thereof, the surface to which the facing is to be applied being provided with projecting anchors in staggered relation to those carried by the blocks and received between those of the blocks, the blocks being entirely out of engagement with the surface throughout, and cement interposed between the surface and the said face of the block and engaging the latter throughout said face, substantially as described.

705,157. BREECH-LOADING ORDNANCE. JOHN W. STOCKETT, Washington, D. C. Filed Oct. 20, 1900. Serial No. 33,761. (No model.)



Claim.—1. The combination with a threaded breech, of a plug-carrier, a breech-plug having a continuous thread and supported to rotate and move longitudinally on the carrier and having a peripheral spiral cam of varying depth, a radially-moving bolt on the carrier to lock the carrier to the breech and to engage said cam whereby the bolt is gradually released as the plug is rotated to withdraw it from the breech and in closing the plug is fed forward by the bolt engaging the cam before the plug-threads engage those of the breech, and means for rotating the plug on the carrier, substantially as described.

2. The combination with a threaded breech, of a plug-carrier, a threaded breech-plug supported to rotate and move longitudinally on the carrier and having a spiral cam of varying depth and a locking-recess in said cam, a bolt on the carrier to engage said cam and locking-recess, and means for moving the plug on the carrier, substantially as described.

3. The combination with a threaded breech having a bolt-tripping recess provided with a bevel *t*, of a plug-carrier, a threaded breech-plug supported to rotate and move longitudinally on the carrier and having a spiral cam and a locking-recess, a bolt on the carrier, one end of which is provided with a bevel, adapted to engage the recess in the breech, and the inner end of the bolt adapted to engage said spiral cam and recess on the plug, and means for moving the plug on the carrier, substantially as described.

4. The combination with a threaded breech, of a plug-carrier, a threaded breech-plug supported to rotate and move longitudinally on the carrier and provided with teeth and having a spiral cam formed on the said teeth, a bolt on the carrier to engage said spiral cam, and a pinion mounted on the carrier engaging the teeth on the plug and provided with an operating-handle, substantially as described.

5. The combination with a threaded breech having a bolt-recess, of a swinging plug-carrier having an opening to receive the plug, a threaded breech-plug having a spiral cam terminating in a socket and supported to rotate and move longitudinally in the opening of the carrier, a movable bolt on the carrier, a spring on the bolt to cause one end to engage the cam and socket of the plug, an inclined face on the breech to release the bolt from the socket in the plug, and means for turning the plug, substantially as described.

6. The combination with a threaded breech, of a swinging breech-plug carrier, a threaded breech-plug mounted to rotate and move longitudinally on the carrier, teeth on the plug, a pinion turning on a bearing on the carrier and engaging the teeth on the plug, a handle swinging with the carrier for operating the pinion, means for locking the breech-plug and the carrier when the plug has completed its longitudinal movement in the carrier after the plug has been disengaged from the threads of the breech and for locking the handle in a position to exert the greatest leverage to turn the carrier on its hinge, substantially as described.

7. The combination with a threaded breech, of a threaded breech-plug, a plug-carrier, means for rotating and moving the plug longitudinally in the carrier, a spindle extending through the plug about which the plug can rotate, means for preventing the spindle from rotating, and a gas-check mounted on the inner end of the spindle, substantially as described.

8. The combination with a threaded breech, of a plug-carrier, a threaded breech-plug carried thereby and provided with a cylindrical toothed projection at its rear and having a spiral cam-groove of gradually-increasing depth in the teeth of said projection, and a locking-bolt mounted on the carrier and engaging said cam-groove, substantially as described.

9. The combination with a threaded breech, of a plug-carrier, a threaded breech-plug, a spindle about which the breech-plug revolves, having a firing-opening and provided with a head having flattened sides, a slide mounted on said head, and a cap-piece mounted on the carrier and provided with an opening engaging the flattened sides of the head whereby the spindle is prevented from turning when the plug is turned, substantially as described.

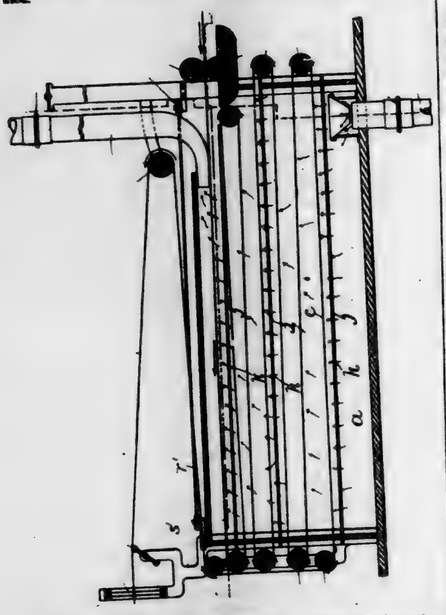
10. The combination with a threaded breech, of a plug-carrier, a threaded breech-plug, a spindle about which the breech-plug revolves having a head, a slide radially movable in said head, an ejector mounted on said head, a loose pin carried by said slide and engaging said ejector, and a cap-piece mounted on the carrier and adapted to prevent the spindle and attachments from turning while the plug is turned, substantially as described.

705,158. YARN-DRYING APPARATUS. GEORGE STONE, North Andover, Mass., assignor to M. T. Stevens and Sons, North Andover, Mass. Filed Aug. 15, 1901. Serial No. 72,168. (No model.)

Claim.—1. A yarn-drying apparatus comprising a casing, rolls located at opposite ends of the casing and arranged to conduct yarn therethrough in a sinuous course and in a series of stretches, means for forcing air under pressure into the casing at one side of the series of stretches, means for exhausting air from the casing at the opposite side of the series of stretches, and intermediate means between the stretches for distributing the air in its passage through the casing.

2. A yarn-drying apparatus comprising a casing, rolls located at

opposite ends of the casing and arranged to conduct yarn therethrough in a sinuous course and in a series of stretches, means for forcing air under pressure into the casing at one side of the series of stretches, means for exhausting air from the casing at the opposite side of the series of stretches, and fixed perforated partitions located in the casing substantially parallel with and between the said stretches, whereby the air is distributed.



3. A yarn-drying apparatus comprising a casing, rolls located at opposite ends of the casing and arranged to conduct yarn in a sinuous course and in a series of stretches through the casing, perforated partitions located in the casing and extending substantially parallel with and between stretches of yarn therein, means for forcing air under pressure into the casing at one side of the series of stretches, and means for exhausting air from the casing at the opposite side of the series of stretches.

4. A yarn-drying apparatus comprising a casing, means for conducting yarn therethrough in a sinuous course and in a series of substantially parallel stretches, means for applying sizing to the yarn at or near the locality where it enters the casing, a blast-conduit arranged to deliver air under pressure to the casing at one side of the series of stretches, the air delivered by said conduit impinging first against the stretches which are farthest from the locality where the sizing is applied, and an exhaust-conduit arranged to draw air from the casing at the opposite side of the series of stretches, the receiving end of the exhaust-conduit being adjacent to the freshly-sized stretches.

5. A yarn-drying apparatus comprising a casing, means for conducting yarn therethrough in a sinuous course and in a series of stretches, a conduit for delivering air under pressure to said casing, and means for stopping and starting the movement of the yarn through the casing and for closing and opening said conduit simultaneously with the stopping and starting of the yarn, substantially as described.

6. A yarn-drying apparatus comprising a casing, means for conducting yarn therethrough in a sinuous course and in a series of stretches, a conduit for delivering air under pressure to said casing, an exhaust-conduit for removing air from the casing, and means for stopping and starting the movement of the yarn through the casing and for closing and opening said conduits simultaneously with the stopping and starting of the yarn, substantially as described.

7. A yarn-drying apparatus comprising a casing, means for conducting yarn therethrough in a sinuous course, an air-supply or blast conduit arranged to deliver air to the casing, a valve or damper in said conduit, yarn-impelling mechanism including a driving-shaft having a fast pulley and a loose pulley and a belt adapted to run on either of said pulleys, a shipper for said belt, and connections between said shipper and damper whereby the damper and shipper may be simultaneously operated.

8. A yarn-drying apparatus comprising a casing, means for conducting yarn in a sinuous course therethrough, an air-supply or blast conduit and an exhaust-conduit each communicating with the casing and each having a valve or damper, yarn-impelling mechanism including a driving-shaft having a fast pulley and a loose pulley, and a belt adapted to run on either pulley, a shipper for said belt and connections between said shipper and the dampers of said conduits whereby said dampers and shipper are simultaneously operated.

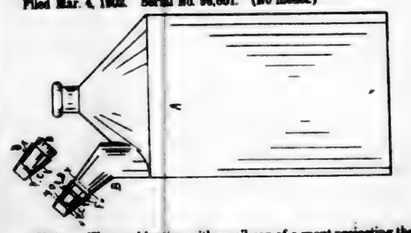
9. A yarn-drying apparatus comprising a casing, means for conducting yarn therethrough in a sinuous course, yarn-impelling mechanism including a driving-shaft having a fast pulley and a loose pulley and a belt adapted to run on either of said pulleys, a shipper for said belt, an air-supply or blast conduit arranged to deliver air to the casing, a valve or damper in said conduit, and a damper and shipper operating mechanism including an elongated flexible cord accessible at different points, and connections between said cord and the damper and shipper.

705,159. HOOK AND EYE. LUCY A. SUTHERLAND, Chicago, Ill. Filed Jan. 3, 1902. Serial No. 88,321. (No model.)

Claim.—1. An eye comprising parallel side bars joined at their front ends and formed into a loop, an intermediate bar connected to the rear end of one of said bars, said intermediate bar being parallel to and in the same plane as said side bars and bent downwardly at its front end to form an attaching-pin in a lower parallel plane, the other side bar being bent at its rear end to form a safety-catch for the end of the pin.

2. A hook comprising parallel side bars joined at their front ends and bent upwardly to form a bill, an intermediate bar connected to the rear end of one of said bars, said intermediate bar being parallel to and in the same plane as said side bars, and bent downwardly at its front end to form an attaching-pin in a lower parallel plane, the other side bar being bent at its rear end to form a safety-catch for the end of the pin.

705,160. OIL-CAN SPOUT. JOHN A. SWANSON, Auburn, Kans. Filed Mar. 4, 1902. Serial No. 96,601. (No model.)



Claim.—The combination with an oil-can of a spout projecting therefrom provided with an attached transverse semicircular disk at its outer end, a cap fitting thereover and provided with an attached semicircular disk, the periphery of said cap extending beyond said disks, the pin or stud G on the spout, and the guide-slot F in the cap, the end of said slot being slightly elevated to hold said two semicircular disks firmly together when said spout is closed.

705,161. CONNECTING-PLUG FOR ELECTRICAL SWITCH-BOARDS. ARTHUR T. M. THOMSON, East Dulwich, England. Filed Dec 18, 1899. Serial No. 740,804. (No model.)

Claim.—A connecting-plug for an electrical switchboard within the casing of which, at the end projecting from the switchboard, is provided an electric lamp, which is connected by wires, inside the plug, to the casing of the plug and to the sleeve of the plug, which sleeve is also joined to one of the communication-wires of the plug, whereby a signal-current of electricity sent through that wire and the casing of the plug will cause the lamp to be illuminated and serve the purpose of a signal.

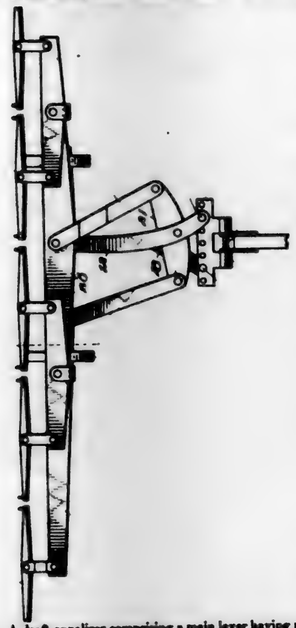
705,162. ANIMAL-POKE. CORNELIUS H. TROOIEN, Hendricks, Minn. Filed Dec. 31, 1901. Serial No. 87,923. (No model.)

Claim.—1. An animal-poke comprising a collar having a rearwardly-directed plate, a lever pivoted to the collar, a needle pivoted to the lever and passed rearwardly and downwardly through the plate, means for holding the lever yieldably with the needle retracted, and a guard connected to the lever and slidably connected with the plate, said guard extending above the needle.

2. An animal-poke comprising a collar having a rearwardly-directed portion, a bifurcated lever having its bifurcations pivoted to opposite sides of the collar, a needle pivoted to the lever and passed through the extension of the collar, a helical spring disposed upon the needle and bearing with its ends against the lever and the extension of the collar, respectively, and a guard disposed to protect the spring and needle, said guard being pivoted at one end to the lever and being slidably connected with the collar at its opposite end.

3. An animal-poke comprising a collar having a rearwardly-directed portion having a perforation therethrough and having parallel guides at opposite sides of the perforation, a lever pivoted to the collar, a needle pivoted to the lever and slidably engaged with the perforation, means for holding the needle normally retracted, and a guard attached to the lever above the needle and having its ends slidably engaged with the guides to permit of movement of the lever to project the needle through the perforation.

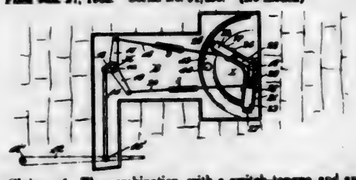
705,168. DRAFT-EQUALIZER. CORNELIUS H. TROOIEN, Hendricks, Minn. Filed Feb. 24, 1902. Serial No. 95,261. (No model.)



Claim.—1. A draft-equalizer comprising a main lever having means for hitching an animal at one end thereof, a draft-iron attached to the lever adjacent to its opposite end and having a lever pivoted thereto and extending at opposite sides thereof connections between the first lever and one end of the second lever, a doubletree connected with the opposite end of the second lever, and a link pivoted to the first-named lever and to the doubletree and extending normally longitudinally thereof.

2. A draft-equalizer comprising a main lever having a singletree connected at one end thereof, a draft-iron pivoted to the lever adjacent to the opposite end thereof and having a lever pivoted thereto and projecting at opposite sides of the iron, a link pivoted to the main lever and to one end of the second lever, a doubletree, a link pivoted to the doubletree and to the second end of the second lever, a link pivoted to the doubletree and to the end of the main lever opposite to the singletree, loops connected to and projecting laterally beyond the main lever, and cleats upon the doubletree and with which the loops are slidably engaged.

705,164. RAILWAY-SWITCH. ALEXANDER G. TURGOTTE, Holyoke, Mass., assignor to himself and Napoleon McClure, Hartford, Conn. Filed Jan. 27, 1902. Serial No. 91,439. (No model.)



Claim.—1. The combination, with a switch-tongue, and an oscillatory member connected therewith; of a horizontally-shiftable device for operating said tongue and having its impact-point longitudinally movable relatively to the track; and a spring interposed between said member and said devices.

2. The combination, with a switch-tongue, and an oscillatory member connected therewith; of a pair of horizontally-movable devices for operating said tongue and having impact-points longitudinally movable relatively to the track; and a spring interposed between said member and said devices.

3. The combination, with a switch-tongue, and an oscillatory lever connected therewith; of a box; a cover having concentric slots; a rock-lever resiliently connected with said lever and having at its opposite ends devices, the impact-points of which normally project through said slots, and are longitudinally movable relatively to the track, for shifting said oscillatory lever.

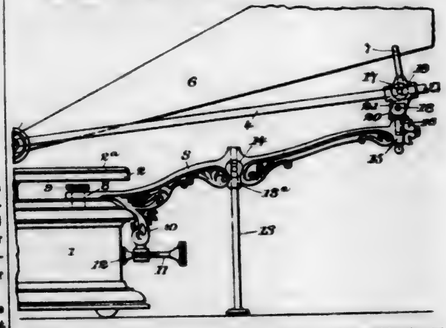
4. The combination, with a switch-tongue, and a shiftable lever for operating said tongue; of devices mounted for yielding movement in a vertical plane and having their impact-points normally project through said slots, and longitudinally movable relatively to the track; and resilient connections between said lever and said device.

5. The combination, with a switch-tongue, of a rock-lever for operating said tongue and having at its opposite ends devices for operating said rock-lever in opposite directions, respectively; and a spring engaging both of said devices, and for permitting the same to yield downwardly.

6. The combination, with a switch-tongue, and a rock-lever connected therewith and having a substantially U-shaped cross-section; of spring-actuated dogs carried in the hollow portion of said rock-lever and for moving said lever in opposite directions, respectively.

7. The combination, with a switch-tongue, and a rock-lever connected therewith and having a substantially U-shaped cross-section; of spring-actuated dogs pivoted in the hollow portion of said rock-lever and for moving said lever in opposite directions, respectively.

705,165. HORN-SUPPORTING ARM FOR TALKING-MACHINES. LOUIS P. VALLIENT, New York, N. Y., assignor to Universal Talking Machine Manufacturing Company, New York, N. Y., a Corporation of New York. Filed Mar. 19, 1902. Serial No. 98,925. (No model.)



Claim.—1. In a sound-reproducing apparatus, the combination of the motor-casing, a bracket-arm having an eye formed in its inner ex-

trunnity and a downwardly-projecting lug thereunder, fastening means passing through the eye and engaging the upper part of the motor-casing, and an adjustable extension of the before-mentioned lug adapted to engage the side of the motor-casing.

2. In a sound-reproducing apparatus, the combination of the motor-casing, a bracket-arm having an eye formed in its inner extremity and a downwardly-projecting lug thereunder, fastening means passing through the eye and engaging the upper part of the motor-casing, and an adjustable extension of the before-mentioned lug adapted to engage the side of the motor-casing, together with a depending adjustable support for said bracket-arm.

3. In a sound-reproducing apparatus adapted to operate with a swinging reproducer and horn attached thereto, the combination of a motor-casing, a bracket-arm attached thereto, and means for pivoting thereto at various points in its length reproducer-arms of different radii together with a reproducer-arm whose effective length may be varied.

4. In a sound-reproducing apparatus adapted to operate with a swinging reproducer and horn attached thereto, the combination of a motor-casing, a bracket-arm attached thereto, and means for pivoting thereto at various points in its length reproducer-arms of different radii, together with a swinging reproducer-arm having a supporting-pivot adjustable lengthwise thereof.

5. In a sound-reproducing apparatus, the combination of the rotating record-carrying table, the reproducer, horn, and swinging arm therefor, the supporting-bracket, the vertical pivot-pin journaled therein, a hinged joint between said pivot-pin and arm having a horizontal axis, the intermeshing portions of said hinged joint being so shaped that the motion of the arm in a vertical plane is checked on either side, as the center of gravity of the horn and arm reaches a predetermined distance beyond a perpendicular line drawn through the pivot.

6. In a sound-reproducing apparatus, the combination of a motor-casing, a bracket-arm, means for fastening the inner end of said bracket-arm to the upper surface of the motor-casing, and a depending lug from said bracket engaging one of the sides of the motor-casing.

7. In a sound-reproducing apparatus adapted to operate with a swinging reproducer, the combination of a sliding block adjustable on said arm, and a pivot-pin hinged to said block.

705,166. ACETYLENE-GAS GENERATOR. DAVID J. VAN PRAAG, London, England. Filed Aug. 3, 1901. Serial No. 71,396. (No model.)

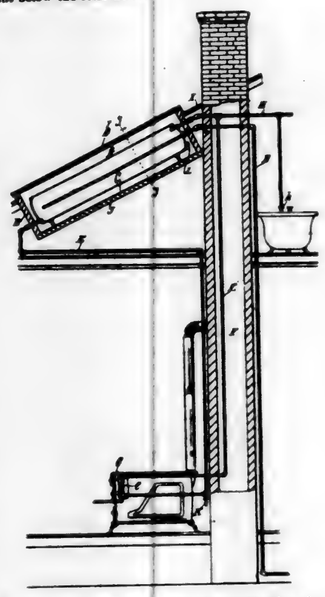
Claim.—1. The combination with the carbid-chamber and superposed water-chamber, of a plug seated in the bottom of the water-chamber, having a central passage flaring at its upper end, and a lateral port into the water-chamber, a tube extending upwardly from said plug through the water-chamber, a conical valve seated in the upper end of the plug and having a central bore and a tubular stem, said valve having a transverse passage from said bore, a glass or porcelain nipple in the lower end of the plug, and a wire plated with non-corrodible material extending through said valve and stem and through the nipple, substantially as described.

2. In an acetylene-gas apparatus, a carbid-container having a perforated top plate, means for supplying water thereto, a loose pressure-plate for supporting the carbid, and a plurality of springs supporting said plates at different points whereby all parts of the plate are forced upwardly irrespective of the distribution of the carbid upon the plate, substantially as described.

3. In an acetylene-gas apparatus, the combination with the generating-chamber and superposed water-chamber, of a valve in the bottom of said water-chamber, a cleaning-wire extending down through the valve, a removable carbid-container within the generating-chamber, and a guard depending below the lower end of said wire and serving as a stop to prevent contact of the carbid-container with said wire, substantially as described.

705,167. COMBINED SOLAR AND ARTIFICIAL HEAT WATER-HEATER. FRANK WALKER, Los Angeles, Cal. Filed Apr. 19, 1898. Serial No. 678,173. (No model.)

Claim.—1. In a water-heating apparatus, the combination of a water-receptacle; an insulating-case around such receptacle and having a transparent portion to admit the sun's rays to heat the receptacle; a circulating-pipe opening from the receptacle and extending thence outside the case, then returned upward and opening into the receptacle; and means for applying artificial heat to the return member of the circulating-pipe at a point below the solar heater.



2. In a water-heating apparatus, the combination of a water-receptacle; an insulating-case around such receptacle and having a transparent portion to admit the sun's rays to heat the receptacle, and also having a reflector arranged at the sides of said receptacle and opposite to the transparent portion to direct the heat-rays to the receptacle; a supply-pipe to discharge into the receptacle; means for drawing hot water from the system; a circulating-pipe opening from the lower part of the receptacle and extending thence outside the case, then returned upward and connected with and discharging into the upper part of the receptacle; and means for applying artificial heat to the return member of the circulating-pipe at a point below the solar heater.

3. The combination of a water-heater boiler set at an inclination and blackened upon the outside; an insulating-case inclosing the boiler and provided upon one side with a transparent portion to admit the sun's rays to heat the boiler; a supply-pipe to discharge into the lower part of the boiler; a circulating-pipe opening from the lower part of the boiler, extending thence downward and bent at a lower level and led upward and discharging into the upper part of the boiler; means for supplying artificial heat to the return member of the pipe at a lower portion thereof; and a hot-water pipe leading from the return member of the circulating-pipe near the upper part of the boiler.

4. The combination with the roof of a house, of an insulated case set aslant into the roof and having its upper side transparent; a slanting water-boiler in the case; a supply-pipe to discharge into the lower part of the boiler; a circulating-pipe opening from the lower part of the boiler, extending thence downward and bent at a lower level and led upward and bent at its upper end and discharging into the upper part of the boiler; means for applying artificial heat to the return member of the circulating-pipe at a lower portion thereof; and a hot-water pipe leading from the upper part of the boiler.

5. The combination of the roof and chimney of a house, a slanting insulated case set in the roof of the house and having its upper side transparent; a water-boiler inside the case; a smoke-flue; a supply-pipe to discharge into the lower part of the boiler; a circulating-pipe opening from the lower part of the boiler, extending thence downward outside the smoke-flue and bent at a lower level and led upward through the smoke-flue and bent at its upper end and discharging into the upper part of the boiler; a heating appliance for heating the return member of the circulating-pipe at a lower portion thereof and arranged to discharge its surplus heat into the smoke-flue; and a hot-water pipe leading from the upper part of the boiler.

6. A water-heating system comprising a liquid-receptacle; a solar heater therefor; a circulating system connected to said receptacle; and an artificial heater located below the solar heater to heat the liquid and produce a circulation thereof through said system and receptacle.

7. A water-heating system for buildings comprising a closed receptacle arranged to absorb heat from the sun's rays and insulated to prevent the escape of heat; a cold-water-supply pipe opening into the receptacle; a hot-water-discharge pipe opening from the receptacle; a circulating-pipe leading from a lower part of the receptacle and returned to an upper part of the receptacle; and an artificial heater for heating the water in the return member of the circulating-pipe at a point below the solar heater.

8. A water-heating system for buildings, comprising the water-receptacle; means for supplying cold water to the receptacle; means for drawing heated water from the receptacle; the insulating-case around the water-receptacle and provided with a transparent portion to admit the sun's rays; reflectors arranged in the case and adapted to direct the sun's rays against the receptacle; a pipe connecting the lower end of the receptacle with an artificial heater at a point below such receptacle; such artificial heater; and a pipe connecting such artificial heater with the upper end of the receptacle; all arranged substantially as described whereby a circulation of water is induced through the pipes and receptacles when heat is applied at the artificial heater.

9. A water-heating system for buildings, comprising the water-receptacle arranged to absorb heat from the sun's rays and arranged in an insulated heat-retaining case; means for furnishing a supply of cold water to the bottom of the receptacle; means for drawing off heated water from the top of the receptacle; a pipe connecting with such receptacle at its lower end and passing downward to an artificial heater; such artificial heater; a return-pipe connecting at its lower end to the artificial heater and at its upper end to the water-receptacle; and means for heating the return-pipe above the artificial heater, whereby a rapid circulation and heating of the water in the receptacle and system are induced.

10. In a water-heating system for buildings, the combination with a receptacle, means for supplying cold water to the receptacle, and means for drawing the heated water from the receptacle; of a solar heater to heat the receptacle; an artificial heater located lower than the solar heater and receptacle; and a circulating-pipe, the ends of which connect with the receptacle and the lower portion of which pipe passes through the artificial heater.

11. In a water-heating system for buildings, the combination with an inclined receptacle, means for supplying the receptacle with cold water, and means for drawing the heated water from the receptacle; of a solar heater to heat the receptacle; a circulating-pipe, the ends of which communicate with the upper and lower ends of the receptacle respectively; and an artificial heater to heat the circulating-pipe at a point lower than the receptacle.

12. In a water-heating system for buildings, the combination of a house provided with a flue and the roof provided with an opening; of a heater communicating with the flue; an insulating-case in the roof, the top of which is open to the sun's rays, an inclined heat-absorbing receptacle provided with an inlet, and a reflector within the case, said receptacle being provided with a supply-pipe and with a circulating-pipe the ends of which communicate with the opposite ends of the receptacle respectively and the intermediate portion of which passes through the artificial heater, and a portion of the pipe between the artificial heater and the upper end of the receptacle lying within the flue; means for supplying water to the receptacle; and means for drawing the heated water from the receptacle.

13. A water-heating system for buildings comprising a hot-water receptacle arranged to absorb heat from the sun's rays; a heater arranged at a point below the hot-water receptacle and connected with the lower part of such receptacle; means connecting the heater with the top portion of the hot-water receptacle whereby the cold water of the receptacle is heated by the heater below the receptacle, and when thus heated, is mingled with the water that has been heated by the sun's rays.

14. The combination of a water-boiler in a solar heater and having one end higher than the other; a supply-pipe to discharge near the bottom of the boiler; a circulating-pipe opening from the bottom of the boiler, led downward therefrom and there bent and returned upward and ending in the boiler at the top portion thereof to form both an inlet and an outlet for hot water; a discharge-pipe leading from the upper part of said return-pipe and provided with a valve; and a heater at the lower portion of the return portion of the circulating-pipe to heat the same above the return-bend.

15. In a solar heater, the combination of an insulating-case provided with a curved reflector, and a top provided with two parallel transparent sheets with air-space between them; a cylindrical water-boiler in the case with air-space between it and the reflector; an inlet-pipe opening into the boiler at the lower portion thereof; a circulating-pipe leading from the lower portion of the boiler, extending thence downward and bent and then returned and opening into the upper portion of the boiler; a heater at the lower portion of the return-pipe to heat the same; and a draw-off valve connected with the return-pipe.

16. In a water-heating apparatus, the combination of a water-circuit including a water-reservoir, said reservoir located in one side of the circuit and near the top thereof; a solar heater arranged to heat the reservoir, and an artificial heater arranged to heat the water-circuit at substantially the lowest part thereof.

17. In a water-heating apparatus, the combination of a water-circuit, a solar heater in one side of said circuit and near the top thereof, an artificial heater in the other side of the circuit and near the bottom thereof, means for introducing water to the circuit at substantially the lowest part of the solar heater, and means for withdrawing the heated water at substantially the top of the circuit.

18. A source of liquid-supply, a solar water-heater, an artificial heater located below the solar heater, and a circulating system connected with the source of liquid-supply and connecting the solar and artificial heaters, substantially as described.

19. A liquid-receptacle, a solar heater therefor, a circulating system connected to said receptacle, and an artificial heater located below the solar heater to heat the liquid and produce a circulation thereof through said system and receptacle.

705,168. PROCESS OF PURIFYING HYDROCARBON OILS. JOHN W. WARREN, Omaha, Nebr. Filed Sept. 23, 1900. Serial No. 31,423. (No specimens.)

Claim.—1. The herein-described method of clarifying hydrocarbon oils, which consists in treating the same with a solution of sugar of lead; absorbing the water and any foreign substances resulting from such latter operation by an addition of clay of Wyoming-rock-clay constitution; drawing off the distillate; treating it with sulfuric acid; neutralizing the same by an addition of said clay; drawing off the distillate; treating it with caustic potash; allowing it to stand; re-treating the distillate with said clay; and, finally, when clear, drawing off the distillate.

2. The herein-described method of clarifying hydrocarbon oils, which consists in treating the same with a solution of sugar of lead, treating the distillate with sulfuric acid; and neutralizing the acid and clarifying the distillate by an application of clay of Wyoming-rock-clay constitution.

3. The herein-described method of clarifying hydrocarbon oils, which consists in treating the oil so as to dissolve, liberate and let fall the sulfur therein; drawing off the distillate; treating the distillate with sulfuric acid; treating the distillate to neutralize the sulfuric acid; drawing off the distillate; treating the same with caustic potash; permitting the distillate and potash to stand until the distillate is clear; and finally adding clay of Wyoming-rock-clay constitution.

4. The herein-described method of treating hydrocarbon oils, which consists in subjecting the oil to the action of a solution of sugar of lead; drawing off the distillate; treating the distillate with sulfuric acid; and, finally, letting fall through the distillate powdered Wyoming rock-clay.

705,169. DRAFT-RIGGING FOR ENGINES AND CARS. EDWIN C. WARBURG, Minneapolis, Minn. Filed Sept. 21, 1901. Serial No. 76,018. (No model.)

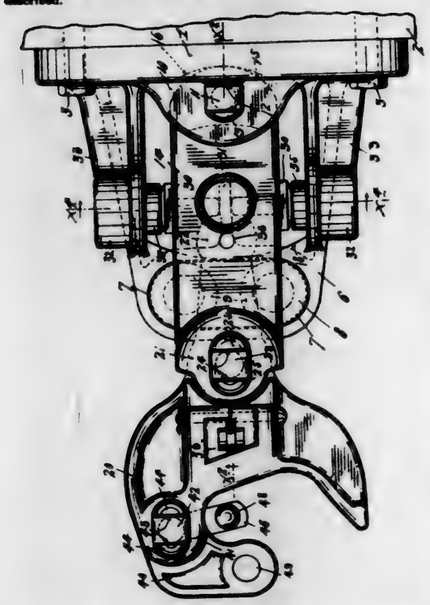
Claim.—1. The combination with a recessed draft-bar pivoted for lateral oscillations, of a coupler-head pivoted to the free end of said draft-bar, and provided with a projecting tailpiece that works in the recess of said bar, and a spring device applied to said draft-bar and to said tailpiece, said spring device working through the walls of said draft-bar and serving to yieldingly hold said draft-bar and coupler-head centered or in an intermediate normal position, substantially as described.

2. The combination with a recessed draft-bar pivoted for lateral oscillations, of a coupler-head pivoted to the free end of said draft-bar and provided with a tailpiece that works within the recess of said draft-bar, and spring devices comprising a pair of plungers or parts and springs acting thereon, which plungers work through the walls of the said draft-bar and by the coöperation therewith of said spring normally hold said draft-bar and said coupler in intermediate or centered positions, substantially as described.

3. The combination with a recessed draft-bar 14 pivoted at 11, of the coupler-head 20 formed with the lug 21 and tail extension 22, the pin 23 pivotally connecting said lug portion 21 to the free end of said draft-bar and engaging said tailpiece 22, the pair of plungers 30 working through the walls of said draft-bar, and a pair of springs, one operating on each of said plungers 30, substantially as described.

4. The combination with a bracket or support formed with the pair

of laterally-spaced spring-pockets 32, of the draft-bar 14 pivoted at 11, the coupler-head 20 pivoted to the free end of the said draft-bar and provided with the tailpiece 22, the pair of headed plungers 30 working through said draft-bar and operating on said tailpiece 22, and the spring device involving the springs 34 and caps 35, said parts 34, 35 working within said pockets 33, and operating upon said plungers 30, substantially as described.



5. The combination with a bracket or support, of a draft-bar pivoted thereto, and a coupler-head pivoted to said draft-bar, the said three parts having coincident perforations or openings, which adapt them to be locked together, substantially as described.

6. A coupler-head pivoted for lateral oscillations and provided with a rearwardly-projected tail piece or portion, in combination with a spring applied entirely at the rear of the pivot of said coupler-head to press downward on said tailpiece, to thereby hold the coupler-head upward, substantially as described.

7. The combination with a recessed draft-bar pivoted for lateral oscillations, of a coupler-head pivoted to the free end of said draft-bar and provided with a tailpiece working within the recess thereof, and a spring applied between the upper wall of said draft-bar and the free end of said tailpiece, whereby said coupler-head is yieldingly held upward, substantially as described.

8. The combination with a draft-bar pivoted for lateral oscillations, and a coupler-head with projected tailpiece pivoted to said draft-bar, of a spring device applied to yieldingly hold upward said draft-bar, and another spring device applied between said draft-bar and said tailpiece for yieldingly holding upward said coupler-head, substantially as described.

9. The combination with a coupler-head of the Master Car-Builders' type having the pivoted knuckle with pin seat or passage 49, of the safety arm or projection carried by the coupler below the same and provided with a vertical lug or projection immediately below the seat or perforation 49, of an interlocking coupler, substantially as and for the purposes set forth.

10. The combination with the coupler of the Master Car-Builders' type, involving a knuckle pivoted to the coupler-head by a pintle or bolt 42 and having the pin seat or passage 49, of a safety-arm secured to the lower end of said pintle 42 and provided with the lug or vertical projection 48 positioned substantially as and for the purposes set forth.

11. The combination with a laterally-movable draft-bar and coupler-head pivoted thereto, of centering-springs applied one on each side of said bar and head, the arrangement being such that lateral movement of said bar against the spring on one side will not cause the spring on the other side to be compressed, substantially as described.

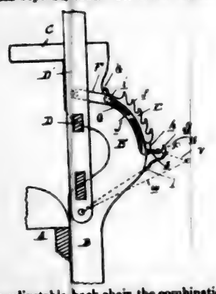
12. The combination with a laterally-movable draft-bar, of a coupler-head pivoted thereto and provided with a rearwardly-projecting tail-piece, and centering-springs acting on the opposite sides of said bar and tail of coupler-head, the arrangement being such that, under lateral movements of said bar and head, in one direction, the spring on the opposite side will not be compressed, substantially as described.

705,170. RAILROAD-RAIL JOINT. GEORGE A. WEBER, Stamford, Conn., assignor to the Weber Railway Joint Manufacturing Co., New York, N. Y., a Corporation of West Virginia. Filed Nov. 30, 1901. Serial No. 84,214. (No model.)

Claim.—1. In a railroad-rail joint the combination with rail-sections arranged in line, of a chair having a base and an upright, a fish-plate on one side, a fish-plate on the other side, a block of wood or similar compressible material fitting between the last-named fish-plate and the upright of the chair, and inclined downwardly away from the upright of the chair, and bolts for securing the parts together.

2. In a railroad-rail joint, the combination with rail-sections arranged in line, of a chair having a base and an upright, a fish-plate on one side of the rail-sections, a fish-plate or channel-bar having outwardly-extended upper and lower edges arranged on the other side of the rail-sections, a block of wood or similar compressible material fitting into the fish-plate or channel-bar last named and inclined downwardly away from the upright of the chair, and bolts for securing the parts together.

705,171. ADJUSTABLE-BACK CHAIR. JERROLD F. WALTON, Sturgis, Mich. Filed Sept. 24, 1901. Serial No. 76,536. (No model.)



Claim.—1. In an adjustable-back chair, the combination with a seat-frame and a back-frame hinged thereto, of a dog secured to said back-frame, an inclined rack having a series of teeth with which said dog is adapted to successively engage in the upward movement of said back-frame, and an upward and rearward extension of said seat-frame to which said rack is secured having a groove therein forming a return-channel for said dog for carrying it from engagement with the highest to the lowest tooth of said rack.

2. In an adjustable-back chair, the combination of a seat-frame having an upwardly and rearwardly curved extension forming a portion of the arm-rest, a back-frame hinged to said seat-frame, a segmental rack secured to said curved extension of the seat-frame, and a dog carried by said back-frame adapted to successively engage the teeth of said rack in the upward movement of said frame; said curved extension being recessed to form a return-channel for said dog from the highest to the lowest tooth.

3. In an adjustable-back chair, the combination with the seat-frame provided with the upward and rearward curved extension B' having the rabbet *j* therein, of the rack E having the series of teeth *f*, and the slots *i* and *k* at the upper and lower end thereof, the back-frame hinged to said seat-frame, and the pivotal dog V secured to said back-frame having the laterally-extending pin *p* adapted to successively engage said teeth *f* in its upward movement and to return through the slots *i* and *k* and rabbet *j*.

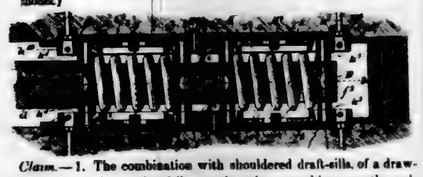
4. In an adjustable-back chair, the combination with the seat and arm-rest, of a frame comprising a rear leg secured to said seat and arm-rest and having the portion therebetween extending rearward with an inclined rear face, a rack secured in rear of and separated from said inclined face to form a channel therebetween, a back-frame hinged to said seat-frame, and a dog secured to said back-frame adapted to successively engage with the teeth of said rack in the upward movement of the back and to return through said channel.

5. In an adjustable-back chair, the combination with the seat and arm-rest, of a frame comprising a rear leg secured to said seat and arm-rest, and having the portion therebetween extending rearward and having a segmental rear face, a rack secured to said leg in rear of and separated from said segmental face and forming a channel therebetween, said rack having hooked teeth upon its outer face and being partially cut away to form slots leading respectively from its lower and upper hooks into said channel, a back-frame hinged to said seat-frame, and a pivotal dog secured to said back-frame adapted to successively engage with said hooks, in the upward movement of said back and to return through said channel.

6. In an adjustable-back chair, the combination with the seat-frame and a back-frame hinged thereto, of an upward and rearward extension of said seat-frame, an inclined rack secured to said extension and separated therefrom to form a channel therebetween, a pendent dog pivoted to said back-frame and having at its free end a lateral projection for engaging said rack, said dog being adapted to automatically successively swing into engagement with the teeth of said rack in the upward movement of the back, engaging with said channel at the upper end and to automatically swing out of said channel at the lower end thereof into engagement with the lowest tooth of said rack.

7. In an adjustable-back chair, the combination with the seat-frame and a back-frame hinged thereto, of an inclined rack secured to said seat-frame, a pendent dog secured to said back-frame adapted to successively engage with the teeth of said rack in the upward movement of said back and to return on the opposite side of said bar to the lowest tooth, said dog being adapted to swing by gravity outward into engagement with said tooth when said back is lowered slowly, and means for arresting said dog and reversing it in position so as to suspend said back when lowered quickly.

705,172. DRAFT-RIGGING FOR RAILWAY-CARS. JAMES M. WAGER, Chicago, Ill. Filed Sept. 23, 1901. Serial No. 76,533. (No model.)



Claim.—1. The combination with shouldered draft-sills, of a draw-bar, a draw-bar spring, spring follower-plates interposed between the ends of said draw-bar spring and the draw-bar, and spacing-blocks separating the follower-plates at each end of the spring.

2. The combination with shouldered draft-sills, of a draw-bar, a draw-bar spring, follower-plates interposed between the ends of the draw-bar spring and the draw-bar, spacing-blocks separating the follower-plates, and movable abutment-plates located between the ends of said follower-plates.

3. The combination with shouldered draft-sills, of a draw-bar, a draw-bar spring, two sets of spring follower-plates located one at each end of the draw-bar spring, with the middle parts of the plates of each set in engagement with the draw-bar spring and draw-bar, spacing-blocks interposed between the middle parts of the plates of each set and acting to separate the ends of the said plates, and movable abutment-plates located between the ends of the sets of follower-plates, the outermost plate or plates of each set being adapted to bear against the shoulders of the draft-sills, and the innermost plate or plates of each set being adapted for contact with said abutment-plates.

4. The combination with shouldered draft-sills, a draw-bar, two tandem draw-bar springs, spring follower-plates located between the ends of said springs and the draw-bar, and movable abutment-plates adapted to transmit pressure from one to the other of the follower-plates severally associated with each of the draw-bar springs; the abutment-plates associated with the two draw-bar springs having their ends at different distances from the ends of the follower-plates which engage the same, so that the abutment-plates will come successively into action when the springs are compressed.

5. The combination with shouldered draft-sills, a draw-bar, two tandem draw-bar springs, sets of spring follower-plates located one set at each end of each draw-bar spring, the plates of each set being separated at their ends from each other and having their middle parts in engagement with the draw-bar spring and draw-bar, and movable abutment-plates located between the ends of the sets of follower-plates belonging to each spring, the outermost plate or plates of each set being adapted to bear against the shoulder on the draft-sills, and the innermost plate or plates of each set being adapted for contact with the abutment-plates, and the abutment-plates associated with the two draw-bar springs having their ends at different distances from the ends of the innermost plates which engage the same, so that the said abutment-plates will come successively into action when the springs are compressed.

6. The combination with shouldered sills, of a draw-bar, a draw-bar spring, spring follower-plates located one between each end of said spring and the draw-bar, movable abutment-plates located between the ends of the said follower-plates and adapted for contact at their ends with said follower-plates, and shorter spring follower-plates interposed between each end of the said spring and the main longer follower-plates, said abutment-plates being provided with shoulders at a shorter distance apart than the main and contact surfaces of the abutment-plates, and which are adapted for contact with the ends of said shorter follower-plates.

7. A recessed draft-iron for tandem-spring draft-rigging provided with an integral longitudinal top flange, a detachable, longitudinal bottom flange and with flanges at its ends affording inwardly-facing bearing-shoulders, and a vertical bar applied to the draft-iron between the end flanges to afford outwardly-facing bearing-shoulders, said bar being provided with transverse notches in its ends and the top and bottom flanges having transverse ribs which interlock with the notches to hold the bar from lateral movements in both directions, horizontal rivets securing the bar to the draft-iron, and a vertical bolt inserted through the top and bottom flanges and endwise through the bar.

8. The combination with recessed draft-irons provided with longitudinal top and bottom flanges, a draw-bar yoke, tandem draw-bar springs, a block rigidly secured between the upper and lower yoke members at a point between the springs, and spring follower-plates interposed between the ends of the springs and said block, the faces of said block which are in contact with the spring follower-plates being narrower than the space between the longitudinal flanges of the draft-irons, and said blocks having integral lugs which extend laterally and outwardly therefrom so as to occupy the spaces between the side edges of one of the yoke members and the adjacent longitudinal flanges of the draft-irons, said lugs being adapted for sliding contact with said flanges.

705,173. CLOSURE FOR BOTTLES, JARS, &c. ALFRED L. WEISENTHANNER, New York, N. Y. Filed Oct. 16, 1901. Serial No. 78,870. (No model.)

Claim.—1. In a closure for receptacles, a non-resilient sheet-metal cover or cap having an integral depending practically continuous flange around its edge adapted to be bent into engagement with a shoulder or recess on the receptacle to secure the cap in place, said flange being severed or divided at one or more places, and detachable connections between the severed portions rendering the flange practically continuous.

2. In a closure for receptacles, a non-resilient sheet-metal cover or cap having an integral depending practically continuous flange around its edge adapted to be bent into engagement with a shoulder or recess on the receptacle to secure the cap in place, said flange being severed or divided at one or more places, detachable connections between the severed portions rendering the flange practically continuous and means for disengaging the flange from the shoulder on the receptacle.

3. In a closure for receptacles, a non-resilient sheet-metal cover or cap having an integral depending practically continuous flange around its edge adapted to be bent into engagement with a shoulder or recess on the receptacle to secure the cap in place, said flange being severed or divided at one or more places, detachable connections between the severed portions rendering the flange practically continuous, and means for loosening said connections.

4. In a closure for receptacles, a non-resilient sheet-metal cover or cap having an integral depending practically continuous flange around its edge adapted to be bent into engagement with a shoulder or recess on the receptacle to secure the cap in place, said flange being severed or divided at one or more places, detachable connections between the severed portions rendering the flange practically continuous, and means connected to said cap for loosening said connections.

5. In a closure for receptacles, a non-resilient sheet-metal cover or cap having an integral depending practically continuous flange around its edge adapted to be bent into engagement with a shoulder or recess on the receptacle to secure the cap in place, said flange being severed or divided at one or more places, detachable connections between the severed portions rendering the flange practically continuous, and a tongue on the cap

associated with the connections between the severed portions and whereby said connections may be loosened and the flange disengaged from the shoulder or recess on the receptacle.

6. In a closure for receptacles, a non-resilient sheet-metal cover or cap having an integral depending practically continuous flange around its edge adapted to be bent into engagement with a shoulder or recess on the receptacle to secure the cap in place, said flange being severed or divided at one or more places, detachable connections between the severed portions rendering the flange practically continuous, and a tongue integral with the cap associated with the connections between the severed portions and whereby said connections may be loosened and the flange disengaged from the shoulder or recess on the receptacle.

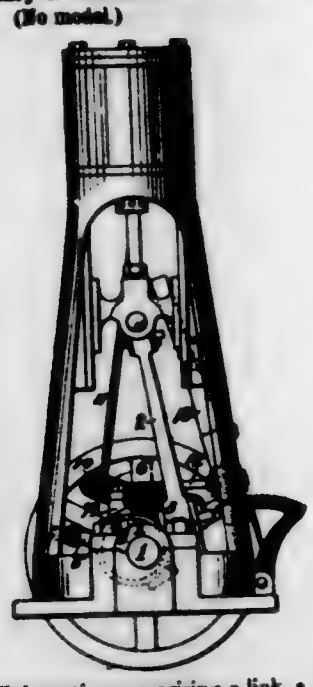
7. In a closure for receptacles, a cover or cap of non-resilient sheet metal having an integral depending flange around its edge adapted to be bent into engagement with a shoulder or recess on the receptacle to secure the cap in place, said flange being severed or divided at one point and detachable connections between the severed portions.

8. In a closure for receptacles, a cover or cap of non-resilient sheet metal having an integral depending flange around its edge adapted to be bent into engagement with a shoulder or recess on the receptacle to secure the cap in place, said flange being divided at one point and a tongue integral with the cap whereby it may be disengaged from the receptacle.

9. In a closure for receptacles, a cover or cap of non-resilient sheet metal having an integral depending flange around its edge adapted to be bent into engagement with a shoulder or recess on the receptacle to secure the cap in place, said flange being divided at a plurality of points, and a detachable connection between parts of the flange at one of said points of division.

10. In a closure for receptacles, a cover or cap of non-resilient sheet metal having an integral depending flange around its edge adapted to be bent into engagement with the shoulder or recess on the receptacle to secure the cap in place, said flange being divided at a plurality of points, a detachable connection between parts of the flange, and a tongue integral with the cap and associated with said detachable connection whereby the latter may be loosened to disengage the cap from the receptacle.

705,174. LINK-MOTION FOR STEAM-ENGINES. MARION A. WHARFIELD, Toledo, Ohio, assignor of eight-fifteenths to Benson G. McMechen and Henry C. Wharfield, Toledo, Ohio. Filed Dec. 9, 1901. Serial No. 85,165. (No model.)



Claim.—1. A link-motion comprising a link, a shaft projecting laterally from one side of the link midway between the ends of the link, stationary bearings for said shaft, connections between the shaft of the engine and the link which connections give to the link a single uniform motion on its bearings in harmony with the movement of the engine-shaft, a block in the link connected with the engine-valve, and means for controlling the position of the block relatively to the link, the arrangement being such that the block may be moved into and out of coincidence with the axis of motion of said link.

2. A link, stationary bearings on which the link rocks midway of its length and width, a cam on the engine-shaft set oppositely to the engine-crank, a cam-strap on the cam, and pivotal connections between the cam-strap and the link which pivotal connections are disposed in a line at a right angle to the line of the axes of the link-bearings and the engine-shaft.

3. In a link-movement, a link, a shaft for said link projecting from one side thereof, the arrangement being such that the shaft's axial line, extended, passes through the longitudinal and transverse center of the link-opening, a stationary bearing for said shaft, a block slidably mounted in the link, and means for rocking the link on its shaft in harmony with the motion of the engine-shaft.

4. In a link-motion, a link, a shaft for said link midway of its length, a lever connected with said shaft and having two arms at substantially a right angle to each other and in a plane parallel to the link and having at the angle of the arms an elongated opening for the engine-shaft, said link, shaft and lever being integral.

705,175. VEHICLE-TIRE. CHARLES H. WHEELER and FRANKLIN W. KREMER, Akron, Ohio; said Wheeler assignor to the India Rubber Company, Akron, Ohio, a Corporation of Ohio. Filed July 19, 1901. Serial No. 68,896. (No model.)

Claim.—1. A rubber vehicle-tire having cross-pieces embedded in the base portion thereof, each cross-piece being provided with a head at one end only, the outer surface of the head being substantially flush with the side of the rubber tire; substantially as described.

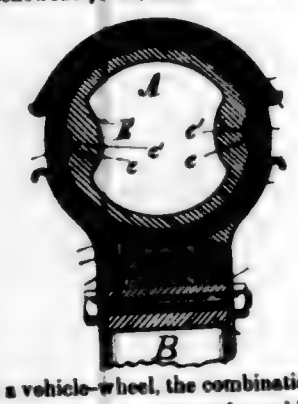
2. A rubber vehicle-tire having cross-pieces embedded in the base portion thereof, each cross-piece provided with a head at one end only, the body of the head lying within the rubber of the tire; substantially as described.

3. A rubber vehicle-tire having cross-pieces embedded in the base portion thereof, each cross-piece provided with a head oblique to its body portion and its outer surface substantially flush with the side of the rubber tire; substantially as described.

4. A rubber vehicle-tire having cross-pieces embedded in the base portion thereof, each cross-piece provided with a head at one end only, the body of the head lying within the rubber of the tire, and a circumferential binding-wire located on each side of the tire; substantially as described.

5. A vehicle-tire provided with cross-pieces, said cross-pieces being located in the base of the tire, and each provided with a head at one end only, said head being oblique to the body of the cross-piece and parallel with the side wall of the tire, and a circumferential binding-wire on each side of the tire and located within the headed portion of the cross-pieces, substantially as specified.

705,176. VEHICLE-WHEEL. CHARLES H. WHEELER and FRANKLIN W. KREMER, Akron, Ohio; said Wheeler assignor to the India Rubber Company, Akron, Ohio, a Corporation of Ohio. Original application filed May 4, 1900, Serial No. 15,445. Divided and this application filed May 20, 1901. Renewed Apr. 23, 1902. Serial No. 106,003. (No model.)



Claim.—1. In a vehicle-wheel, the combination of a rim, a tire provided with a base-piece, transverse recesses formed in said base-piece, corresponding transverse pieces engaging said recesses, a channel composed of two side members secured to the rim, each of said side members being provided with a shoulder engaging a corresponding groove formed in the tire, and transverse rods in the base-piece of the tire, the ends of said rods extending under the shoulders of the side members, substantially as specified.

2. In a vehicle-wheel, the combination of a rim, a tire provided with a base-piece, transverse recesses formed in said base-piece, corresponding transverse pieces engaging said recesses, a channel composed of two side members secured to the rim, each of said side members being provided with a shoulder engaging a corresponding groove formed in the tire, transverse rods in the base-piece of the tire, the ends of said rods extending under the shoulders of the side members, and an outside band or shoe, substantially as specified.

3. In a vehicle-wheel, the combination of a rim, a tire provided with

a base-piece, transverse recesses formed in said base-piece, corresponding lugs on the rim engaging said recesses, a channel composed of two side members secured to the rim, each of said side members being provided with a shoulder engaging a corresponding groove formed in the tire, transverse rods in the base-piece of the tire, the ends of said rods extending under the shoulders of the side members, the outer edges of the side members being turned over to form lips, substantially as specified.

4. In a vehicle-wheel, the combination of a channel, a pneumatic tire seated therein, an outside band or shoe, said pneumatic tire consisting of an air-tube having thickened side walls, and an outer envelop, and means for positively engaging the outer surface of the air-tube with the inner surface of the envelop, whereby, upon deflation, the air-tube will collapse inwardly, drawing with it the outer envelop, substantially as specified.

5. A pneumatic tire comprising an inner tube, an outer envelop cut circumferentially along the central line of the base, said outer envelop being provided with a fabric reinforcement secured to the said walls by stitching, substantially as specified.

705,177. VEHICLE-WHEEL. CHARLES H. WHEELER and FRANKLIN W. KREMER, Akron, Ohio; said Wheeler assignor to the India Rubber Company, Akron, Ohio, a Corporation of Ohio. Filed May 4, 1900. Renewed May 24, 1902. Serial No. 108,789. (No model.)

Claim.—1. In a vehicle-wheel, the combination of a rim, a tire, two side members secured to the rim, one on each side, and projecting beyond the periphery thereof to form a channel for the tire, an independent ring located in the tire above the base thereof, and transverse rods located in the tire below said ring, substantially as specified.

2. In a vehicle-wheel, the combination of a rim, a tire, two side members secured to the rim, one on each side, and projecting beyond the periphery thereof to form a channel for the tire, independent rings located in the tire above the base thereof, one on each side, and transverse rods located in the tire below said rings, substantially as specified.

3. In a vehicle-wheel, the combination of a rim, a tire, two side members secured to the rim, one on each side and projecting beyond the periphery thereof to form a channel for the tire, independent rings located in the tire above the base thereof, one on each side, transverse recesses formed in the tire and transverse pieces engaging therewith, substantially as specified.

4. In a vehicle-wheel, the combination of a rim, a tire, two side members secured to the rim, one on each side and projecting beyond the periphery thereof to form a channel for the tire, independent rings located in the tire above the base thereof, one on each side, transverse rods, the ends of which project beneath the said rings, transverse recesses formed in the base of the tire and transverse pieces engaging therewith, substantially as specified.

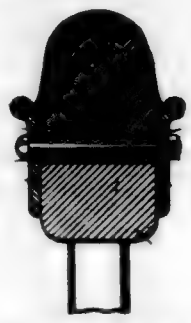
5. In a vehicle-wheel, the combination of a rim, a tire, a channel composed of two side members secured to the rim, a circumferential groove on each side of the tire, an engaging member seated in each of said grooves, and transverse rods passing through the tire and projecting beneath said engaging member, substantially as specified.

6. In a vehicle-wheel, the combination of a rim, a tire, a channel composed of two side members secured to the rim, a circumferential groove on each side of the tire, a metallic ring seated in each of said grooves, and transverse rods extending across the tire and projecting beneath said rings, substantially as specified.

7. In a vehicle-wheel, the combination of a rim, a tire, side members secured to the rim and projecting beyond the periphery thereof, one on each side, to constitute a channel, an independent ring, located in a circumferential groove in each side of the tire, transverse recesses formed in the tire and transverse pieces engaging therewith, and transverse rods, the ends of which project beneath the said engaging pieces, substantially as specified.

705,178. SOLID RUBBER TIRE. CHARLES H. WHEELER and FRANKLIN W. KREMER, Akron, Ohio; said Wheeler assignor to the India Rubber Company, Akron, Ohio, a Corporation of Ohio. Filed Oct. 23, 1900. Serial No. 34,033. (No model.)

Claim.—1. In a vehicle-wheel, a rubber tire in the form of an annulus, a rim, side flanges projecting beyond the periphery of the rim to form a tire-channel, one or more binding-rings located in the tire above the base thereof, an outer and an inner series of bolts, the outer series passing through the side flanges and the base of the tire immediately above the rim and below the binding-rings and the inner series passing through the flanges and the rim.



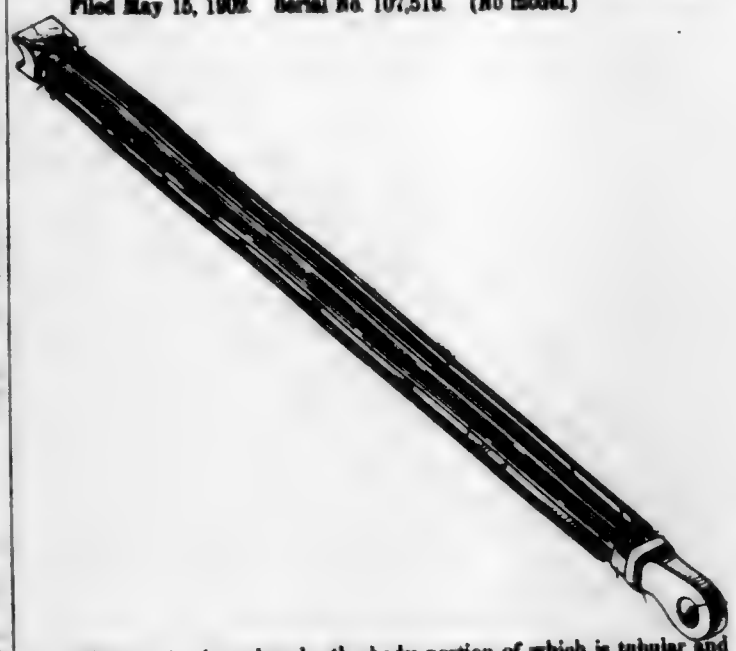
2. In a vehicle-wheel, a rubber tire in the form of an annulus, a rim, side flanges projecting beyond the periphery of the rim to form a tire-channel, binding-rings located in the tire above the base thereof, one on each side, transverse rods located in the tire below said rings, and two series of bolts, the outer series passing through the side flanges and the base of the tire immediately above the rim and below the binding-rings, and the inner series passing through the flanges and the rim, substantially as specified.

3. In a vehicle-wheel, a rubber tire in the form of an annulus, a rim, separable side flanges projecting beyond the periphery of the rim to form the tire-channel, and having divergent outer edges, and an outer and inner series of bolts, the outer series passing through the side flanges and the base of the rubber tire immediately above the rim of the wheel, and the inner series passing through the flanges and the rim, substantially as described.

4. In a vehicle-wheel, a rim, a rubber tire broader at the base than at the tread, and having sides inclined to the tread, said tire being in the form of an annulus, separable side flanges projecting beyond the rim to form the tire-channel and having divergent outer edges, and an outer and inner series of bolts, the outer series passing through the side flanges and the base of the rubber tire immediately above the rim of the wheel and the inner series passing through the flanges and the rim, substantially as described.

5. In a vehicle-wheel, a rubber tire in the form of an annulus, a rim, side flanges projecting beyond the periphery of the rim to form a tire-channel, means for binding the base of the tire down on the rim, and an outer and inner series of bolts, the outer series passing through the side flanges and the base of the rubber tire below the binding means, and the inner series passing through the flanges and the rim, substantially as described.

705,179. PUSH-POLE. HARVEY WHELER, Harrisburg, Pa. Filed May 15, 1902. Serial No. 107,519. (No model.)



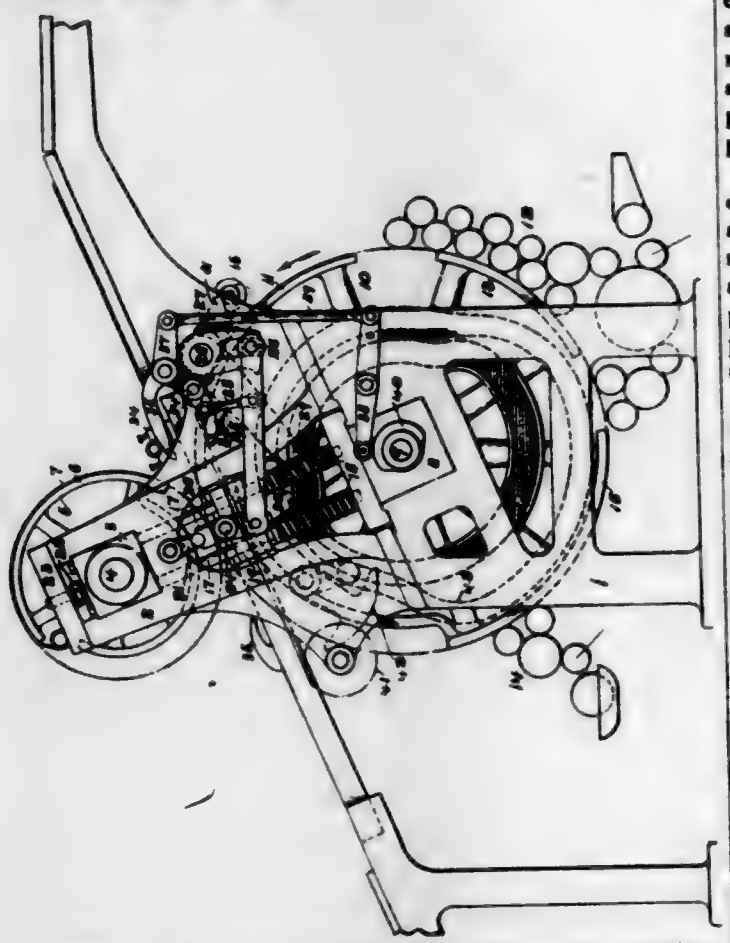
Claim.—1. A push-pole, the body portion of which is tubular and formed of a series of metal strips bolted or riveted together, and heads secured to the opposite ends of the pole, substantially as set forth.

2. A push-pole, the body portion of which is tubular and formed of a series of metal strips bolted or riveted together, heads secured at the opposite ends of the pole, and a cross-brace located within the tubular body portion and bolted or riveted in place, substantially as set forth.

3. A push-pole consisting of a tubular body portion composed of sections having flanges, a longitudinally-disposed cross-brace the edges of which project between said flanges, rivets or bolts for securing the flanges and the edges of the cross-brace in position, and heads located at the opposite ends of the pole, substantially as set forth.

4. A push-pole composed of a hollow body portion having cross-braces located therein and secured thereto, of heads having extensions formed with intersecting grooves or slots to receive the cross-braces and formed with recesses to receive the ends of the body portion, substantially as set forth.

705,180. PRINTING-MACHINE. JOSEPH WHITE, New York, N. Y., assignor to Robert Hoe, New York, N. Y. Filed Sept. 26, 1901. Serial No. 76,600. (No model.)



Claim.—1. In a printing-machine, the combination with a printing-couple comprising a member arranged to carry a transfer-surface, and a coöperating member arranged to carry a surface from which the transfer-surface receives its printing medium and an impression-surface, of means for separating the members of the couple after the surface has delivered the printing medium to the transfer-surface and before the transfer and impression surfaces come into coöperative relation, substantially as described.

2. In a printing-machine, the combination with a printing-couple comprising a member arranged to carry a transfer-surface, and a coöperating member arranged to carry a surface from which the transfer-surface receives its printing medium and an impression-surface, of means for separating the members of the couple after the surface has delivered the printing medium to the transfer-surface and before the transfer and impression surfaces come into coöperative relation, and means for controlling the amount of such separation, substantially as described.

3. In a printing-machine, the combination with a printing-couple comprising a cylinder arranged to carry a transfer-surface, and a coöperating member arranged to carry a surface from which the transfer-surface receives its printing medium and an impression-surface, of means for separating the members of the couple after the surface has delivered the printing medium to the transfer-surface and before the transfer and impression surfaces come into coöperative relation, substantially as described.

4. In a printing-machine, the combination with a printing-couple comprising a cylinder arranged to carry a transfer-surface, and a coöperating member arranged to carry a surface from which the transfer-surface receives its printing medium and an impression-surface, of means for separating the members of the couple after the surface has delivered the printing medium to the transfer-surface and before the transfer and impression surfaces come into coöperative relation, and means for controlling the amount of such separation, substantially as described.

5. In a printing-machine, the combination with a printing-couple comprising a member arranged to carry a transfer-surface, and a coöperating cylinder arranged to carry a surface from which the transfer-surface receives its printing medium and an impression-surface, of means for separating the members of the couple after the surface has delivered the printing medium to the transfer-surface and before the transfer and impression surfaces come into coöperative relation, substantially as described.

6. In a printing-machine, the combination with a printing-couple comprising a member arranged to carry a transfer-surface, and a coöperating cylinder arranged to carry a surface from which the transfer-surface receives its printing medium and an impression-surface, of means for separating the members of the couple after the surface has delivered the printing medium to the transfer-surface and before the transfer and impression surfaces come into coöperative relation, and means for controlling the amount of such separation, substantially as described.

7. In a printing-machine, the combination with a printing-couple comprising a cylinder arranged to carry a transfer-surface, and a coöperating cylinder arranged to carry a surface from which the transfer-surface receives its printing medium and an impression-surface, of means for separating the members of the couple after the surface has delivered the printing medium to the transfer-surface and before the transfer and impression surfaces come into coöperative relation, substantially as described.

8. In a printing-machine, the combination with a printing-couple comprising a cylinder arranged to carry a transfer-surface, and a coöperating cylinder arranged to carry a surface from which the transfer-surface receives its printing medium and an impression-surface, of means for separating the members of the couple after the surface has delivered the printing medium to the transfer-surface and before the transfer and impression surfaces come into coöperative relation, and means for controlling the amount of such separation, substantially as described.

9. A printing-couple comprising a member arranged to carry a printing-surface and a coöperating member carrying an ink-applying means and a planographic impression-surface, substantially as described.

10. A printing-couple comprising a cylinder arranged to carry a printing-surface and a coöperating member carrying an ink-applying means and a planographic impression-surface, substantially as described.

11. A printing-couple comprising a member arranged to carry a printing-surface and a coöperating cylinder carrying an ink-applying means and a planographic impression-surface, substantially as described.

12. A printing-couple comprising a cylinder arranged to carry a printing-surface and a coöperating cylinder carrying an ink-applying means and a planographic impression-surface, substantially as described.

13. A printing-couple comprising a member arranged to carry a flexible printing-surface and a coöperating member carrying an ink-applying means and a planographic impression-surface, substantially as described.

14. A printing-couple comprising a cylinder arranged to carry a flexible printing-surface and a coöperating member carrying an ink-applying means and a planographic impression-surface, substantially as described.

15. A printing-couple comprising a member arranged to carry a flexible printing-surface and a coöperating cylinder carrying an ink-applying means and a planographic impression-surface, substantially as described.

16. A printing-couple comprising a cylinder arranged to carry a flexible printing-surface and a coöperating cylinder carrying an ink-applying means and a planographic impression-surface, substantially as described.

17. A printing-couple comprising a member arranged to carry a flexible printing-surface and a coöperating member carrying an ink-applying means and a planographic impression-surface, and means for separating the members of the couple, substantially as described.

18. A printing-couple comprising a cylinder arranged to carry a flexible printing-surface and a coöperating member carrying an ink-applying means and a planographic impression-surface, and means for separating the members of the couple, substantially as described.

19. A printing-couple comprising a member arranged to carry a flexible printing-surface and a coöperating cylinder carrying an ink-applying means and a planographic impression-surface, and means for separating the members of the couple, substantially as described.

20. A printing-couple comprising a cylinder arranged to carry a flexible printing-surface and a coöperating cylinder carrying an ink-applying means and a planographic impression-surface, and means for separating the cylinders, substantially as described.

21. The combination with a printing-couple comprising a member carrying a printing-surface and a member carrying an ink-applying surface and a planographic impression-surface, of means for dampening the impression-surface, substantially as described.

22. The combination with a printing-couple comprising a member carrying a printing-surface and a member carrying an ink-applying surface and a planographic impression-surface, of means for dampening the impression-surface, and a wiping mechanism for removing surplus moisture from the impression-surface, substantially as described.

23. The combination with a printing-couple comprising a member carrying a printing-surface and a member carrying an ink-applying surface and a planographic impression-surface, of means for dampening the

impression-surface, a wiping mechanism for removing surplus moisture from the impression-surface, and means for manipulating the wiping mechanism so as to keep it out of contact with the ink-applying surface, substantially as described.

24. The combination with a printing-couple comprising a cylinder carrying a printing-surface and a member carrying an ink-applying surface and a planographic impression-surface, of means for dampening the impression-surface, substantially as described.

25. The combination with a printing-couple comprising a cylinder carrying a printing-surface and a member carrying an ink-applying surface and a planographic impression-surface, of means for dampening the impression-surface, and a wiping mechanism for removing surplus moisture from the impression-surface, substantially as described.

26. The combination with a printing-couple comprising a cylinder carrying a printing-surface and a member carrying an ink-applying surface and a planographic impression-surface, of means for dampening the impression-surface, a wiping mechanism for removing surplus moisture from the impression-surface, and means for manipulating the wiping mechanism so as to keep it out of contact with the ink-applying surface, substantially as described.

27. The combination with a printing-couple comprising a cylinder carrying a printing-surface and a cylinder carrying an ink-applying surface and a planographic impression-surface, of means for dampening the impression-surface, substantially as described.

28. The combination with a printing-couple comprising a cylinder carrying a printing-surface and a cylinder carrying an ink-applying surface and a planographic impression-surface, of means for dampening the impression-surface, and a wiping mechanism for removing surplus moisture from the impression-surface, substantially as described.

29. The combination with a printing-couple comprising a cylinder carrying a printing-surface and a cylinder carrying an ink-applying surface and a planographic impression-surface, of means for dampening the impression-surface, a wiping mechanism for removing surplus moisture from the impression-surface, and means for manipulating the wiping mechanism so as to keep it out of contact with the ink-applying surface, substantially as described.

30. The combination with a printing-couple comprising a member carrying a yielding printing-surface and a member carrying an ink-applying surface and a planographic impression-surface, of means for dampening the impression-surface, substantially as described.

31. The combination with a printing-couple comprising a member carrying a yielding printing-surface and a member carrying an ink-applying surface and a planographic impression-surface, of means for dampening the impression-surface, and a wiping mechanism for removing surplus moisture from the impression-surface, substantially as described.

32. The combination with a printing-couple comprising a member carrying a yielding printing-surface and a member carrying an ink-applying surface and a planographic impression-surface, of means for dampening the impression-surface, a wiping mechanism for removing surplus moisture from the impression-surface, and means for manipulating the wiping mechanism so as to keep it out of contact with the ink-applying surface, substantially as described.

33. The combination with a printing-couple comprising a member carrying a transfer printing-surface and a member carrying a planographic ink-applying surface and a planographic impression-surface, of a dampening mechanism coöperating with both planographic surfaces, substantially as described.

34. The combination with a printing-couple comprising a member carrying a transfer printing-surface and a cylinder carrying a planographic ink-applying surface and a planographic impression-surface, of a dampening mechanism coöperating with both planographic surfaces, substantially as described.

35. The combination with a printing-couple comprising a cylinder carrying a transfer printing-surface and a cylinder carrying a planographic ink-applying surface and a planographic impression-surface, of a dampening mechanism coöperating with both planographic surfaces, substantially as described.

36. The combination with a printing-couple comprising a member carrying a transfer printing-surface and a member carrying a planographic ink-applying surface and a planographic impression-surface, of a dampening mechanism coöperating with both planographic surfaces, a wiping mechanism operating to remove surplus moisture from the impression-surface, and means for manipulating the wiping mechanism so as to keep it out of contact with the planographic ink-applying surface, substantially as described.

37. The combination with a printing-couple comprising a member carrying a transfer printing-surface and a cylinder carrying a planographic ink-applying surface and a planographic impression-surface, of a dampening mechanism coöperating with both planographic surfaces, a wiping mechanism operating to remove surplus moisture from the impression-surface, and means for manipulating the wiping mechanism so as to keep it out of contact with the planographic ink-applying surface, substantially as described.

38. The combination with a printing-couple comprising a cylinder carrying a transfer printing-surface and a cylinder carrying a planographic ink-applying surface and a planographic impression-surface, of a dampening mechanism coöperating with both planographic surfaces, a wiping mechanism operating to remove surplus moisture from the impression-surface, and means for manipulating the wiping mechanism so as to keep it out of contact with the planographic ink-applying surface, substantially as described.

39. The combination with a printing-couple comprising a cylinder having a printing-surface and a cylinder carrying an ink-applying surface and a planographic impression-surface, of means for separating the cylinders after the ink-applying surface has passed the printing-surface and before the printing and impression surfaces come into coöperative relation, substantially as described.

40. The combination with a printing-couple comprising a cylinder having a yielding printing-surface and a cylinder carrying a planographic ink-applying surface and a planographic impression-surface, of means for separating the cylinders after the ink-applying surface has passed the printing-surface and before the printing and impression surfaces come into coöperative relation, and a dampening mechanism coöperating with both planographic surfaces, substantially as described.

41. The combination with a printing-couple comprising a cylinder having a yielding printing-surface and a cylinder carrying a planographic ink-applying surface and a planographic impression-surface, of means for separating the cylinders after the ink-applying surface has passed the printing-surface and before the printing and impression surfaces come into coöperative relation, a dampening mechanism coöperating with both planographic surfaces, and means for varying the amount of separation between the cylinders, substantially as described.

42. The combination with a printing-couple comprising a cylinder having a yielding printing-surface and a cylinder carrying a planographic ink-applying surface and a planographic impression-surface, of means for separating the cylinders after the ink-applying surface has passed the printing-surface and before the printing and impression surfaces come into coöperative relation, a dampening mechanism coöperating with both planographic surfaces, a wiping mechanism, and means for manipulating the wiping mechanism so as to cause it to run in contact with the impression-surface and out of contact with the ink-applying surface, substantially as described.

43. The combination with a printing-couple comprising a cylinder having a yielding printing-surface and a cylinder carrying a planographic ink-applying surface and a planographic impression-surface, of means for separating the cylinders after the ink-applying surface has passed the printing-surface and before the printing and impression surfaces come into coöperative relation, a dampening mechanism coöperating with both planographic surfaces, a wiping mechanism, means for manipulating the wiping mechanism so as to cause it to run in contact with the impression-surface and out of contact with the ink-applying surface, and means for varying the amount of separation between the cylinders, substantially as described.

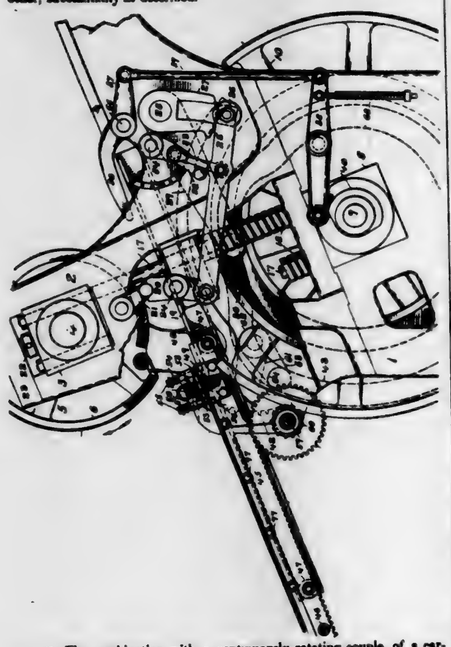
44. The combination with a printing-couple comprising a cylinder carrying a printing-surface and a cylinder carrying an ink-applying surface and a planographic impression-surface, means for dampening the impression-surface, means for separating the cylinders after the ink-applying surface has passed the printing-surface and before the printing-surface and planographic impression-surface have come into coöperative relation, and a wiping mechanism controlled by the separating means whereby said mechanism is caused to run in contact with the impression-surface and out of contact with the ink-applying surface, substantially as described.

45. The combination with a printing-couple comprising a cylinder carrying a transfer printing-surface and a cylinder carrying a planographic ink-applying surface and a planographic impression-surface, of a dampening mechanism coöperating with both planographic surfaces, means including a toggle mechanism for separating the cylinders after the ink-applying surface has passed the printing-surface and before the printing-surface and planographic impression-surface have come into coöperative relation, means for varying the amount of separation between the cylinders, and a wiping-roller connected with and operated by said separating means, whereby said roller is caused to run in contact with the impression-surface and out of contact with the ink-applying surface, substantially as described.

705,181. FEEDING MECHANISM FOR PRINTING-MACHINES. JOSEPH WHITE, New York, N. Y., assignor to Robert Hoe, New York, N. Y. Filed Sept. 26, 1901. Serial No. 76,569. (No model.)

Claim.—1. The combination with a printing-couple; of a carriage, sheet-holding devices mounted thereon said devices including a bar extending across the carriage and having its operating-face substantially flat

so that a sheet may be slid into position thereon, coöperating gripping means, gripper-operating means, said means including devices for operating the grippers while the carriage is at rest, and means for giving the carriage a reciprocating movement from one side of the couple to the other, substantially as described.



2. The combination with a continuously-rotating couple, of a carriage, sheet-holding devices mounted thereon said devices including a bar extending across the carriage and having its operating-face substantially flat so that a sheet may be slid into position thereon, coöperating gripping means, gripper-operating means, said means including devices for operating the grippers while the carriage is at rest, and means for giving the carriage a reciprocating movement from one side of the couple to the other, substantially as described.

3. The combination with a printing-couple one or both members of which have portions cut away, of a carriage, sheet-holding devices mounted thereon said devices including a bar extending across the carriage and having its operating-face substantially flat so that a sheet may be slid into position thereon, coöperating gripping means, gripper-operating means, said means including devices for operating the grippers while the carriage is at rest, and means for giving the carriage a reciprocating movement from one side of the couple to the other, substantially as described.

4. The combination with a continuously-rotating printing-couple one or both members of which have portions cut away, of a carriage, sheet-holding devices mounted thereon said devices including a bar extending across the carriage and having its operating-face substantially flat so that a sheet may be slid into position thereon, coöperating gripping means, gripper-operating means, said means including devices for operating the grippers while the carriage is at rest, and means for giving the carriage a reciprocating movement from one side of the couple to the other, substantially as described.

5. In a printing-machine, the combination with a printing-couple comprising a member arranged to carry a transfer printing-surface and a coöperating member arranged to carry a surface from which the transfer-surface receives its printing medium and an impression-surface, of a carriage, sheet-holding devices mounted thereon, and means for giving the carriage a reciprocating movement from one side of the couple to the other, substantially as described.

6. In a printing-machine, the combination with a continuously-rotating printing-couple comprising a member arranged to carry a transfer printing-surface and a coöperating member arranged to carry a surface from which the transfer-surface receives its printing medium and an impression-surface, of a carriage, sheet-holding devices mounted thereon, and means for giving the carriage a reciprocating movement from one side of the couple to the other, substantially as described.

7. In a printing-machine, the combination with a printing-couple comprising a member arranged to carry a transfer printing-surface and a coöperating member arranged to carry a surface from which the transfer-surface receives its printing medium and an impression-surface, one or both members of the printing-couples having portions cut away, of a carriage, sheet-holding devices mounted thereon, and means for giving the carriage a reciprocating movement from one side of the couple to the other, substantially as described.

8. In a printing-machine, the combination with a continuously-rotating printing-couple comprising a member arranged to carry a transfer printing-surface and a coöperating member arranged to carry a surface from which the transfer-surface receives its printing medium and an impression-surface, one or both members of the printing-couples having portions cut away, of a carriage, sheet-holding devices mounted thereon, and means for giving the carriage a reciprocating movement from one side of the couple to the other, substantially as described.

9. The combination with a printing-couple, of a carriage, gripping devices mounted on the carriage, means for opening and closing the gripping devices at the sheet-taking point, means for reciprocating the carriage to cause the sheet to pass between the members of the couple, and means for stopping the carriage and opening the gripping devices before the sheet has completed its forward movement whereby the sheet is allowed to pass onward between the members of the grippers, substantially as described.

10. The combination with a printing-couple, of a carriage, gripping devices mounted on the carriage, means for opening and closing the gripping devices at the sheet-taking point, means for reciprocating the carriage to cause the sheet to pass between the members of the couple and means for stopping the carriage and opening the gripping devices before the sheet is released by the printing-couple, substantially as described.

11. The combination with a continuously-rotating printing-couple, of a carriage, gripping devices mounted on the carriage, means for opening and closing the gripping devices at the sheet-taking point, means for reciprocating the carriage to cause the sheet to pass between the members of the couple, and means for stopping the carriage and opening the gripping devices before the sheet has completed its forward movement whereby the sheet is allowed to pass onward between the members of the grippers, substantially as described.

12. The combination with a continuously-rotating printing-couple, of a carriage, gripping devices mounted on the carriage, means for opening and closing the gripping devices at the sheet-taking point, means for reciprocating the carriage to cause the sheet to pass between the members of the couple, and means for stopping the carriage and opening the gripping devices before the sheet is released by the printing-couple, substantially as described.

13. The combination with a printing-couple, of a carriage, gripping devices, and sheet-stopping devices mounted on the carriage, and means for reciprocating the carriage from one side of the couple to the other to cause the sheet to pass between the members of the couple, substantially as described.

14. The combination with a printing-couple, of a carriage, gripping devices and sheet-stopping devices mounted on the carriage, and means for reciprocating the carriage from one side of the couple to the other in a plane at an angle to the horizontal, substantially as described.

15. The combination with a printing-couple, one or both members of the couple having portions cut away, of a carriage, gripping devices and sheet-stopping devices mounted on the carriage, and means for reciprocating the carriage from one side of the couple to the other to cause the sheet to pass between the members of the couple, substantially as described.

16. The combination with a printing-couple one or both members of the couple having portions cut away, of a carriage, gripping devices and sheet-stopping devices mounted on the carriage, and means for reciprocating the carriage from one side of the couple to the other in a plane at an angle to the horizontal, substantially as described.

17. The combination with a printing-couple, of a carriage, gripping devices mounted thereon, means for reciprocating the carriage at an angle to the horizontal and from one side of the couple to the other, means for opening and closing the gripping devices at the sheet-taking point, and means for opening the gripping devices before the sheet has completed its forward movement, whereby the sheet is caused to pass onward between the members of the grippers to the delivery-point, substantially as described.

18. The combination with a printing-couple, of a carriage, gripping devices and stopping devices mounted thereon, means for reciprocating the carriage from one side of the couple to the other in a plane at an angle to the horizontal, means for opening and closing the gripping devices at the sheet-taking point, and means for opening the gripping devices before the sheet has completed its forward movement, whereby the sheet is caused to pass onward between the members of the grippers to the delivery-point, substantially as described.

19. The combination with a printing-couple one or both members of the couple having portions cut away, of a carriage, gripping devices mounted thereon, means for reciprocating the carriage at an angle to the horizontal and from one side of the couple to the other, means for opening and closing the gripping devices at the sheet-taking point, and means for opening the gripping devices before the sheet has completed its forward movement whereby the sheet is caused to pass onward between the members of the grippers to the delivery-point, substantially as described.

20. The combination with a printing-couple one or both members of the couple having portions cut away, of a carriage, gripping devices and stopping devices mounted thereon, means for reciprocating the carriage from one side of the couple to the other in a plane at an angle to the horizontal, means for opening and closing the gripping devices at the sheet-taking point, and means for opening the gripping devices before the sheet has completed its forward movement, whereby the sheet is caused to pass onward between the members of the grippers to the delivery-point, substantially as described.

21. The combination with a printing-couple, of a carriage, gripping and sheet-stopping devices mounted on the carriage, a rack connected to the carriage, a pinion in engagement therewith, a cam, and suitable connections between the cam and the pinion whereby the carriage is caused to reciprocate from one side of the couple to the other, substantially as described.

22. The combination with a printing-couple, one or both members of the couple having portions cut away, of a carriage, gripping and sheet-stopping devices mounted on the carriage, a rack connected to the carriage, a pinion in engagement therewith, a cam, and suitable connections between the cam and the pinion whereby the carriage is caused to reciprocate from one side of the couple to the other, substantially as described.

23. The combination with a printing-couple, one or both of its members having portions cut away, of a carriage, gripping and stopping devices mounted on the carriage, tracks for the carriage arranged at an angle to the horizontal, means for opening and closing the grippers at the sheet-taking point, means for reciprocating the carriage, said means operating to bring the carriage to a stop before the sheet has completed its forward movement, and means for opening the grippers to allow the sheet to pass through them, substantially as described.

24. The combination with a printing-couple, of a carriage, gripping and stopping devices mounted thereon, means for opening and closing the gripping devices at the sheet-taking point, means for reciprocating the carriage, said means being constructed to cause a dwell in the movement of the carriage at the sheet-taking point and to bring the carriage to a stop before the sheet has completed its forward movement, whereby the sheet is caused to pass between the members of the grippers, and means for opening the grippers as the carriage is stopped, substantially as described.

25. The combination with a printing-couple, of a carriage, gripping and sheet-stopping devices mounted thereon, means for reciprocating the carriage to cause the sheet to pass between the members of the couple, said means being constructed to bring the carriage to a stop at the sheet-taking point, and gripper-operating devices, substantially as described.

26. The combination with a continuously-rotating printing-couple, of a carriage, gripping and sheet-stopping devices mounted thereon, means for reciprocating the carriage to cause the sheet to pass between the members of the couple, said means being constructed to bring the carriage to a stop at the sheet-taking point, and gripper-operating devices, substantially as described.

27. The combination with a continuously-rotating printing-couple, one or both members of the couple having portions cut away, of a carriage, gripping and sheet-stopping devices mounted thereon, means for reciprocating the carriage to cause the sheet to pass between the members of the couple, said means being constructed to bring the carriage to a stop at the sheet-taking point, and gripper-operating devices, substantially as described.

28. The combination with a printing-couple, of a carriage, gripping and stopping devices mounted thereon, means for reciprocating the carriage, said means being constructed to cause a dwell in the movement of the carriage at the sheet-taking and sheet-releasing points, means including an arm for controlling the opening of the grippers at the sheet-taking point, means for moving the arm, and means including a cam for opening the grippers at the sheet-releasing point, substantially as described.

29. The combination with a printing-couple, of a carriage, gripping and sheet-stopping devices mounted thereon, means for reciprocating the carriage at an angle to the horizontal to cause the sheet to pass between the members of the couple, said means being constructed to bring the carriage to a stop at the sheet-taking point, and gripper-operating devices, substantially as described.

30. The combination with a continuously-rotating printing-couple, of a carriage, gripping and sheet-stopping devices mounted thereon, means for reciprocating the carriage at an angle to the horizontal to cause the sheet to pass between the members of the couple, said means being constructed to bring the carriage to a stop at the sheet-taking point, and gripper-operating devices, substantially as described.

31. The combination with a continuously-rotating printing-couple one or both members of the couple having portions cut away, of a carriage, gripping and sheet-stopping devices mounted thereon, means for reciprocating the carriage at an angle to the horizontal to cause the sheet to pass between the members of the couple, said means being constructed to bring the carriage to a stop at the sheet-taking point, and gripper-operating devices, substantially as described.

32. The combination with a printing-couple, of a carriage, gripping and sheet-stopping devices mounted thereon, means for reciprocating the carriage at an angle to the horizontal, said means being constructed to cause a dwell in the movement of the carriage at the sheet-taking and sheet-releasing points, means including an arm for controlling the opening of the grippers at the sheet-taking point, means for moving the arm, and means including a cam for opening the grippers at the sheet-releasing point, substantially as described.

33. The combination with a printing-couple comprising a pair of rotating cylinders, of a carriage, gripping and stopping devices mounted thereon, means for reciprocating the carriage from one side of the couple to the other, and registering means between the carriage and the printing member of the couple, substantially as described.

34. The combination with a printing-couple comprising a pair of rotating cylinders, one or both of said cylinders having portions cut away, of a carriage, gripping and stopping devices mounted thereon, means for reciprocating the carriage from one side of the couple to the other, and registering means between the carriage and the printing member of the couple, substantially as described.

35. The combination with a printing-couple comprising a pair of rotating cylinders, of means for adjusting one member of the couple with respect to the other so as to vary the space between the members of the couple, whereby it is adapted to print upon material of different thicknesses, a carriage, gripping and stopping devices mounted on the carriage, means for reciprocating the carriage from one side of the couple to the other, registering means between the carriage and one member of the couple, and means for adjusting said registering means according to the position of the members of the couple, substantially as described.

36. The combination with a printing-couple comprising a pair of rotating cylinders, one or both of said cylinders having portions cut away, of means for adjusting one member of the couple with respect to the other so as to vary the space between the members of the couple, whereby it is adapted to print upon material of different thicknesses, a carriage, gripping and stopping devices mounted on the carriage, means for reciprocating the carriage from one side of the couple to the other, registering means between the carriage and one member of the couple, and means for adjusting said registering means according to the position of the members of the couple, substantially as described.

37. The combination with a printing-couple comprising a pair of rotating cylinders, one or both of said cylinders having portions cut away, of means for adjusting the printing member of the couple with respect to the other member, whereby the couple is adapted to print upon material of different thicknesses, a carriage, gripping and stopping devices mounted on the carriage, means for reciprocating the carriage from one side of the couple to the other, a registering mechanism between the carriage and the printing member, said mechanism including a rack and segment, and means for adjusting said registering mechanism in accordance with the position of the printing member, substantially as described.

38. The combination with a printing-couple comprising a pair of rotating cylinders, one or both cylinders having portions cut away, of means for varying the distance between the cylinders whereby the couple is adapted to print on material of different thicknesses, a carriage, gripping and stopping devices mounted on the carriage, means for reciprocating the carriage from one side of the couple to the other, means including a movable arm for opening and closing the gripping devices at the sheet-taking point, means including a stationary cam for opening the gripping devices at the sheet-releasing point, said means being arranged to operate upon the gripping devices before the sheet has reached the limit of its forward travel, a registering mechanism between one of the members of the couple and the carriage, and means for adjusting said mechanism according to the position of the members of the couple, substantially as described.

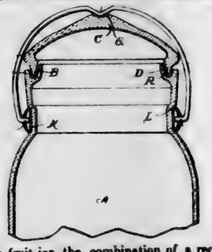
39. The combination with a printing-couple comprising a pair of rotating cylinders, one or both cylinders having portions cut away, of means for varying the distance between the cylinders whereby the couple is adapted to print on material of different thicknesses, a carriage, gripping and stopping devices mounted on the carriage, means for reciprocating the carriage from one side of the couple to the other at an angle to the horizontal, means including a movable arm for opening and closing the

gripping devices at the sheet-taking point, means including a stationary cam for opening the gripping devices at the sheet-releasing point, said means being arranged to operate upon the gripping devices before the sheet has reached the limit of its forward travel, a registering mechanism between one of the members of the couple and the carriage, and means for adjusting said mechanism according to the position of the members of the couple, substantially as described.

40. The combination with a printing-couple comprising a printing-cylinder having a transfer-surface and having a portion cut away, and a coöperating cylinder having an ink-applying surface and an impression-surface, said surfaces being spaced from each other whereby cut-away portions are provided, of a carriage, gripping and stopping devices mounted on the carriage, means for reciprocating the carriage from one side of the couple to the other, means for opening and closing the gripping devices at the sheet-taking point, means for opening the gripping devices at the sheet-releasing point, said last-named means being arranged to operate before the sheet has reached the limit of its forward movement, means for moving the printing-cylinder away from its companion cylinder after the ink has been applied thereto and before the printing and impression surfaces come into coöperative relation, means for varying the distance through which said printing-cylinder is moved, registering mechanism between the printing-cylinder and the carriage, and means for adjusting said registering mechanism according to the position of the printing-cylinder, substantially as described.

41. The combination with a printing-couple comprising a printing-cylinder having a transfer-surface and having a portion cut away, and a coöperating cylinder having an ink-applying surface and an impression-surface, said surfaces being spaced from each other whereby cut-away portions are provided, of a carriage, gripping and stopping devices mounted on the carriage, means for reciprocating the carriage from one side of the couple to the other at an angle to the horizontal, means for opening and closing the gripping devices at the sheet-taking point, means for opening the grippers at the sheet-releasing point, said last-named means being arranged to operate before the sheet has reached the limit of its forward movement, means for moving the printing-cylinder away from its companion cylinder after the ink has been applied thereto and before the printing and impression surfaces come into coöperative relation, means for varying the distance through which said printing-cylinder is moved, registering mechanism between the printing-cylinder and the carriage, and means for adjusting said registering mechanism according to the position of the printing-cylinder, substantially as described.

705,182. FRUIT-JAR. FREDERICK WIESE, Milwaukee, Wis. Filed Aug. 23, 1901. Serial No. 73,016. (No model.)

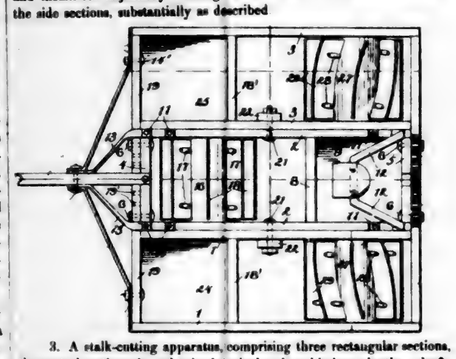


Claim.—In a fruit-jar, the combination of a receptacle having an annular trough-shaped channel surrounding the mouth thereof, adapted to receive and retain a quantity of heated wax in a liquid or semiliquid condition; a cover provided with an annular flange registering with, and adapted to rest in, said annular channel, said cover being uniformly tapered on all sides toward a crown having a central, downwardly-extending tapered socket; a spring-bow pivoted securely at the sides of the receptacle, and having a central, downwardly-extending bend, adapted to engage resiliently in the center of the cover-socket, whereby a central, downward pressure on the cover is secured, said cover being adapted to receive the bow from any direction.

705,183. STALK-CUTTER. MARK D. WILLIAMS, Sidney, Tex. Filed Oct. 15, 1901. Serial No. 78,739. (No model.)

Claim.—1. A stalk-cutter comprising three rectangular frames, adjustable means for uniting the said frames, the transverse rollers 16 and 27 journaled within the frames and provided with outwardly-extending cutter-blades, the weight-boxes 9, 24 and 25, adapted to receive weights for regulating the pressure of the cutting-blades, substantially as described.

2. A stalk-cutting machine, comprising three laterally-adjustable sections, a draft-beam carried by the middle section, a rotary cutter journaled in each section, a weight-box carried by each section, inwardly-extending cross-bars carried by the outer sections and having a series of transverse openings, bolts passing through said openings and the central section, bolts passing transversely through the side sections and the middle sections, bounds removably connected to the middle section, and their outer ends secured to the draft-beam, brace-rods bolted to the draft-beam, and means for adjustably securing the outer ends of said brace-rods to the side sections, substantially as described

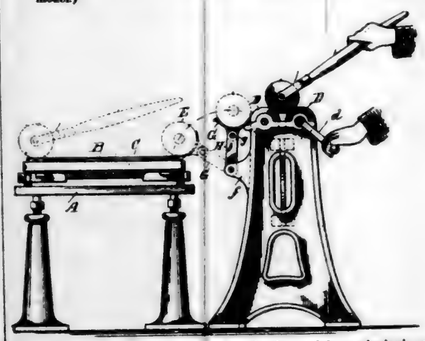


3. A stalk-cutting apparatus, comprising three rectangular sections, the central section adapted to be detached and used independently, a draft-beam adapted to be secured to either end of the central section, bounds having their outer ends secured to the draft-beam and their inner ends detachably secured to the central section, bearing-boxes secured to the under side of the three sections, rollers journaled therein, arms carried by said rollers, cutting-blades secured to the arms and extending longitudinally of the central rollers, spirally-arranged cutting-blades secured to the arms carried by the side rollers, inwardly-extending arms carried by the side sections and having a series of openings therein, bolts for securing said arms to the central section, brace-rods having their outer ends fastened to the draft-beam and their inner ends having a series of openings, and bolts passing through said openings and the side sections, and bolts passing through the side section and the central section for securing the same together, substantially as described.

4. A stalk-cutter comprising a central cutting-section, a draft-beam adapted to be secured to either end of said section, detachable side sections secured to the central section, and an adjustable connection between said side sections and the draft-beam, substantially as described.

5. A stalk-cutter comprising a central cutting-section, a draft-beam adapted to be secured to either end of said section, side sections on each side of said central sections, means for adjustably securing the side sections to or from the central section and adjustable connection between said side section and the draft-beam, substantially as described.

705,184. INKING APPARATUS. LESLIE R. WOODRUFF and FRED E. CATON, San Jose, Cal. Filed Mar. 12, 1902. Serial No. 97,806. (No model.)



Claim.—1. In an inking apparatus having an ink-supply device and an independent, manually-operated form-inking roller, deriving its ink-supply by contact with said supply device, a movable carrier adapted to travel between the ink-supply device and the type-form, and disposed to receive the form-inking roller from the supply device and to transfer it under the guidance of the operator to the type-form and back again.

2. In an inking apparatus comprising a frame, an ink-supply device carried thereby, and an independent manually-operated form-inking roller deriving its ink-supply by contact with said supply device, a carrier movably connected with said frame and disposed to receive the form-inking roller from the supply device and to transfer it under the guidance of the operator to the type-form and back again.

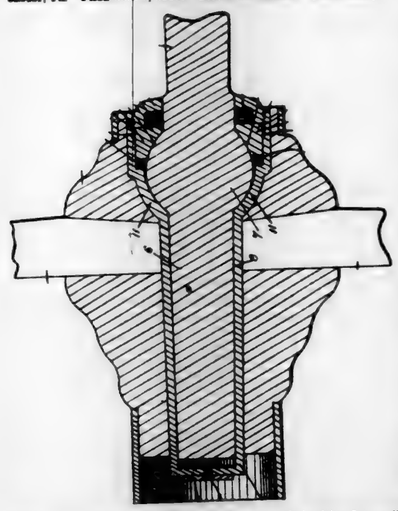
3. In an inking apparatus comprising a frame, an ink-supply device carried thereby and an independent manually-operated form-inking roller deriving its ink-supply by contact with said supply device, a carrier pivotally connected with said frame adapting it to swing between the ink-supply device and the type-form and so disposed as to receive the form-inking roller from the ink-supply device and to transfer it under the guidance of the operator to the type-form and back again.

4. An inking apparatus comprising a frame, an ink-supply device carried thereby, an independent manually-operated form-inking roller deriving its ink-supply by contact with said supply device, a carrier adapted to receive the inking-roller from the supply device and pivoted arms connecting the carrier with the frame adapting said carrier to swing between the ink-supply device and the type-form, whereby said carrier is adapted to transfer the form-inking roller, under the guidance of the operator, from the ink-supply device to the type-form and back again.

5. An inking apparatus comprising a frame, an ink-supply device carried thereby and an independent manually-operated form-inking roller deriving its ink-supply by contact with said supply device and an adjustable carrier pivotally connected with said frame adapting it to swing between the ink-supply device and the type form and so disposed as to receive the form-inking roller from the supply device and to transfer it under the guidance of the operator to the type-form and back again.

6. An inking apparatus comprising a frame, an ink-supply device carried thereby, an independent manually-operated form-inking roller deriving its ink-supply by contact with said supply device, a carrier adapted to receive the inking-roller from the supply device, pivoted arms connecting the carrier with the frame and adapting said carrier to swing between the ink-supply device and the type-form whereby said carrier is adapted to transfer the form-inking roller, under the guidance of the operator, from the ink-supply device to the type-form and back again, and a connection between the carrier and said arms whereby the carrier can be adjusted relatively thereto.

705,185. HUB-ATTACHING DEVICE. ALFRED H. WORREST, Lancaster, Pa. Filed Jan. 7, 1901. Serial No. 42,304. (No model.)



Claim.—1. In combination, an axle-box provided with a forwardly-extending concave socket having a rear opening, a spindle, a forwardly-extending convex boss on the spindle and adapted to enter said rear opening and engage the socket, and means for maintaining the boss in engagement with the socket, for the purpose specified.

2. In combination, an axle-box provided with a forwardly-extending concave socket having a rear opening as great as its own diameter, a spindle, a forwardly-extending convex boss on the spindle and adapted to engage said socket, and means for maintaining the boss in engagement with the socket, for the purpose specified

3. In combination, an axle-box provided with a forwardly-extending concave socket having a rear opening as great as its own diameter, the walls of said socket forming elliptical curves, a spindle, an elliptically-shaped-forwardly-extending convex boss on the spindle and adapted to engage said socket, and means for maintaining the boss in engagement with the socket, for the purpose specified.

4. In combination, an axle-box provided with a forwardly-extending concave socket having a rear opening as great as its own diameter, a spindle, a forwardly-extending convex boss on the spindle and adapted to engage said socket, a bearing-ring in the axle-box and engaging the rear of the boss, and means for maintaining the pressure of said ring against the boss, for the purpose specified.

5. In combination, an axle-box provided with a forwardly-extending concave socket having a rear opening as great as its own diameter, a spindle, a forwardly-extending convex boss on the spindle and adapted to engage said socket, a bearing-ring in the axle-box and engaging the rear of the boss, and a ring-nut on the axle-box, wherethrough the bearing-ring is pressed up to the boss, for the purpose specified.

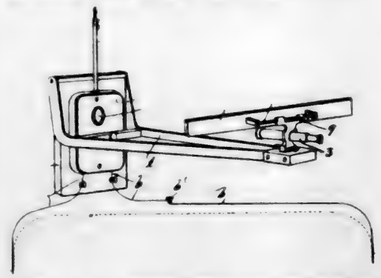
6. In combination, an axle-box provided with a forwardly-extending concave socket having a rear opening as great as its own diameter, a spindle, a forwardly-extending convex boss on the spindle and adapted to engage said socket, a bearing-ring in the axle-box and engaging the rear of the boss, a ring-nut screwed to the axle-box, and a resilient cushion between the ring-nut and the bearing-ring, for the purpose specified.

7. In combination, an axle-box provided with a forwardly-extending concave socket having a rear opening as great as its own diameter, a spindle, a forwardly-extending convex boss on the spindle and adapted to engage said socket, a bearing-ring in the axle-box and engaging the rear of the boss, a ring-nut screwed to the axle-box, and a series of springs between the ring-nut and the bearing-ring for the purpose specified.

8. In combination, an axle-box provided with a forwardly-extending concave socket having a rear opening as great as its own diameter, a spindle, a forwardly-extending convex boss on the spindle and adapted to engage said socket, a bearing-ring having a socket engaging the rear of the boss, a ring-nut screwed to the axle-box, and a resilient cushion between the ring-nut and the bearing-ring for the purpose specified.

9. In combination, an axle-box provided with a forwardly-extending concave socket having a rear opening as great as its own diameter, the walls of said socket forming elliptical curves, a spindle, an elliptically-shaped forwardly-extending convex boss on the spindle and adapted to engage said socket, a bearing-ring in a chamber behind the socket and engaging the rear of the boss, a ring-nut screwed to the axle-box, and a resilient cushion between the ring-nut and the bearing-ring, for the purpose specified.

705,186. GALVANOMETER. ANTHONY ZELENY, Minneapolis, Minn., assignor of one-half to C. E. Thayer, Minneapolis, Minn. Filed Jan. 20, 1902. Serial No. 90,401. (No model.)



Claim.—1. The combination with a thermo-electric couple, of a galvanometer having a reading-scale graduated in degrees of temperature and set, when the circuit is open, so as to indicate the temperature of the "known-temperature junction," whereby, when the circuit is closed, the temperature of the opposing junction will be directly indicated, in degrees, on said scale.

2. The combination with a thermo-electric couple, of a galvanometer having a reading-scale and an indicator, one of which is adjustable with respect to the other, and which scale is graduated in degrees of temperature and, by said adjustment, is adapted to be set, when the circuit is open, to indicate the temperature of the "known-temperature junction," whereby, when the circuit is closed, the temperature of the opposing junction will be directly indicated, in degrees, on said scale.

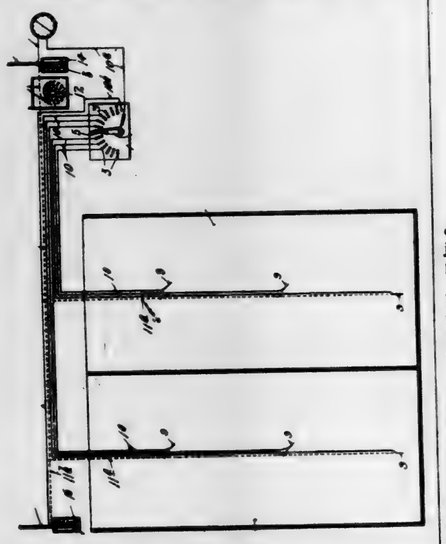
3. The combination with a thermo-electric couple, of a galvanometer having a reading-scale variably graduated, each division thereof being equal to the deflection produced when the temperatures of the two op-

posing junctions are, respectively, those indicated by the numbers at the bounding-lines of that particular division, or by the numbers that said bounding-lines represent.

4. The combination with a thermo-electric couple, of a galvanometer having a reading-scale graduated in degrees of temperature, each division thereof being equal to the deflection produced when the temperatures of the two opposing junctions are, respectively, those indicated by the numbers at the bounding-lines of that particular division, or by the numbers that said bounding-lines represent.

5. The combination with a thermo-electric couple, of a galvanometer having a reading-scale variably graduated in degrees of temperature, each division thereof being equal to the deflection produced when the temperatures of the two opposing junctions are, respectively, those indicated by the numbers at the bounding-lines of that particular division, or by the numbers that said bounding-lines represent, whereby the said scale being set, when the circuit is open, to indicate the temperature of the "known-temperature junction," the temperature of the opposing junction will be directly indicated, in degrees, on said scale, when the circuit is closed.

705,187. **MULTIPLEX ELECTRIC THERMOMETER.** ANTHONY ZELENY, Minneapolis, Minn., assignor of one-half to C. E. Thayer, Minneapolis, Minn. Filed Jan. 20, 1902. Serial No. 90,402. (No model.)



Claim.—1. The combination with a galvanometer and a switch, of a plurality of thermo-electric circuits having individual thermo-electric junctions and a common thermo-electric junction, which common junction, by said switch, may be connected with any opposing individual junction, to complete the thermo-electric circuit, substantially as described.

2. The combination with a plurality of thermo-electric couples having a common lead of a different metal than that of the individual leads, of a common galvanometer and a switch for closing any couple into circuit with said galvanometer, substantially as described.

3. The combination with a switch and a galvanometer, of a plurality of thermo-electric circuits having individual thermo-electric junctions and a common thermo-electric junction, which common junction is in one of the leads to said galvanometer and, by said switch, is adapted to be connected with any opposing individual junction, to complete the thermo-electric circuit, substantially as described.

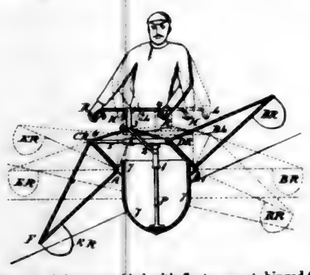
4. The combination with a galvanometer and a switch, of a plurality of thermo-electric circuits having a common return-lead and provided with individual thermo-electric junctions and a common thermo-electric junction, which common junction, by said switch, may be connected with any opposing individual junction, to complete the thermo-electric circuit, substantially as described.

5. The combination with a galvanometer and a switch, of a plurality of thermo-electric circuits having individual thermo-electric junctions, a common thermo-electric junction, and a resistance coil or device in one of the leads to said common junction, which common junction, by said switch, may be connected with any opposing individual junction, to complete the thermo-electric circuit, substantially as described.

6. The combination with a galvanometer and a switch, of a plurality of thermo-electric circuits of different length and resistance, having individual thermo-electric junctions, a common thermo-electric junction and a common low-temperature-coefficient resistance-wire, which common junction, by said switch, may be connected with any opposing individual junction, to complete the thermo-electric circuit, substantially as described.

7. The combination with a plurality of thermo-electric circuits and a switch, of a common branch of high resistance including a galvanometer, which common branch, by said switch, is capable of being connected into any one of the thermo-electric circuits, whereby said circuits, when successively closed, have practically equal resistance enabling equal differences in temperature to produce, in the said various circuits, equal deflections on the common galvanometer, substantially as described.

705,188. **ANTICAPSIZING DEVICE FOR BOATS.** FREDERICK W. EINER, London, England. Filed Dec. 27, 1897. Renewal Feb. 15, 1902. Serial No. 94,311. (No model.)



Claim.—1. A boat provided with float-supports hinged to the sides of same, a float carried by each of said supports, and a connecting-rod joining the float-support on one side of boat with the corresponding support on opposite side of boat, substantially as described.

2. In a non-capsizable boat, a float carried by a supporting-frame hinged to one side of the boat, a similar float carried by a frame hinged to the opposite side of the boat, a rod or bar connecting the two float-supporting frames, said rod or bar so constructed that it may be shortened or lengthened at will, substantially as described.

3. In a boat of the kind described, frames carrying floats, hinged connections between said frames and the sides of the boat, an adjustable connection between the frames on one side of boat and the corresponding frame on the opposite side of boat, a handle-bar suitably connected with each of the float-supporting frames, a suitable support attached to the boat and carrying a revolving collar, and a connection between said revolving collar and handle-bar, substantially as shown and described.

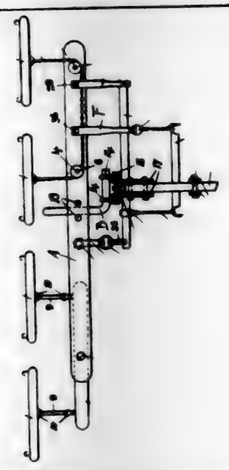
4. A boat provided with anticapsizing devices hinged to its sides and a connecting rod or bar between these anticapsizing devices, such rod or bar being so connected to the said devices that when one of said devices is moved upward the other will be forced downward, and vice versa, substantially as described.

5. A boat provided with anticapsizing devices hinged or movably attached to the sides of same and so connected with each other that the rising of the float on one side of the boat will lower the float on the other side, and vice versa, substantially as described.

705,189. **FOUR-HORSE EQUALIZER.** OSWALD ZOELLER and FREDERICK ZOELLER, Oakland, Iowa. Filed Jan. 21, 1902. Serial No. 90,646. (No model.)

Claim.—A four-horse equalizer comprising the combination of the following instrumentalities to wit, a main bar, a doubletree secured to said tree, singletrees secured to said doubletree, palleys secured to said main tree, a chain passing over said palleys, singletrees secured to the ends of said chain, an intermediate lever, links securing said intermediate lever to said main tree, guiding-pins secured to said main tree, a slidable collar upon said intermediate lever, a chain extending to said intermediate lever, a lever, said chain being secured to said lever, a chain connection extending from the remaining end of said lever and secured to said main tree, a vertical clamping-bar adapted to be secured to a plow-beam, said lever being secured to said vertical bar, an angle-iron one end passing between said guiding-pins, the remaining end passing through suitable holders adapted to be secured to the clevis of a suitable plow-beam and a push-bar extending from said vertical bar and secured to said holders securing said angle-iron, all arranged substantially as and for the purpose set forth.

705,189.



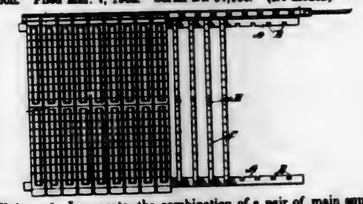
705,190. **COMBINED BADGE AND BOUQUET-HOLDING BUTTON.** GEORGE J. ALEXANDER, Philadelphia, Pa. Filed May 20, 1902. Serial No. 108,181. (No model.)

Claim.—1. A combined badge and bouquet-holding button, comprising a shank provided with an opening for the reception of a flower-stem and two heads connected with the shank, substantially as described.

2. A combined badge and bouquet-holding button, comprising a shank oblong in cross-section to properly hold it in a buttonhole, and provided with an opening for the reception of a flower-stem, and having two heads connected with the shank, whereof one is radially notched in continuation of the bore of said opening to accommodate the flower-stem, substantially as described.

3. A combined badge and bouquet-holding button, comprising a shank oblong in cross-section to properly hold it in a buttonhole, and provided with an inclined opening for the reception of a flower-stem and for properly positioning the flower, and two heads connected with the shank, whereof one is radially notched in continuation of the bore of said opening to accommodate the flower-stem, substantially as described.

705,191. **FURNACE-GRATE.** ALEXANDER G. ANDREW, Calumet, Mich. Filed Mar. 7, 1902. Serial No. 97,106. (No model.)



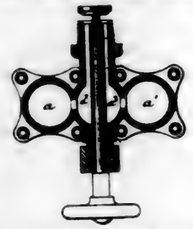
Claim.—1. In a grate, the combination of a pair of main supporting members; a series of cross-bars carried by said supporting members; a rocking bar carried by each of said cross-bars, the upper faces of the cross-bars and rocking bars lying in substantially the same horizontal plane; and means for actuating said rocking bars.

2. In a grate, the combination of a pair of main supporting members; a series of cross-bars interlocked with said supporting members; a series of rocking bars straddling said stationary cross-bars, the upper faces of the fixed and the rocking bars lying in substantially the same plane; and means for actuating said rocking bars.

3. In a grate, the combination of a pair of main supporting members; a series of cross-bars interlocked with said members; a series of rocking bars straddling said stationary bars and resting thereon at each end and at a point intermediate the end supports, the upper faces of said fixed and rocking bars lying in substantially the same plane; and means for rocking said rocking bars.

4. In a grate, the combination of a pair of main supporting members; a series of cross-bars interlocked with said members, said bars having reduced ends which extend over and bear upon said supporting members, each of said bars likewise having a seat or depression formed in its upper face; a series of rocking bars supported by said cross-bars, each rocking bar comprising two parallel members provided with a connecting member intermediate their ends, which member rests in the seat or depression formed in the upper face of the corresponding cross-bar, and with a bearing-plate J at each end which rests directly on the upper edges of the ends of the cross-bar; and means for actuating said rocking bars.

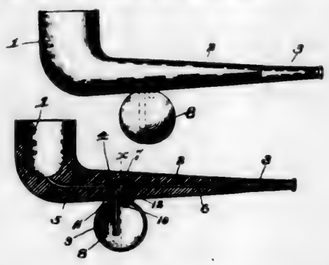
705,192. **WATER-GAGE.** FRANK M. ASHLEY, Brooklyn, N. Y. Filed Apr. 20, 1899. Serial No. 713,812. (No model.)



Claim.—1. In a double gage a fitting provided with a single pipe leading to the boiler and having two independent passages through it communicating respectively with the two gage-glasses, in combination with a single valve adapted to close automatically when a gage-glass breaks, and shut off the steam from both glasses and having a stem bearing in the partition separating the passages.

2. In a double gage a fitting provided with a single pipe leading to the boiler and having two independent passages through it communicating respectively with the two gage-glasses, in combination with a valve adapted to close automatically when a gage-glass breaks, and shut off the steam from both glasses, said valve being located at the inner end of said pipe, and having a stem bearing in the partition separating the passages, substantially as described.

705,198. **TOBACCO-PIPE.** HENRY L. AUSTWICK, Chicago, Ill. Filed Jan. 27, 1902. Serial No. 91,396. (No model.)



Claim.—1. A pipe having a stem provided upon its under side with a hole extending into the stem past the bore thereof, in combination with a water-holding reservoir 8 having a head rigidly secured to its upper end, said head being provided with bores and with pipe-sections 9 and 10, said bores being designed to be brought by the rotation of said head into or out of registration with the bore of the pipe-stem, all substantially as specified and for the purpose set forth.

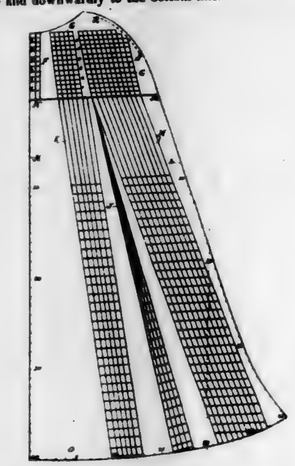
2. A pipe having a stem provided upon one side with a valve-seat extending through the bore of the stem, in combination with a reservoir having a valve upon one end adapted to fit said seat and rotate therein as set forth.

705,194. **DRESS-CHART.** MARY L. AVERY, Oakland, Cal., assignor to Mabel Crowell, Oakland, Cal. Filed Oct. 12, 1901. Serial No. 78,416. (No model.)

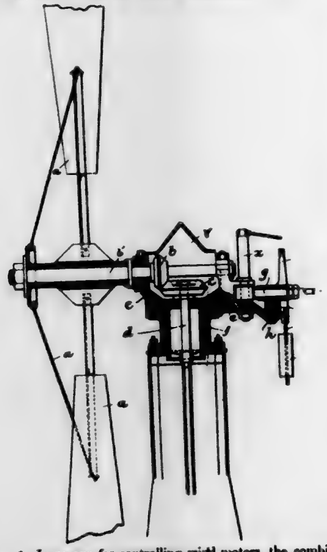
Claim.—1. In a system for drafting skirts, a chart having a graduated hip-line as a basis, and scales extending upward therefrom to the waist-line and downward therefrom to the bottom.

2. In a system for drafting skirts, a chart having a basic hip-line having a scale to indicate the points of the longitudinal seams, and related

scales beginning at the hip-line and extending from each points upwardly to the waist-line and downwardly to the bottom line.



705,195. WIND-MOTOR. CHARLES F. BAMFORD, Bedford, England. Filed Sept. 18, 1901. Serial No. 75,591. (No model.)



Claim.—1. In means for controlling wind-motors, the combination of a bevel-pinion fast to the wind-wheel spindle, of a bevel-wheel secured to the vertical driving-shaft and engaged by said wind-wheel pinion, so that the latter drives or can travel around said bevel-wheel, of a toothed extension from a rotatable bracket supporting said wind-wheel spindle, of a pinion mounted upon the vane-spindle so as to be revolvable around said vane-spindle and said pinion having a weighted lever-arm rising and falling at all times perpendicularly to the vane-spindle, substantially as described.

2. In means for controlling wind-motors, the combination with the vane-spindle and with a toothed extension from the rotatable bracket to which the vane-spindle is movably pivoted of a pinion mounted revolubly upon said vane-spindle and having a weighted lever-arm, and of a second arm projected from the pivot of said pinion and controlled by a cord, whereby the vane can be drawn around to a position at right angles to the plane of the wheel, substantially as described.

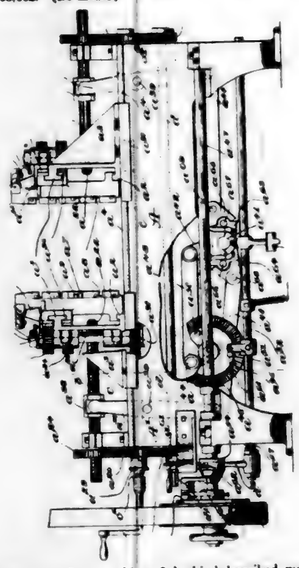
3. In wind-motors, a horizontally-rotatable bracket carrying the main spindle and provided with a toothed segment, a vane-spindle hinged to a vertical pivot on said bracket and capable of being swung horizontally, a pinion pivoted on said vane-spindle and traveling on said toothed segment, an arm fitted with a weight projecting from said pinion, a shorter arm connected by a cord with a friction-cone, and said cone being capable of being rotated frictionally with the main spindle, substantially as above described.

705,196. HANDKERCHIEF-HOLDER. NORA E. P. BERGMANN, New York, N. Y. Filed Jan. 30, 1902. Serial No. 91,902. (No model.)

Claim.—1. As a new article of manufacture, a handkerchief-holder consisting of a bracelet made of spring or resilient material bent into annular form to provide a plurality of coils or convolutions, the adjacent faces of said coils or convolutions being provided with interlocking grooves and projections in close parallel contact or spring-bearing with each other, except at the two free ends of the material from which the device is made, which ends are diverted from the adjacent coils to form open entrance-passages to the clamping-surfaces of the coils.

2. A bracelet adapted to serve as a handkerchief-holder, made of spring or resilient material bent into a plurality of coils or convolutions, said coils or convolutions being held in close contact with each other by reason of the resiliency of the material from which said bracelet is made and the adjacent or contacting surfaces of said coils being corrugated or provided with projections, which register one with another, and the end portions of the material from which the bracelet is made being bent out of contact with the adjacent coil so as to provide a jaw at each end of the bracelet.

705,197. BOX-SETTING-UP MACHINE. CHARLES W. H. BLOOD Boston, Mass., assignor to S. A. Woods Machine Company, Boston, Mass., a Corporation of Massachusetts. Filed Feb. 7, 1902. Serial No. 93,002. (No model.)



Claim.—1. In a machine of the kind described, means for supporting the boards which are to be forced together for forming a box, means for pressing said boards together, and means for automatically giving a second blow or setting squeeze.

2. In a machine of the kind described, means for supporting the boards which are to be forced together for forming a box, a yielding corner-aliner for holding adjacent boards at a corner with their inside corners or edges in substantial alinement, and squeezing means for forcing the boards together, said aliner yielding as the boards move toward each other.

3. In a machine of the kind described, means for supporting the boards which are to be forced together for forming a box, a corner-aliner constructed to engage the ends of the adjacent boards and hold said boards with their inside corners or edges in substantial alinement, squeezing means for forcing the boards together, and means for adjusting said aliner for different thicknesses of boards.

4. In a machine of the kind described, means for supporting the boards which are to be forced together for forming a box, a corner-aliner constructed to engage the ends of adjacent boards, and hold said boards with their inside corners or edges in substantial alinement, squeezing means for forcing the boards together, and means for adjusting said aliners vertically.

5. In a machine of the kind described, means for supporting the boards which are to be forced together for forming a box, a corner-aliner for holding adjacent boards at a corner with their inside corners or edges in substantial alinement, and squeezing means for forcing the boards together, said aliner having projections adapted to enter the spaces between the tongues of the respective boards at said corner in proper operative position.

6. In a machine of the kind described, means for squeezing the ends of the boards together to form a box, and means adjacent the meeting ends of two boards at a corner of the box for entering the recesses between the tongues of said boards for bringing the said tongues into proper operative position for being squeezed into interlocking box formation.

7. In a machine of the kind described, means for squeezing the ends of the boards together to form a box, and means adjacent the meeting ends of two boards at a corner of the box for entering the recesses between the tongues of said boards for bringing said tongues into proper operative position for being squeezed into interlocking box formation, said entering means being carried by said squeezing means and yielding relatively thereto upon operation of the squeezing means.

8. In a machine of the kind described, means for supporting the boards which are to be forced together for forming a box, corner pressers or jaws for engaging the box at each corner, supporting means on which the jaws are movable toward each other, mechanism for moving said supporting means forward, and mechanism for simultaneously moving said jaws on said supporting means toward each other.

9. In a machine of the kind described, corner pressers or jaws for engaging the box at each corner, means to move simultaneously any two adjacent jaws toward and from the other jaws, and means to move all of said jaws simultaneously toward a common center, said last-named means being operative in any position of the jaws.

10. In a machine of the kind described, four corner pressers or jaws for embracing the corner of a box, said jaws comprising a pair of front end jaws and a pair of rear end jaws, means for adjusting simultaneously the jaws of one pair toward and from those of the other, and means to move all of said jaws simultaneously toward a common center, said means being operative in any adjusted position of the jaws.

11. In a machine of the kind described, four corner pressers or jaws for embracing the corner of a box, said jaws comprising two pairs of side jaws, means to move the jaws of one pair toward and from the other, and means to move all of said jaws simultaneously toward a common center, said latter means being operative in any adjusted position of the jaws.

12. In a machine of the kind described, four corner pressers or jaws for embracing the corner of the box, adjustable supporting-ledges for supporting the box-boards at different heights with relation to said jaws, means to move any two adjacent jaws simultaneously toward and from the other jaws, and means to move all of said jaws simultaneously toward a common center, said latter means being operative in any adjusted position of the jaws.

13. In a machine of the kind described, a frame, slides supported thereon and movable toward and from each other longitudinally of the frame, a pair of corner jaws or pressers mounted on each slide, the jaws of each pair being movable toward and from each other on the slide, mechanism for moving said slides toward and from each other, and means for moving the jaws on each slide toward and from each other, means permitting the operator to move either the jaws on the slides or the slides on the frame at will, and power mechanism for automatically making both of said movements simultaneously.

14. In a machine of the kind described, four corner pressers or jaws, means for moving them in opposite pairs toward each other longitudinally of the machine, means for moving them in opposite pairs toward each other laterally of the machine in a direction at right angles to their longitudinal movement, and means permitting the operator to give them both or either of these movements at will.

15. In a machine of the kind described, four corner pressers or jaws, means for moving them in opposite pairs toward each other longitudinally of the machine, means for moving them in opposite pairs toward each other laterally of the machine in a direction at right angles to their longitudinal movement, and power mechanism for automatically effecting both of said movements simultaneously.

16. In a machine of the kind described, four corner pressers or jaws, means for moving them in opposite pairs toward each other longitudinally of the machine, means for moving them in opposite pairs toward each other laterally of the machine in a direction substantially at right angles to their longitudinal movement, hand-operated mechanism therefor, and automatic power mechanism therefor, said hand mechanism and power mechanism being capable of independent operation.

17. In a machine of the kind described, a frame, opposite pairs of jaws for holding and pressing together boards to form a box, each pair of jaws being movable longitudinally of said frame, a shaft connected to each of said pairs of jaws, said shafts being oppositely threaded, and means for simultaneously moving said shafts toward and from each other.

18. In a machine of the kind described, a frame, jaws for holding and pressing together boards to form a box, guides supporting said jaws in opposite pairs for moving together longitudinally of the machine, gearing movable with said guides for moving the jaws of the respective pairs toward and from each other laterally of the machine, opposite shafts connected respectively to said opposite pairs of jaws, means for simultaneously moving said shafts toward and from each other, rack-and-pinion mechanism automatically operated by said simultaneous movement for operating said gearing, thereby causing the jaws to move laterally at the same time they are moved longitudinally.

19. In a machine of the kind described, a frame, jaws for holding and pressing together boards to form a box, guides supporting said jaws in opposite pairs for moving together longitudinally of the machine, gearing movable with said guides for moving the jaws of the respective pairs toward and from each other laterally of the machine, opposite shafts connected respectively to said opposite pairs of jaws, means for simultaneously moving said shafts toward and from each other, worm and worm-wheel mechanism connected with said gearing, and means for rotating or holding stationary, as may be desired, the worm part of said mechanism when the longitudinal movement of said shafts takes place, whereby said worm and worm-wheel mechanism acts as a rack-and-pinion device when the worm is stationary, thereby causing lateral movement of the jaws at the same time with their longitudinal movement, and acts as a positive lock when the worm is rotated in unison with the longitudinal movement of said shafts.

20. In a machine of the kind described, a frame, jaws for holding and pressing together boards to form a box, guides supporting said jaws in opposite pairs for moving together longitudinally of the machine, gearing movable with said guides for moving the jaws of the respective pairs toward and from each other laterally of the machine, opposite shafts connected respectively to said opposite pairs of jaws, means for simultaneously moving said shafts toward and from each other, worm and worm-wheel mechanism connected with said gearing, and means for rotating said worm for the lateral adjustment of said jaws independently of their longitudinal adjustment.

21. In a machine of the kind described, a frame, jaws for holding and pressing together boards to form a box, guides supporting said jaws in opposite pairs for moving together longitudinally of the machine, gearing movable with said guides for moving the jaws of the respective pairs toward and from each other laterally of the machine, opposite threaded shafts connected respectively to said opposite pairs of jaws, means for simultaneously moving said shafts toward and from each other, worm and worm-wheel mechanism connected with said gearing, and means for rotating said threaded shafts and worm in unison or independently, as desired.

22. In a machine of the kind described, a frame having longitudinal ways, opposite slides mounted on said ways and provided with guides extending transversely of the machine, pairs of jaws mounted on said slides, automatic power mechanism for simultaneously moving said slides on said ways and said jaws on said guides, and hand mechanism for causing the same movement without disturbing said automatic power mechanism.

23. In a machine of the kind described, a frame having longitudinal ways, opposite slides mounted on said ways and provided with guides extending transversely of the machine, pairs of jaws mounted on said slides, automatic power mechanism for simultaneously moving said slides on said ways and said jaws on said guides, and hand mechanism, operating without disturbing said automatic power mechanism, for moving said slides on said ways.

24. In a machine of the kind described, a frame having longitudinal ways, opposite slides mounted on said ways and provided with guides extending transversely of the machine, pairs of jaws mounted on said slides, automatic power mechanism for simultaneously moving said slides on said ways and said jaws on said guides, and hand mechanism, operating without disturbing said automatic power mechanism, for moving said jaws on said guides.

25. In a machine of the kind described, a frame having longitudinal ways, opposite slides mounted on said ways and provided with guides extending transversely of the machine, pairs of jaws mounted on said slides, automatic power mechanism for simultaneously moving said slides on said ways and said jaws on said guides and including opposite shafts secured, respectively, to said opposite slides, opposite levers pivoted in

the frame of the machine and connected, respectively, to said opposite shafts, and a rock-shaft and crank for simultaneously operating said lever, and hand mechanism, operating without disturbing said automatic power mechanism, for moving said slides on said ways, and including threaded connections between said opposite levers and said shafts, and means for rotating said shafts, thereby permitting longitudinal movement of said shafts relatively to said levers without moving the levers.

26. In a machine of the kind described, means for squeezing the ends of the boards together to form a box, said squeezing means including mechanism for bringing increasing squeezing pressure as the boards approach their final interlocking position, said means including pressing-levers, a rock-shaft connected thereto and provided with a crank, a second crank, and a link connecting the latter to the first crank for operating the same, said second crank being shorter than the first crank.

27. In a machine of the kind described, four corner-jaws for engaging the box at each corner, means to simultaneously adjust any two adjacent jaws toward and from the other jaws, power mechanism to move all of said jaws simultaneously toward a common center, and means for automatically stopping the jaws in closed position.

28. In a machine of the kind described, four corner-jaws for engaging the box at each corner, means to simultaneously adjust any two adjacent jaws toward and from the other jaws, power mechanism to move all of said jaws simultaneously toward a common center, and means for simultaneously stopping the jaws in open position.

29. In a machine of the kind described, four corner-jaws for engaging the box at each corner, means to simultaneously adjust any two adjacent jaws toward and from the other jaws, power mechanism to move all of said jaws simultaneously toward a common center, means for automatically stopping the jaws in either open or closed position, and manually-controlled means for determining in which position the jaws will be stopped.

30. In a machine of the kind described, means for squeezing the ends of the boards together to form a box, said means including opposite levers movable toward each other for giving squeezing pressure, a rock-shaft connected to said levers and provided with means for moving said levers toward each other when the rock-shaft is rocked in one direction, and means for giving a second movement of the levers toward each other when the rock-shaft is rocked back in the opposite direction.

31. In a machine of the kind described, means for squeezing the ends of the boards together to form a box, mechanism for automatically operating said squeezing means, said mechanism including means for giving two distinct pressure movements, the second movement bringing the squeezing means closer together than the first.

32. In a machine of the kind described, means for squeezing the ends of the boards together to form a box, said mechanism including means for giving a first pressure movement, relieving said movement momentarily, and then giving a second pressure movement, all during the continuous rotation of the machine.

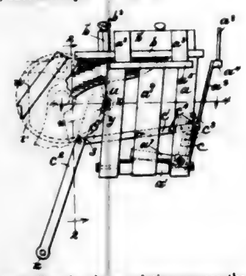
33. In a machine of the kind described, means for squeezing the ends of the boards together to form a box, said means including opposite levers movable toward each other for giving squeezing pressure, a rock-shaft joined to said levers by a double-pivoted connection, the said two pivots being located respectively above and below alinement with the rock-shaft and the pivot connection with the lever, and means permitting a limited movement only of the connection on the pivot next the rock-shaft.

34. In a machine of the kind described, means for squeezing the ends of the boards together to form a box, said means including opposite levers movable toward each other for giving squeezing pressure, a rock-shaft, a plate thereon extending rigidly in opposite directions, blocks pivoted at the free ends of said plate, said blocks being connected to said levers, and said plate and blocks having cooperating shouldered ends for giving limited pivotal movement with relation to each other, and means for swinging said blocks from one position to the other position, according to the direction of rotation of the rock-shaft.

35. In a machine of the kind described, means for squeezing the ends of the boards together to form a box, said means including opposite levers movable toward each other for giving squeezing pressure, a rock-shaft, pivotal crank-like connection between said rock-shaft and said levers for operating the latter, and means for automatically shortening and lengthening the crank movement as the rock-shaft reverses its motion after having given a first squeezing pressure.

705,198. SHEET-ALINER FOR PRINTING-PRESSES. OLIVER S. BOWMAN, Chicago, Ill. Filed May 6, 1899. Serial No. 715,782. (No model.)

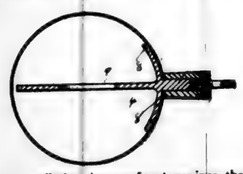
Claim.—1. In a sheet-aliner for platen printing-presses, the combination with a table upon which the sheets are delivered and having two free edges, of moving alining-fingers arranged opposite said free edges, the rocking frame c^2, and adjustable connecting means between said frame c^2 and said alining-fingers whereby the alining-fingers are moved in unison with the rocking rod d and the amounts of movement of the fingers may be varied, substantially as described.



2. In a sheet-aliner for platen printing-presses, the combination with the feeding-table b having two free edges, of the adjustable plates at the remaining edges thereof, the moving or oscillating fingers arranged opposite the free edges of said table, the rocking frame c^2, and connecting means between said rocking frame c^2 and said oscillating alining-fingers, whereby the alining-fingers are moved in unison with said rocking frame, substantially as described.

3. In a sheet-aliner for platen printing-presses, the combination with a table upon which the sheets are adapted to be delivered, said table having two free edges, of moving or oscillating fingers arranged opposite and entirely outside the said free edges, a horizontal shaft or bar for the fingers at each said edge of the table, and upon which they are supported; an arm upon one such shaft or bar engaging a like arm upon the other shaft or bar, and a connection from a movable part of the printing-press to one of said shafts or bars, to rock it, whereby both sets of alining-fingers are operated, substantially as described.

705,199. VENTILATING-DAMPER FOR STOVEPIPES. GEORGE W. BOWEN, Louisville, Ohio. Filed Feb. 13, 1902. Serial No. 93,880. (No model.)



Claim.—In a ventilating-damper for stovepipes, the combination of a stovepipe-section, provided with a bearing-aperture and ventilating-apertures, said ventilating-apertures located in a different plane from that of the bearing-aperture, a damper-plate provided with a single bearing-shank, having angular and screw-threaded portions, and lateral flanges or wings extended substantially at right angles to the damper-plate, and curved to correspond substantially with the curvature of the stovepipe-section, said bearing-shank extending through the bearing-aperture, and a knob fitting over the angular portion of the damper-shank, and means for securing said knob on said shank adapted to draw the wings and knob into frictional engagement with the pipe, substantially as set forth.

705,200. CAR-STANDARD. ENOBY O. BRADLEY and MELVIN L. BRADLEY, Tacoma, Wash. Filed Mar. 10, 1902. Serial No. 97,553. (No model.)

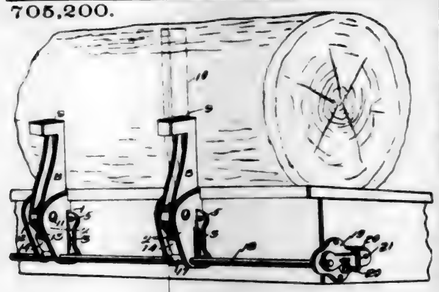
Claim.—1. In combination with a pivoted standard, a detent movable into and out of engagement therewith, to secure said standard at any desired adjustment, and means to operate said detent, substantially as described.

2. In combination with a pivoted standard, a detent movable into and out of engagement therewith, and a revoluble cam to operate said detent, substantially as described.

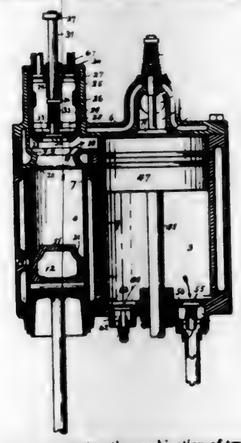
3. In combination with a pivoted standard, a detent movable into and out of engagement therewith, a revoluble cam to operate said detent, an operating-rod, connected to the cam, to turn the latter, and means to lock the operating-rod, substantially as described.

4. A car having a plurality of pivoted standards, detents movable into and out of engagement with the standards, cams to operate said detents, an operating-rod connected to the cams, and means to lock the operating-rod, substantially as described.

705,200.



705,201. GAS-ENGINE. ALEXANDER T. BROWN, Syracuse, N. Y. Filed Nov. 13, 1897. Serial No. 658,383. (No model.)



Claim.—1. In a gas-engine, the combination of two cylinders communicating with each other, two pistons connected together to traverse said cylinders, and an igniting device at substantially the end of the outward stroke of one of said pistons, a valve adapted to the head of one of said cylinders for opening and closing the passage-way between said cylinders, a supplemental valve for admitting under pressure a charge of the explosive mixture to the first cylinder when the main valve is seated, a source of fuel-supply connected to the main valve, and a compressed-air reservoir also connected to said main valve and to the second of said cylinders.

2. In a gas-engine, the combination of a pair of cylinders communicating with each other, a pair of connected pistons adapted to traverse said cylinders, a hollow valve adapted to a seat at the head of the first cylinder, a supplemental valve carried by said main valve, a source of fuel-supply discharging into said hollow valve, and a source of compressed-air supply connected to said valve and to the second cylinder, and means for igniting the charge in the first cylinder after the compressed-air charge has driven its piston outwardly.

3. In a gas-engine, the combination of two cylinders communicating with each other, a pair of pistons connected together and adapted to traverse said cylinders, an igniting device connected to one of said cylinders, a hollow valve adapted to move to and from the head of the ignition-cylinder, a fresh-air inlet arranged at the outer end of the second cylinder, a compressed-air reservoir connected to the outer end of said second cylinder, and to the said hollow valve, and means for supplying fuel to said hollow valve.

4. In a gas-engine, the combination of a pair of cylinders communicating with each other, a pair of connected pistons adapted to traverse said cylinders, an igniting device at the outer end of the stroke of the first piston, a hollow valve adapted to be forced to its seat at the head of the first cylinder by means of compressed air, a supplemental valve for admitting the charge into the first cylinder when said hollow valve is seated, a compressed-air reservoir connected to said hollow valve and to the second cylinder, and a suitable source of fuel-supply discharging into said hollow valve.

5. In a gas-engine, the combination of a pair of cylinders communicating with each other, a pair of connected pistons adapted to traverse said cylinders, an igniting device at the first cylinder, means for compressing air and delivering it to the first cylinder, and for also delivering fuel thereto, a hollow valve adapted to receive the compressed air and the fuel and to close the communication between the said two cylinders at the time of the delivery of the charge and on the outward stroke of the first piston, and means for passing the charge from the hollow valve into the first cylinder.

6. In a gas-engine, the combination of a pair of cylinders communicating with each other, a pair of pistons connected together and adapted to traverse said cylinders, an igniting device at the end of the outward stroke of the first piston, a valve-controlled inlet and a valve-controlled outlet at the outer end of the stroke of the second piston, a compressed-air reservoir connected to said second cylinder, a communication between said reservoir and the first cylinder, a valve for controlling the admission of compressed air and fuel to said cylinder, and a valve for closing the communication between the two cylinders.

7. In a gas-engine, the combination of a pair of cylinders communicating with each other, a pair of pistons connected together and adapted to traverse said cylinders, an igniting device situated at the end of the outward stroke of the first piston and entering its cylinder, a valve-controlled inlet and a valve-controlled outlet at the outer end of the stroke of the second piston, a compressed-air reservoir connected to said second cylinder, a communication between said reservoir and the first cylinder, and valves for controlling the admission of the charge and for closing the communication between said cylinders.

8. In a gas-engine, the combination of a pair of cylinders communicating with each other, a pair of connected pistons adapted to traverse said cylinders, an igniting device situated at the outer end of the stroke of the first piston and entering the cylinder thereof, a valve for controlling the passage-way between said two cylinders, and an exhaust-valve for the second cylinder.

9. In a gas-engine, the combination of two cylinders communicating with each other, a pair of pistons adapted to traverse said cylinders and connected to oppositely-disposed cranks, a valve for controlling the passage-way between said two cylinders, a supplemental or inlet valve for the first cylinder, an exhaust-valve, a fresh-air-inlet valve and a fresh-air-outlet valve for the second cylinder, a rocker-arm connected to the crank-shaft for operating the inlet or supplemental valve and also the exhaust-valve, a compressed-air reservoir connected to the first and second cylinders, a source of fuel-supply connected to discharge into the first cylinder, and a valve for controlling the supply of compressed air from the reservoir to the first cylinder.

10. In a gas-engine, the combination of a pair of cylinders communicating with each other, a pair of connected pistons adapted to traverse said cylinders, the piston of the first cylinder having a tapered or concaved portion adapted to a tapered or convex ring at the head of its cylinder, a valve-seat on said ring and a valve adapted to close the passage-way between said two cylinders adapted to said valve-seat.

11. In a gas-engine, the combination of a pair of cylinders communicating with each other, a pair of pistons connected together and adapted to traverse the same, a ring at the head of the first cylinder provided with a valve-seat and with an interior convex portion adapted to receive the circular concaved portion of the head of the piston, and a valve adapted to said seat and operating to close the passage-way between said two cylinders.

12. In a gas-engine of the character specified, the combination of a ring at the head of the first cylinder, a hollow valve adapted to seat upon said ring and close the passage-way between said two cylinders, a supplemental valve carried by said hollow valve, a compressed-air inlet to the said hollow valve, and a fuel-inlet to said valve.

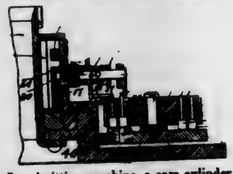
705,202. HOT-AIR REGISTER. JOHN BUCKMAN, St. Cloud, Minn. Filed Mar. 18, 1902. Serial No. 98,789. (No model.)

Claim.—1. A register consisting of a frame having a horizontal upper and lower plate having a convex edge, a series of shutters pivotally retained by said plates alongside of their convex edge, and means to partly rotate said shutters, substantially as described.

2. A register consisting of a frame, the lower plate of which has a convex edge, a series of shutters pivotally retained by said plate along-

side of its convex edge, pinions mounted upon the pivot of said shutters and a rack in engagement with said pinions, substantially as described.

705,203. KNITTING-MACHINE. DANIEL A. BOOKER, West Peabody, Mass. Filed Aug. 1, 1901. Serial No. 70,437. (No model.)



Claim.—1. In a knitting-machine, a cam-cylinder, a needle-elevating cam, an upwardly-inclined track, and a downwardly-inclined track, both of said tracks fast to said needle-elevating cam, the inner edge of said upwardly-inclined track being located nearer the center of said cam-cylinder than said downwardly-inclined track, and means to move said needle-elevating cam alternately toward and away from the center of said cam-cylinder.

2. In a knitting-machine, a needle-elevating cam, consisting of a plate having two inclined sides forming tracks converging toward one another, a lip flush with the working face of one of said tracks fast to said cam and projecting beyond the inner face of said plate, and means to move said needle-elevating cam alternately toward and away from the center of the cam-cylinder.

3. In a knitting-machine, a cam-cylinder, a needle-elevating cam, two tracks integral with said needle-elevating cam converging toward one another, the inner edge of one of said tracks being located nearer the center of said cam-cylinder than the inner edge of the other of said tracks, and means to move said needle-elevating cam alternately toward and away from the center of said cam-cylinder.

4. In a knitting-machine, a cam-cylinder, a needle-elevating cam carried by said cam-cylinder and radially movable thereon, a disk arranged to rotate around a stationary center bearing, projections upon said disk arranged to impart a radial movement to said needle-elevating cam with relation to said cam-cylinder, and mechanism to impart an intermittent rotary motion to said disk.

5. In a knitting-machine, a cam-cylinder, a needle-elevating cam carried by said cam-cylinder and radially movable thereon, a horizontal ratchet, projections upon said ratchet arranged to impart a radial movement to said needle-elevating cam with relation to said cam-cylinder, and means to raise and lower said projections with relation to the face of said ratchet and mechanism to impart an intermittent rotary motion to said ratchet.

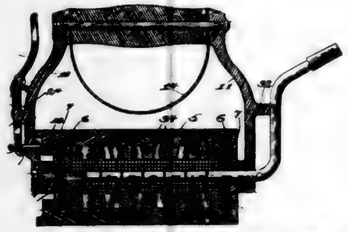
6. In a knitting-machine, a cam-cylinder, a needle-elevating cam carried by said cam-cylinder and radially movable thereon, a rotatory disk, projections upon said disk arranged to impart an outward radial movement to said needle-elevating cam, a locking device to lock said needle-elevating cam in its outward position, a spring to carry said needle-elevating cam toward the center of said cam-cylinder, and mechanism to release said locking device.

7. In a knitting-machine, a cam-cylinder, a needle-elevating cam carried by said cam-cylinder and radially movable thereon, a horizontal ratchet, mechanism to impart an intermittent rotary motion to said ratchet, projections upon said ratchet arranged to impart an outward radial movement to said needle-elevating cam with relation to said cam-cylinder, means to raise and lower said projections with relation to the face of said ratchet, a locking device to lock said needle-elevating cam in its outward position, a spring to carry said needle-elevating cam toward the center of said cam-cylinder, and projections upon said ratchet to release said locking device.

8. In a knitting-machine, a cam-cylinder, an auxiliary needle-elevating cam carried by said cam-cylinder and movable radially thereon, a stitch-cam movable vertically of said cam-cylinder, and mechanism connecting said auxiliary and stitch cams, whereby when said auxiliary cam is moved radially away from the center of said cam-cylinder, said stitch-cam will be moved vertically downwardly thereon and vice versa.

705,204. SELF-HEATING SAD-IRON. WILLIAM G. BURNS, Boston, Mass., assignor to Boston Gas Iron Mfg. Co., Boston, Mass., a Corporation of Maine. Filed June 10, 1901. Serial No. 63,870. (No model.)

Claim.—1. In a sad-iron, an ironing-body comprising two sections, each having a smoothing-surface, an inwardly-disposed flange at each end of each section, the flanges at either end of the body overlapping, a handle having hangers provided with pivot portions, said pivot portions being integral with the hangers and passing through the overlapping flanges, to unite the two sections together and to support the ironing-body for turning movement.



2. In a sad-iron, an ironing-body comprising two sections each having a smoothing-surface, an inwardly-disposed flange at each end of each section, the flanges on one section abutting at their inside edges the inside of the body of the other section, a handle having hangers, each hanger having integral therewith a pivot-bearing which extends through the adjacent overlapping flanges, said pivot-bearings serving to unite the two sections of the body and support the same for turning movement.

3. In a self-heating sad-iron, an ironing-body comprising two sections, each having a smoothing-surface, an inwardly-disposed flange at each end of each section, the flanges at each end of the body having overlapping portions, a handle having hangers each hanger having integral therewith a pivot-bearing which passes through the adjacent overlapping flanges, the said pivot-bearings operating to unite the two sections together and support the body for turning movement, and a burner projecting through one of said journals and extending lengthwise of the iron between the sections thereof, the end of said burner being supported by the other of said pivot-bearings.

4. In a self-heating sad-iron, an ironing-body comprising two sections, each having a smoothing-surface, an inwardly-disposed flange at each end of each section, the flanges at each end of the body overlapping each other throughout their entire extent, a handle including hangers having integral therewith pivot-bearings which pass through the overlapping flanges, the said pivot-bearings operating to unite the two sections and support the body for turning movement, and a burner projecting through one of said pivot-bearings and extending lengthwise of the iron between the sections thereof, the end of the burner being secured to the other of said pivot-bearings and the said burner having a portion projecting beyond the iron, one of said hangers having an arm shaped to form a seat to receive the projecting portion of the burner.

5. In a self-heating sad-iron, an ironing-body comprising two sections, each having a smoothing-surface and an inwardly-disposed flange at each end thereof, the flanges at each end of the body overlapping, a handle having hangers provided with pivot portions, said pivot portions being integral with the hangers and passing through the overlapping flanges, combined with a detachable burner located between the said sections.

6. In a self-heating sad-iron, an ironing-body having a plurality of smoothing-faces, a handle having hangers each provided with a pivot-bearing integral therewith, said pivot-bearings projecting through the ends of the iron-body and supporting the same for turning movement, a detachable burner-tube extending centrally through one of the pivot-bearings and lengthwise of the iron-body, means to adjustably connect the end of said burner-tube to the other pivot-bearing, that portion of the tube outside the iron-body being bent and engaging the outside of the adjacent hanger, whereby the burner-tube operates to tie together the lower ends of the hangers.

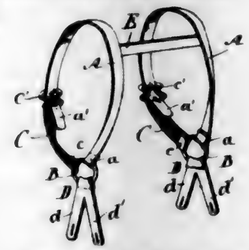
7. In a self-heating sad-iron, an ironing-body having a plurality of smoothing-faces, a handle having hangers provided with pivot-bearings, said pivot-bearings projecting through the ends of the iron-body and supporting the same for turning movement, a burner-tube extending centrally through one of the pivot-bearings and lengthwise of the iron-body, a screw passing through the other pivot-bearing and into the end of the burner-tube, that portion of the tube outside the iron-body being bent and engaging the outside of the adjacent hanger, whereby the burner-tube operates to tie together the lower ends of the hangers.

8. In a self-heating sad-iron, an ironing-body comprising two sections, each having a smoothing-face, an inwardly-disposed flange at each end of each section, the flanges at each end of the body having overlapping portions, a handle having hangers, said hangers having rigid therewith bearings which pass through the overlapping portions of said flanges, a removable burner-tube passing through one of said bearings and entering between the sections of the iron-body, a device carried by one of the hangers for holding the burner-tube normally in position, and a latch carried by the other hanger and engaging one section of the iron-body to normally hold the said body fixed with relation to said hangers.

9. In a self-heating sad-iron, an ironing-body having a plurality of smoothing-faces, a handle having hangers provided with pivot-bearings, said pivot-bearings projecting through the ends of the iron-body and supporting the same for turning movement, a burner-tube extending centrally through one of the pivot-bearings and lengthwise of the iron-body, the end of said burner being supported in an axial socket in the other pivot-bearing, a screw passing axially through the last-named pivot-bearing and into the end of the burner-tube, and adjustably securing the end of the burner-tube to said bearing, that portion of the tube outside the iron-body being bent and engaging the outside of the adjacent hanger, whereby the burner-tube operates to adjustably tie together the lower ends of the hangers.

10. In a self-heating sad-iron, a hollow ironing-body having a plurality of smoothing-faces, a handle having hangers adapted to support the ironing-body for turning movement, a burner-tube extending lengthwise of said ironing-body and passing through the lower end of one of said hangers, said burner-tube being detachably supported by said hanger and projecting outside thereof, said projecting end being constructed to have a gas-pipe connected thereto, and a screw passing through the other hanger and into the adjacent end of the burner-tube, said screw serving to rigidly tie the tube to the hanger, combined with means to lock the ironing-body in either of its adjusted positions.

705,205. SUSPENDERS. JOHN W. BURGETT, Guttenberg, N. J. Filed Oct. 9, 1901. Serial No. 78,052. (No model.)



Claim.—1. The combination with the elastic shoulder-webs A, the elastic web-sections C, the buckles C', attached to said web-sections, and adjustably engaging said shoulder-webs; of the rings B, attached to the said web-sections by the loops *c*, and to said shoulder-webs by the loops *a*, of the inelastic band E, connecting said shoulder-webs; and means for connecting the rings B, with the suspender-buttons of trousers, all substantially as shown and specified.

2. The combination with the elastic shoulder-webs A; the elastic web-sections C; the buckles C', attached to said web-sections, and adjustably engaging the said shoulder-webs A; the rings B, attached to said web-sections by the loops *c*, and to the said shoulder-webs by the loops *a*; of the inelastic band E, connecting said shoulder-webs; and the button-straps D, formed with members *d*, and *d'*, and arranged to connect said ring B, with the suspender-buttons of trousers, all substantially as shown and specified.

705,206. BOX FOLDING AND PASTING MACHINE. ROY J. CARRIER and JOHN W. LOW, Chicago, Ill., assignors to Howe and Davidson Company, Chicago, Ill., a Corporation of New Jersey. Filed Dec. 23 1901. Serial No. 86,965. (No model.)

Claim.—1. A machine for folding and pasting box-blanks, comprising feeding mechanism, pasting mechanism, an open-topped folding and pressing chamber over which the blanks are delivered by said feeding mechanism, means for forcing said blanks into said chamber to fold upwardly the marginal parts of said blank, means for folding inwardly said marginal parts of the blank to bring the edges thereof together, and means acting in each operation of the folding devices for ejecting from the bottom of said chamber the folded and pasted blanks.

2. A machine for folding and pasting box-blanks, comprising feeding mechanism, pasting mechanism, a deep, open-topped folding and pressing chamber over which the blanks are delivered by said feeding mechanism, said chamber being adapted to contain a mass of blanks arranged in superposed relation, means for forcing the blanks into the top of said chamber upon said mass of blanks to fold upwardly the marginal parts of the blanks, means for folding inwardly the marginal parts of the blanks to bring the edges thereof together, and means acting in each operation of the folding devices for ejecting from the chamber the bottom blank of the mass

3. A machine for folding and pasting box-blanks, comprising feeding mechanism, pasting mechanism, an open-topped folding and pressing chamber over which the blanks are delivered by said feeding mechanism, means for forcing the blanks into said chamber to fold upwardly the marginal parts of the blanks, swinging folding-fingers adapted to project laterally into the top of said chamber, means for moving said fingers bodily toward and away from said chamber and for swinging the inner ends thereof downwardly to fold inwardly the marginal parts of the blanks, and means for ejecting from the bottom of said chamber the folded and pasted blanks.

4. A machine for folding and pasting box-blanks comprising feeding mechanism, pasting mechanism, an open-topped folding and pressing chamber over which the blanks are delivered by said feeding mechanism, a vertically-reciprocatory plunger for forcing said blanks into said chamber to fold upwardly the marginal parts of said blanks, swinging folding-fingers adapted to project laterally into the upper parts of said chamber, means for moving said fingers bodily toward and away from the chamber and for swinging the inner ends thereof downwardly to fold inwardly said marginal parts of the blank, and means for ejecting from the bottom of said chamber the folded and pasted blanks.

5. In a machine for the purpose set forth, the combination with the folding and pressing chamber, of a reciprocating plunger which enters the open end of said chamber, pivoted folding-fingers which are adapted to project laterally into said chamber near the open end thereof, and means for moving said folding-fingers laterally toward and from the chamber, and for swinging the inner ends thereof vertically.

6. In a machine for the purpose set forth, the combination with the folding and pressing chamber, of a plunger adapted to enter the open end of said chamber, vibratory folding-fingers adapted to be projected laterally into said chamber near the open end thereof, rock-shafts to which said fingers are attached, laterally-extending slotted bearings in which said rock-shafts are supported, means for moving said fingers toward and away from said chamber, and means for swinging said fingers on their axis of vibration.

7. A machine for folding and pasting box-blanks comprising folding mechanism, pasting mechanism, an open-topped folding and pressing chamber, over which the blanks are delivered by said feeding mechanism, a reciprocating plunger for forcing the blanks into the said chamber to fold the marginal parts thereof upwardly between said plunger and the side walls of the chamber, means adapted to engage the blanks to prevent withdrawal thereof from the chamber in the retraction of said plunger, means for folding inwardly said marginal parts of the blank and means for ejecting the blanks from the bottom of said chamber.

8. A machine for folding and pasting box-blanks, comprising feeding mechanism, pasting mechanism, an open-topped folding and pressing chamber over which the blanks are delivered by said feeding mechanism, a vertically-reciprocatory plunger for forcing the said blanks into the said chamber to fold upwardly the marginal parts thereof between said plunger and the side walls of the chamber, projections on the inner surfaces of the chamber-walls adapted to engage the upwardly-folded marginal parts of the blank to prevent withdrawal of the same in the retraction of

the plunger, means for folding inwardly said marginal parts of the blanks, and means for ejecting from the chamber the folded and pasted blanks.

9. A machine for folding and pasting box-blanks, comprising feeding mechanism, pasting mechanism, an open-topped folding and pressing chamber over which the blanks are delivered by said feeding mechanism, said chamber being adapted to contain a mass of blanks arranged in superposed relation, means for forcing said blanks into said chamber to fold upwardly the marginal parts of the blanks, means for folding inwardly said marginal parts of said blanks, means for folding inwardly said marginal parts of the blanks, and a horizontally-movable pusher-plate in the bottom of said chamber for ejecting the lowermost blank of the mass in each operation of the machine.

10. A machine for folding and pasting box-blanks, comprising feeding mechanism, pasting mechanism, an open-topped folding and pressing chamber over which the blanks are delivered by said feeding mechanism, said chamber being adapted to contain a mass of blanks arranged in superposed relation, means for forcing said blanks into said chamber to fold upwardly the marginal parts of said blanks, means for folding inwardly said marginal parts of the blanks, means located near the bottom of the side walls of the chamber for sustaining the mass of blanks therein independently of the bottom wall of the chamber, and a horizontally-movable pusher-plate in the bottom of said chamber for ejecting the lowermost blank of the mass in each operation of the machine.

11. A machine for folding and pasting box-blanks, comprising folding mechanism, pasting mechanism, a deep, open-topped folding and pressing chamber over which the blanks are delivered by said feeding mechanism, said chamber being provided with upright side walls and being adapted to contain a mass of blanks arranged in superposed relation, means for forcing blanks into the said chamber upon the mass of blanks therein to fold upwardly the marginal parts of the blanks, means for folding inwardly said marginal parts of the blanks, plates attached to the inner surfaces of said side walls of the chamber, the lower edges of which plates extend obliquely into the chamber, and means acting in each operation of the folding devices for ejecting from the chamber the bottom blank of said mass.

12. In a machine of the character set forth, the combination with the folding and pressing chamber adapted to contain a mass of blanks arranged in superposed relation, means for forcing said blanks into said chamber upon the mass of blanks therein and for folding and pressing said blanks, plates attached to the inner faces of the side walls of the chamber, the lower edges of which plates extend obliquely into the chamber, spring-pressed prongs on the lower parts of said plates which project into the chamber beyond the plates, and a horizontally-movable pusher-plate in the bottom of the chamber for ejecting in each operation of the machine the lowermost blank of the mass from said chamber.

13. In a machine for the purpose set forth the combination with a folding and pressing chamber adapted to contain a mass of blanks arranged in superposed relation, means for forcing said blanks into said chamber upon the mass of blanks therein, and for folding and pressing said blanks, plates attached to the inner faces of said side walls of the chamber, the lower edges of which plates extend obliquely into the chamber, each of said plates being provided near its lower edge with two or more inwardly-extending yielding prongs, the prongs of each set being located one above the other, and a horizontally-movable pusher-plate in the bottom of said chamber for ejecting in each operation of the machine the lowermost blank of the mass from the chamber.

14. In a machine for the purpose set forth the combination with the feeding and pressing chamber adapted to contain a mass of blanks arranged in superposed relation, means for forcing said blanks into said chamber upon the mass of blanks therein and for folding and pressing said blanks, plates attached to the inner faces of the side walls of the chamber, the lower edges of which extend obliquely into the chamber, means for moving the lower edges of said plates toward and from each other, and means acting in each operation of the machine for ejecting from the chamber the bottom blank of the mass.

15. A machine for folding and pasting box-blanks comprising folding mechanism, pasting mechanism, a deep open-topped folding and pressing chamber over which the blanks are delivered by said feeding mechanism, said chamber being adapted to contain a mass of blanks arranged in superposed relation, means for forcing said blanks into the chamber upon said mass of blanks there into fold upwardly the marginal parts of the blanks, means for folding inwardly said marginal parts of the blanks, a movable pusher-plate in the bottom of said chamber, and coacting rollers at the side of said chamber in front of the pusher-plate adapted to receive in each operation of the machine the bottom blank of said mass which is advanced toward the rollers by said pusher-plate.

16. In a machine for the purpose set forth the combination with the folding and pressing mechanism adapted to contain a mass of blanks arranged in superposed relation, of means for forcing said blanks into the chamber upon the mass of blanks therein and for folding and pressing said blanks, a horizontally-movable pusher-plate in the bottom of said chamber, and coacting rollers at the side of said chamber in front of the pusher-plate adapted to receive in each operation of the machine the bottom blank of said mass which is advanced toward the rollers by said pusher-plate.

17. In a machine for the purpose set forth the combination with the pressing and folding chamber which is adapted to contain a mass of superposed blanks, of means for forcing into said chamber the blanks and for folding and pressing said blanks, a pusher-plate in the bottom of said chamber, coacting rollers at the side of said chamber in front of the pusher-plate adapted to receive, in each operation of the machine, the bottom blank of said mass, which is advanced toward said rollers by the pusher-plate, and a releasing device at the rear of said rollers constructed to release a single blank at a time.

18. In a machine for the purpose set forth the combination with the folding and pressing chamber adapted to contain a mass of blanks in superposed relation, of means for forcing the blanks into said chamber and for folding and pressing said blanks, a pusher-plate located in the bottom of said chamber, coacting rollers at the side of said chamber in front of the pusher-plate adapted to receive, in each operation of the machine, the bottom blank of said mass which is advanced toward the rollers by said pusher-plate, a releasing device resting on the bottom of said chamber in the rear of said rollers comprising a vertically-movable block provided on its rear surface with an inclined face adapted to be engaged by the forward margins of said blanks and a stop for limiting the vertical movement of said block.

19. In a machine for the purpose set forth the combination with the folding and pressing chamber adapted to contain a mass of blanks in superposed relation, of means for forcing said blanks into said chamber and for folding and pressing said blanks, a pusher-plate in the bottom of said chamber, coacting rollers at the side of said chamber in front of the pusher-plate adapted to receive, in each operation of the machine, the bottom blank of said mass which is advanced toward the rollers by said pusher-plate, a releasing device in the rear of said rollers comprising a vertically-movable block resting on the bottom of said chamber and provided on its rear surface with an inclined face adapted to be engaged by the forward margins of said blanks, a stop for limiting the vertical movement of said block, and means for adjusting said stop to provide a greater or less extent of movement in the block.

20. In a machine for the purpose set forth, the combination with a folding and pressing chamber adapted to contain a mass of blanks in superposed relation, of means for forcing said blanks into the chamber and for folding and pressing said blanks, a pusher-plate in the bottom of said chamber, coacting rollers located at the side of the chamber in front of the pusher-plate and adapted to receive, in each operation of the machine, the bottom blank of said mass which is advanced toward the rollers by means of said pusher-plate, and a releasing device located in rear of said rollers comprising a vertically-movable block provided on its rear surface with an inclined surface adapted to be engaged by the forward margins of the blanks, a rod attached to said block and extending, through apertured lugs on the chamber-wall, a spring applied to said rod to force said block against the bottom of said chamber, and a stop adapted to limit the vertical movement of said block.

21. In a machine for the purpose set forth the combination with a folding and pressing chamber adapted to contain a mass of blanks in superposed relation, of means for forcing said blanks into said chamber upon the mass of blanks therein and to fold and press said blanks, a pusher-plate in the bottom of said chamber, coacting rollers at one side of said chamber in front of the pusher-plate, means for separately feeding the blanks from the bottom of said mass into the path of said pusher-plate, and a releasing device located in rear of said rollers constructed to release one blank at a time from said chamber as it is advanced toward the rollers by said pusher-plate.

22. In a machine for the purpose set forth the combination with the folding and pressing chamber, adapted to contain a mass of blanks arranged in superposed relation, means for folding the blanks therein, a pusher-plate located in the bottom of said chamber, and means for separately feeding the lowermost blank of the mass of said blanks into the path of the pusher-plate in each operation of the machine.

23. In a machine for the purpose set forth, the combination with the pressing and folding chamber adapted to contain a mass of blanks arranged in superposed relation, of means adapted to force the blanks into said chamber and fold the same, plates on the inner faces of the walls of said chamber the lower edges of which extend obliquely into the chamber and which are provided at their lower edges with spring-pressed prongs, and means located below said plates for ejecting from the bottom of said chamber, the lowermost blank of the mass after it is forced downwardly between said prongs.

24. A machine for folding and pasting box-blanks comprising feeding mechanism, pasting mechanism, an open-topped folding and pressing chamber over which the said blanks are delivered by said feeding mechanism, means for forcing said blanks into said chamber and for folding and pressing the same therein, means for ejecting from the bottom of said chamber the folded and pasted blanks, a stop-plate located at the upper front part of the chamber against which the front margins of the blanks strike when delivered over the chamber, and means for adjusting said stop-plate in a direction from front to rear of the chamber.

25. A machine for folding and pasting box-blanks comprising feeding mechanism, pasting mechanism, an open-topped folding and pressing chamber over which the said blanks are delivered by said feeding mechanism, means for forcing said blanks into the chamber and for folding and pressing the blanks, means for ejecting from the bottom of said chamber the folded and pasted blanks, a stop-plate located at the upper front part of the chamber against which the front margins of the blanks strike when delivered over the chamber, means for adjusting said stop-plate in a direction from front to rear of the chamber, and depending bars attached at their upper ends to said stop-plates and extending across the front of the chamber.

26. In a machine for the purpose set forth, the combination with a folding and pressing chamber, of means for forcing the blanks into said chamber to fold upwardly the marginal parts of the blanks, vibratory folding-fingers adapted to project laterally into the said chamber and movable bodily toward and away from said chamber, actuating-rods operatively connected at their upper ends with said folding-fingers, and means for imparting both endwise and lateral movement to said actuating-rods.

27. In a machine for the purpose set forth, the combination with a folding and pressing chamber, of means for forcing the blanks into said chamber to fold upwardly the marginal parts of said blanks, vibratory folding-fingers adapted to project laterally into the top of said chamber and movable bodily toward and away from said chamber, actuating-rods operatively connected at their upper ends with said folding-fingers, rotative cams provided with cam-grooves in their peripheries and also on their side faces, horizontally-vibratory levers pivoted to the machine and provided with cam-studs adapted to engage the peripheral grooves of the cams, means for connecting said levers with said actuating-rods and parts to which said actuating-rods are pivoted at their lower ends provided with studs adapted to engage the cam-grooves in the side faces of the cams.

28. In a machine for the purpose set forth, the combination with an open-topped folding and pressing chamber having upright side walls over which the blanks are delivered, means for forcing the blanks into said chamber to fold upwardly the marginal parts thereof, vibratory folding-fingers adapted to project laterally into the top of said chamber and movable bodily toward and away from said chamber, actuating mechanism for said folding-fingers comprising rotative cams having cam-grooves in their peripheries and also in their side faces and actuating-rods operatively connected at their upper ends with said fingers and connected with parts at their lower ends having studs which engage said peripheral and side grooves of the cams, said side walls of the chamber being movable toward and away from each other to adjust the same to blanks of varying width, and the actuating mechanism for the fingers being connected and movable with said side walls.

29. The combination with a machine for folding and pressing box-blanks, of a movable receiving-table provided with a plurality of racks into which the blanks are deposited from the machine, actuating mechanism for said table, a discharging mechanism consisting of coacting rollers one of which is bodily movable each time a blank is discharged from the machine, and operative connections between the movable roller and the actuating mechanism for the table, embracing a counting device.

30. The combination with a machine for folding and pasting box-blanks provided with a discharging mechanism embracing coacting rollers, one of which is yielding to permit the blanks to pass therebetween, of a receiving-table provided with a plurality of racks into which the blanks are discharged in groups from the discharging mechanism of the machine, operative connections between said yielding roller and the actuating mechanism of the table, embracing a counting mechanism for advancing said table after each rack has been filled.

31. The combination with a machine for folding and pasting box-blanks having a discharging mechanism embracing coacting rollers, one of which is yielding to permit the blanks to pass therebetween, of a receiving-table provided with a plurality of racks into which the blanks are adapted to be deposited in groups, mechanism for turning or rotating said receiving-table, and means for setting said table-actuating mechanism into operation comprising a rotative wheel provided with an annular series of ratchet teeth or notches, means operatively connected with the movable roller for rotating the wheel step by step as the blanks are discharged between said rollers, and means on said wheel acting on the table-actuating mechanism to start said table-actuating means in operation.

32. The combination with a machine for folding and pasting box-blanks provided with a discharge mechanism having a part which is moved as each blank is discharged from the machine, of a receiving-table provided with a plurality of racks into which the blanks are deposited in groups, means for advancing said receiving-table embracing a pawl-and-ratchet mechanism, an endwise-movable bar operatively connected therewith, an oscillatory lever adapted for operative connection with said endwise-reciprocatory bar, means for holding said bar out of operative connection with said oscillatory lever and means for releasing said holding means to permit the bar to be operatively connected with said lever at determinate periods in the operation of the machine, embracing a counting device which is operatively connected with the movable part of the discharging mechanism.

33. The combination with a machine for folding and pasting box-blanks provided with a discharging mechanism, of a receiving-table provided with a plurality of racks into which the blanks are deposited from said machine, mechanism for actuating said table comprising a pawl-and-ratchet mechanism, an endwise-reciprocatory bar connected therewith, an oscillatory lever adapted at determinate periods in the operation of the machine for operative connection with said bar, means for holding said bar normally out of operative connection with said lever, a rotary wheel or disk, operative connections between said wheel or disk and the discharge mechanism of the machine, whereby said wheel or disk is rotated step by step as the blanks are discharged from the machine, and means on the disk for releasing the holding means for said bar to permit the latter to be operatively connected with said oscillatory lever.

34. The combination with a machine for folding and pasting box-blanks provided with a discharge mechanism, of a table provided with a plurality of racks in which the blanks are deposited, mechanism for turning said table embracing a pawl-and-ratchet mechanism, an endwise-reciprocatory bar connected at one end therewith, an oscillatory lever on the machine adapted to be operatively connected with said reciprocatory bar a swinging arm provided with a shoulder on which said bar normally rests and which holds said bar out of operative connection with said oscillatory lever, a rotative wheel or disk, operative connections between said wheel and the discharge mechanism of the machine whereby said wheel or disk is rotated step by step as the blanks are discharged from the machine, and means on said wheel or disk for swinging said holding-arm away from the reciprocatory bar to permit the latter to become operatively connected with said oscillatory lever.

35. The combination with a machine for folding and pasting box-blanks, of a revolving receiving-table provided with a plurality of racks into which the blanks are adapted to be deposited in groups, of mechanism for turning said table step by step comprising an annular ring attached to the lower side of the table, a swinging detent-lever provided with a pawl adapted to engage notches in said ring, a stop-dog actuated by a cam on said lever for stopping said table at the end of its step-by-step movement, and operative connections between said detent-lever and the discharge mechanism of the machine, whereby said lever is automatically operated to turn the table after a predetermined number of blanks have been deposited in each rack.

36. In a machine for the purpose set forth, the combination with the revolving receiving-table provided on its under surface with a concentric ring, a detent-lever pivoted concentrically with respect to said ring and provided with a pawl which is adapted to engage a series of notches in said ring, means for swinging said detent-lever, a tailpiece on said detent-lever, a stop-dog adapted to engage other notches in said ring, and a cam on said tailpiece adapted to act on said dog to free the same from said notches when the lever is swung to rotate the table, said cam being, in the continued movement thereof, released from the dog to permit the latter to engage one of said notches to arrest the movement of the table.

37. In a machine for the purpose set forth, the combination with the revolving receiving-table provided on its under surface with a concentric ring, a detent-lever pivoted concentrically with respect to said ring and provided with a pawl which is adapted to engage a series of notches in said ring, means for swinging said detent-lever, a tailpiece on said detent-lever, a stop-dog adapted to engage other notches in said ring, a cam on said tailpiece adapted to operate on said dog to free the same from the notches in said ring when the lever is swung to rotate the table, said cam in the continued movement thereof being released from the dog to permit the latter to engage one of said notches to arrest the movement of the table and means acting to prevent backward movement of the said table.

38. A machine for folding and pasting box-blanks comprising a folding and pressing chamber, means for folding and pressing said blanks in said chamber, intermittently-actuated forwarding mechanism for advancing the blanks to said folding and pressing chamber and means for detaining a blank in said forwarding mechanism while the folding and pressing mechanism is in operation.

39. A machine for folding and pasting box-blanks comprising folding and pressing mechanism and means for advancing the blanks to said folding and pressing mechanism comprising upper and lower carrier-belts

which frictionally engage the upper and lower surfaces of the margins of the blanks, means for arresting the blanks between said carrier-belts during the operation of the folding mechanism, means preventing the introduction of a blank to the carrier-belts when a blank is held or arrested between said belts, and pasting mechanism for applying paste to the blanks.

40. A machine for folding and pasting box-blanks comprising feeding mechanism, pasting mechanism, folding and pressing mechanism, stop-plates located one at the receiving end of the feeding mechanism and the other at the rear of the folding and pressing mechanism, and means for raising and lowering said stop-plates into and out of the path of said blanks.

41. A machine for folding and pasting box-blanks comprising feeding mechanism, pasting mechanism, mechanism for folding and pressing said blanks, a feed-board located at the rear of the feeding mechanism, stop-plates located one between said feed-board and the feeding mechanism and the other at the rear of the folding and pressing mechanism, oscillatory arms to which said stop-plates are attached, a rotary cam and operative connections between said rotary cam and oscillatory arm for raising and lowering said stop-plates into and out of the path of the blanks.

42. A machine for folding and pasting box-blanks comprising feeding mechanism, pasting mechanism, a folding and pressing chamber located in advance of the pasting mechanism, said feeding mechanism comprising upper and lower endless tapes, and said lower tapes extending on either side of said chamber, and the upper ones of which terminate in rear of said chamber, and stop-plates adapted to be moved upwardly between said tapes into the path of said blank, one of said stop-plates being located in rear of the feeding mechanism, and the other located between the upper belt of the feeding mechanism, and the said chamber.

43. A machine for folding and pasting box-blanks comprising feeding mechanism, pasting mechanism, a folding and pressing chamber located in advance of the pasting mechanism, said feeding mechanism comprising upper and lower endless tapes or belts, the adjacent laps of which coöperate to frictionally engage the blanks for carrying the same through the machine, said upper belts terminating in rear of said chamber, and the lower belts passing one on each side of said chamber to deliver the blanks over said chamber, a vertically-reciprocatory plunger for forcing the blanks into the chamber to fold the marginal parts thereof upwardly, and means for folding inwardly said marginal parts of the blanks.

44. A machine for folding and pasting box-blanks comprising folding and pressing mechanism, feeding mechanism for advancing the blanks to the folding and pressing mechanism, embracing upper and lower endless tapes which frictionally engage the upper and lower surfaces of the marginal parts of the blanks, guide-bars located outside of said tapes adapted for engagement with the margins of the blanks, means for moving said upper and lower tapes toward and from each other to adjust the same to varying widths of blanks and means for correspondingly varying the width of the space between said guide-bars.

45. A machine for folding and pasting box-blanks comprising pressing mechanism, feeding mechanism for advancing the blanks to the folding and pressing mechanism embracing upper and lower tapes adapted to frictionally engage the upper and lower surfaces of the marginal parts of the blanks, a rotary paste-disk located at one side of said upper and lower tapes for applying paste to the paste-flap of the blank, means for moving said tapes toward and away from each other to adjust the same to varying widths of blanks and for giving corresponding movement to said paste-wheel.

46. A machine for folding and pasting box-blanks comprising folding and pressing mechanism, feeding mechanism for advancing the blanks to the folding and pressing mechanism, embracing upper and lower endless tapes adapted to frictionally engage the upper and lower surfaces of the margins of the blank, the lower tapes extending one on each side of the folding and pressing mechanism, and the upper tapes terminating in rear of said folding and pressing mechanism, longitudinal guides located outside of said tapes and adapted to engage the side margins of the blanks, and downwardly-facing shoulders on said guides in front of said upper tapes, adapted to frictionally engage the upper surfaces of the blanks.

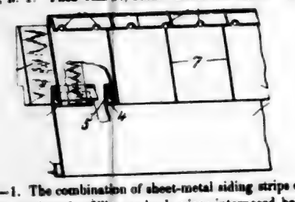
47. A machine for folding and pasting box-blanks comprising folding and pressing mechanism, feeding mechanism for advancing the blanks to the folding and pressing mechanism comprising upper and lower tapes which frictionally engage the upper surfaces of the blanks, rollers about which said tapes are trained, said lower tapes extending one on each side of the folding and pressing mechanism, and the upper tapes terminating in advance of said folding and pressing mechanism, longitudinal guide-bars arranged at each side of said tape adapted to engage the side margins of the blank, a transverse stop-bar at the front part of said folding and pressing mechanism, and a gage adapted to engage one corner of the blank and located just in rear of said transverse stop-bar.

48. In a machine for folding and pasting box-blanks, the combination with a folding and pressing chamber adapted to contain a mass of blanks in superposed relation, of means for forcing the blanks into said chamber upon said mass of blanks therein and for folding and pressing said blanks, a pusher-plate in the bottom of said chamber for separately ejecting the lowermost blank of the series from the chamber in each operation of the machine, and a jogging device at the rear of said chamber adapted to reciprocate toward and from the blanks and engage the rear margins thereof to maintain the rear end of said mass of blanks squared.

49. In a machine for folding and pasting box-blanks, the combination with a folding and pressing chamber adapted to contain a mass of blanks in superposed relation, of means for forcing the blanks into said chamber upon said mass of blanks therein and for folding and pressing said blanks, a pusher-plate in the bottom of said chamber for separately ejecting the lowermost blanks of the series from the chamber in each operation of the machine, and a jogging device at the rear of said chamber movable with said pusher-plate and adapted to reciprocate toward and from the blanks and engage the rear margins thereof to maintain the rear end of said mass of blanks squared.

50. In a machine for folding and pasting box-blanks the combination with a folding and pressing chamber, of means for forcing the blanks into said chamber upon the mass of blanks therein and for folding and pressing said blanks, a pusher-plate in the bottom of said chamber for separately ejecting the lowermost blank of the series from the chamber in each operation of the machine, and a stop located at one side of the pusher-plate and adapted for engagement with the rear margins of the lowermost blanks to prevent said plate from drawing the lowermost blank rearwardly out of the range of said pusher-plate.

705,207. SHEET-METAL SIDING. EDWIN G. CHARLESON, Watertown, N. Y. Filed Jan. 27, 1902. Serial No. 91,467. (No model.)



Claim.—1. The combination of sheet-metal siding strips or sections arranged end to end, and a filling or back piece interposed between the inner faces of the meeting ends of said strips or sections and the surface to which said strips or sections are secured for the purpose specified.

2. As a new article of manufacture a sheet-metal siding strip or section having its opposite longitudinal edges bent in opposite directions for forming interlocking flanges operating as described, one of said flanges having portions thereof cut away for forming cut-outs or recesses for permitting the insertion of the fastening members through the body of the strip or section.

3. As a new article of manufacture a sheet-metal siding strip or section having its opposite longitudinal edges provided with oppositely-turned flanges of unequal projection from the main body, said strips or sections being provided with transverse creases or scores for the purpose set forth, portions of the free edge of the upper flange being cut away at intervals to form recesses to receive the fastening members.

4. A sheet-metal siding strip or section having one of its longitudinal edges bent inwardly and upwardly and its other longitudinal edge bent outwardly and downwardly for forming opposite longitudinal flanges, the upturned edge of the former flange being separated a greater distance from the body of the strip or section than the free edge of the other flange.

705,208. CULTIVATOR. SAMUEL C. COES, Janesville, Wis., assignor to the Janesville Machine Company, Janesville, Wis., a Corporation of Wisconsin. Filed May 27, 1902. Serial No. 109,242. (No model.)

Claim.—1. In a wheel-cultivator, the combination of a cultivator-beam hinged at its forward end to swing vertically and horizontally, an arm pivoted vertically in the beam and extended horizontally and a lift-hitch connected with the swinging end of the arm.

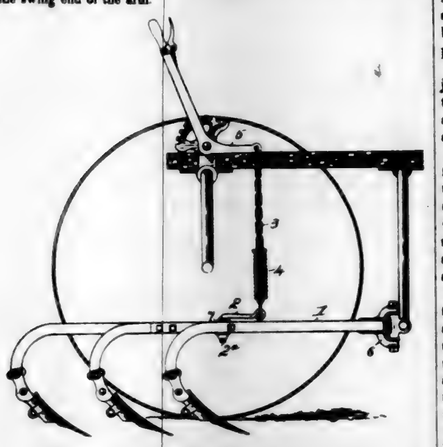
2. In a wheel-cultivator, the combination of a cultivator-beam hinged at its forward end to swing vertically and horizontally, an arm pivoted vertically in the beam and extended horizontally and a yielding lift-hitch connected with the swinging end of the arm.

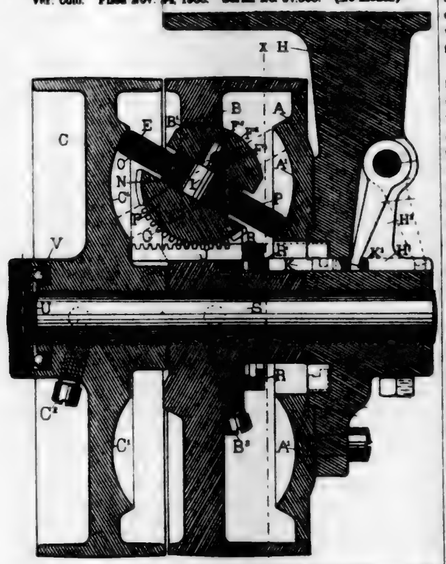
3. In a wheel-cultivator, the combination of a cultivator-beam hinged at its forward end to swing vertically and horizontally, an arm pivoted vertically in the beam and extended horizontally and a flexible, yielding lift-hitch connected with the swinging end of the arm.

4. In a wheel-cultivator, the combination of a cultivator-beam hinged at its forward end to swing vertically and horizontally, an arm pivoted vertically in the beam and extended horizontally, a lift-lever, and a yielding connection between the lift-lever and the swinging end of the arm.

5. In a wheel-cultivator, the combination of a cultivator-beam hinged at its forward end to swing vertically and horizontally, an arm pivoted vertically in the beam and extended horizontally, a lift-lever located above the beam in approximate alinement with the longitudinal center of the beam, when the beam is swung straight behind its pivot, an arm pivoted vertically in the beam and extended horizontally with its swinging end below the lift end of the lever, and a connection between the lever and the swing end of the arm.

705,209. VARIABLE-SPEED DEVICE. WALTER H. CRANE, Denver, Colo. Filed Nov. 24, 1900. Serial No. 37,085. (No model.)





Claim.—1. In a device of the class specified, the combination, with a support for the device, embodying a retarding means, of a drive-pulley, and a driven pulley; and means upon one of the said pulleys for varying the relative speeds of the pulleys.

2. In a device of the class specified, the combination with a support for the device, embodying a fixed supporting-shaft and a concentric fixed retarding-disk, of two adjacent pulleys revolvable on said shaft, and variably revolvable with reference to each other, from connective engagement with said retarding-disk.

3. In a device of the class specified, the combination with a support for the device, embodying a fixed supporting-shaft and a concentric fixed retarding-disk, of a speed-wheel embodying a pulley, revolubly mounted on said shaft; and an intermediate variation-wheel embodying a pulley, and variably engaging said speed-wheel and retarding-disk, to give variable relative velocities to said pulleys.

4. In a device of the class specified, the combination with a support for the device, embodying a fixed supporting-shaft and a concentric fixed retarding-disk, of a speed-pulley and a multiplying-pulley revolvable on said shaft and engaging said retarding-disk, to give multiplied speeds of said speed-pulley relative to said multiplying-pulley as a driving member, or divided speeds of said multiplying-pulley relative to said speed-pulley as a driving member.

5. In a device of the class specified, the combination with two adjacent pulley members and a supporting member, of a retarding-disk fixed to said supporting member; a central shaft fixed in one of said members and revolvable in the other said members; and means substantially as described, for varying the relative rotative speeds of the said pulley members.

6. In a device of the class specified, the combination with a support for the device, embodying a supporting-shaft and a concentric fixed retarding-disk, of a speed-wheel pulley revolvable about the axis of said shaft; an intermediate multiplying-wheel embodying a drive-pulley revolvable on said shaft; and a series of adjustable transmission-wheels carried by said multiplying-wheel, in engagement with opposing concave annular friction-surfaces on said retarding-disk and speed-wheel, to give a multiplied speed to said speed-wheel.

7. In a device of the class specified, the combination, with a central shaft, of a stationary retarding means concentric with, and in a plane at right angles to the said shaft; a speed-wheel rotatably mounted upon the shaft at some distance from, and parallel with the said retarding means; and an intermediate member, rotatably mounted upon the said shaft, and carrying a series of adjustable transmission-wheels in operative engagement with the said retarding means and with the said speed-wheel.

8. In a device of the class specified, the combination with a rotatable speed means provided with an annular concave contact-surface, of a retarding means embodying an opposing similar contact-surface; a power means embodying a pulley and a series of oscillatable carriers having segment-sustaining surfaces; transmission-wheels revolubly mounted in said carriers intermediate said segment-surfaces; a fixed support for the device; and means on said support connected with said carriers to oscillate them in said power means.

9. In a device of the class specified, the combination with a support for the device, having a fixed protruding central shaft, of a retarding-disk secured to said support and having a concave annular contact-surface; a drive and a delivery wheel rotatably mounted concentric with said shaft, one of said wheels having an opposing concave annular contact-surface similar to, and with its center of curvature coincident with that of the concave surface of said retarding-disk; a series of oscillatable carriers mounted in the other of said wheels; and a like series of transmission-wheels revolubly mounted in said carriers, in position and adapted to engage at their opposite sides with different portions of said opposing concave surfaces.

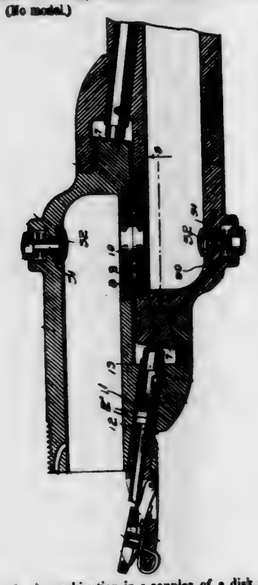
10. In a device of the class specified, the combination with a revolubly-mounted drive-wheel and driven wheel, of a retarding-disk; a series of oscillatable carriers, mounted in and revolvable with one of the said wheels; transmission-wheels revolubly mounted in the said carriers, and engaging at their opposite sides with suitable contact-surfaces upon the other of said wheels and said retarding-disk; a series of slidable racks in operative engagement with the said oscillatable carriers; an annular controlling-ring secured to the said racks; and a controlling-slide in engagement with said ring.

11. In a device of the class specified, the combination, with a bodily-rotatable series of oscillatably-mounted transmission-wheels, of similar, opposing, concave surfaces in engagement with the opposite sides of said oscillatable transmission-wheels; a slidable, annular ring having longitudinal projections in operative engagement with the carriers of said oscillatable transmission-wheels; a longitudinal slide in operative engagement with said ring; and means in engagement with said slide for moving the same longitudinally, to oscillate the said transmission-wheels and bring their opposite sides into engagement with different diameters of the respective engaging surfaces.

12. In a device of the class specified, the combination with a drive-wheel and an adjacent driven wheel mounted for rotation about an axis common to both of said wheels, of a retarding-disk having an annular concave surface, a section of which has a common center or foci, with a similar surface on one of said wheels; a series of oscillatable carriers mounted in the other of said wheels, and rotatable therewith, the center of oscillation of the said carriers being coincident with the said foci; an annular controlling-ring having connections to the said oscillatable carriers; means in connection with said controlling-ring and with a controlling-shaft and lever, for the oscillation of the said carriers; and a series

of transmission-wheels revolubly mounted in the said carriers, and engaging with different portions of the said concave surfaces as the carriers are oscillated.

705,210. TRAIN-PIPE HOSE-COUPLING. ARCHER S. CUMMINS and ANDREW J. BLAND, Crewe, Va. Filed Jan. 20, 1902. Serial No. 91,906. (No model.)



Claim.—1. A combination in a coupler, of a disk valve adapted to a seat at the inner portion of the coupler-head and fulcrumed at a point out of alinement with the air-passage, a spring for closing said valve, a pin adapted to engage with said valve to open the same, a spring normally tending to move the pin from contact with the valve, the head of said pin being disposed in the path of movement of a mating coupling, and a leakage-opening for permitting the reduction of the train-pipe pressure when the valve is closed.

2. The combination in a coupler, of a spring-pressed valve, a spring-pressed pin adapted to engage therewith, the head of said pin being disposed in the path of movement of a mating coupler, and means for limiting the movement of said pin.

3. The combination in a coupler, of a disk valve adapted to a seat at the inner portion of the coupling-head and fulcrumed at a point out of alinement with the air-passage, and a spring-pressed pin disposed in the path of movement of a mating coupler, and adapted to engage said valve.

4. The combination in a coupler, of the coupling-head, a bushing carried thereby, a pin guided in said bushing and having one end in the path of movement of a mating coupling, and a disk valve fulcrumed at a point to one side of the air-passage and adapted to be engaged by said pin.

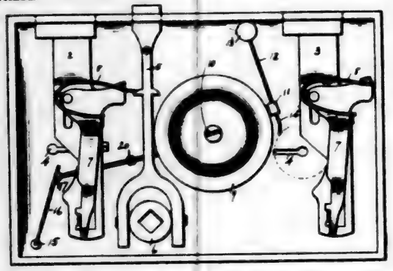
5. The combination in a coupler, of the coupling-head, a bushing carried thereby, a pin guided in said bushing and having one end in the path of movement of a mating coupling, said pin having a locking-groove, a valve adapted to be acted upon by said pin, and a locking-pin carried by the coupling-head for engagement in said locking-groove thereby to lock the valve in open position.

6. The combination in a coupler having cam-flanges, of a protecting-cover forming part of one of said flanges and adapted to close the recess of a mating coupling, substantially as specified.

705,211. ALARM-LOCK. ANTHONY COYNE, Hartranft, Penn. Filed Aug. 28, 1901. Serial No. 73,590. (No model.)

Claim.—1. In an alarm-lock the combination with the lock mechanism of a gong; a post mounted in the casing of the lock; a spring-lever connected to said post and having a laterally-extending pivotal seat 17; a shaft pivotally connected to core on said lever and means to adjust the length of said shaft and an extension carried by said spring-lever designed to be engaged by the key when the latter is moved to throw the bolt of the lock into an unlocked position, all combined substantially as specified and for the purpose set forth.

2. In an alarm-lock, the combination with the lock mechanism, of a gong, a post mounted within the lock-casing, a spring-lever connected at one end to said post, a shaft pivotally mounted in the free end of said lever, means for the longitudinal adjustment of said shaft, a guide for the free end of the shaft, and an extension on the lever beyond its connection with the shaft, to be engaged by the key, as and for the purpose specified.



705,212. INTERLOCKING COLLAR-FASTENER. HERBERT DALGETT, New York, N. Y. Filed Apr. 24, 1900. Serial No. 14,145. (No model.)

Claim.—1. An interlocking collar-fastener comprising an integrant connection having a suitable opening, clasps movably mounted on said connection, at opposite points thereof, and adapted to be moved one into a plane substantially parallel with the plane of said connection at one side thereof, and the other into a plane substantially parallel with the plane of said connection at the opposite side thereof, and a stud carried by one of said clasps, the said stud being capable of extending through the opening of said connection and formed centrally so as to detachably engage said connection at the opening therein and the free end of said stud being formed so as to engage the opposite clasp, when said clasps are moved to the position stated, as herein specified.

2. A device of the class set forth comprising a body portion, members as 3 3', movably connected to said body at opposite points thereof and operating on opposite sides thereof, and a locking element borne by one of said members, as 3', the said element being adapted to extend beyond the body portion, lock thereto and lock to the opposite member, as 3.

3. A device of the class set forth comprising a body, neckband-engaging and collar-clamping members movably connected to said body portion at opposite portions thereof, the said neckband-engaging and collar-clamping members each being provided with a closure-plate, and a locking element borne by the closure-plate of the neckband-engaging member, the said locking element being adapted to extend beyond the body portion and lock to the closure-plate of the collar-clamping member.

4. A device of the class set forth comprising a body portion having an elongated opening, neckband-engaging and collar-clamping members movably connected to said body portion at opposite points thereof, the said neckband-engaging and collar-clamping members being each provided with a closure-plate and a rolled edge, a wire in the rolled edge of each of said members, and a locking element borne by the closure-plate of the neckband-engaging member, the said locking element being adapted to extend partially beyond the body portion by way of the opening therein, and lock to the closure-plate of the collar-clamping member.

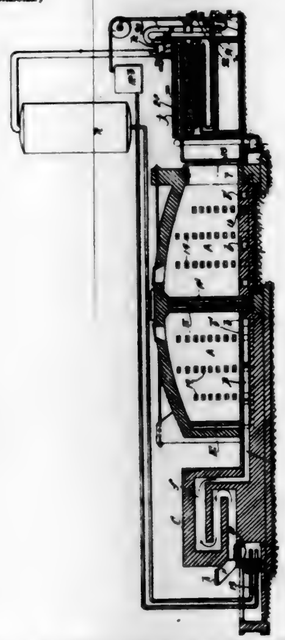
5. A device of the class set forth, comprising a body member, and neckband-engaging and collar-clamping members movably connected to opposite portions of the body member, the neckband-engaging member having a buttonhole-penetrating element which is adapted to lock to the body member and a portion of the clamping member.

6. A device of the class set forth, comprising a body member with a slot and locking element, a neckband-engaging member having a tongue to pass through said slot and receive the said locking element, and a collar-clamping member to lock on the tongue.

7. A device of the class set forth comprising a body, a neckband-engaging member, and a collar-clamping member, said neckband-engaging member and collar-clamping member being movably connected to opposite extremities of the body and operating on opposite sides of the latter, the neckband-engaging member also being partially movable through the body and adapted to lock to the latter and to a portion of said clamping member.

8. A device of the class set forth comprising a body, and neckband-engaging and collar-clamping members movably connected to the body at opposite portions thereof, and a resilient locking element borne by the neckband-engaging member, the said locking element being adapted to extend beyond the body and lock thereto and to the collar-clamping member.

705,213. METHOD OF CARBONIZING ORGANIC MATERIALS. OSCAR DAUBE, New York, N. Y. Filed Oct. 25, 1901. Serial No. 79,997. (No specimens.)

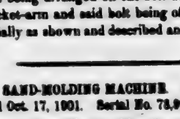


Claim.—1. The method of carbonizing organic material and material of organic origin which consists in mixing sixty-six and two-thirds per cent. air under a constant pressure of from five to eight pounds and thirty-three and one-third per cent. highly nitrogenous gas; passing the resultant gas through a coal fire; reducing the temperature of the gas issuing from the fire to from 400° to 600° Fahrenheit, subjecting the material to be carbonized to said last-mentioned gas at the said temperature of from 400° to 600° Fahrenheit and under the said pressure still constantly maintained and exhausting the gases emanating from said material during carbonization immediately they free themselves, substantially as set forth.

2. The method of carbonizing organic material and material of organic origin which consists in mixing sixty-six and two-thirds per cent. air under a constant pressure of from five to eight pounds and thirty-three and one-third per cent. highly nitrogenous gas recovered as by-product from carbonization of organic material, or material of organic origin or gases otherwise generated passing the resultant gas through a coal fire, reducing the temperature of the gas issuing from said fire to from 400° to 600° Fahrenheit, subjecting the material to be carbonized to said last-mentioned gas at the said temperature of from 400° to 600° Fahrenheit and under the said pressure still constantly maintained exhausting the gases emanating from said material during carbonization immediately they free themselves collecting and condensing the gases thus exhausted and collecting the by-products, substantially as set forth.

3. The method of carbonizing organic material and material of organic origin which consists in mixing sixty-six and two-thirds per cent. air and thirty-three and one-third per cent. highly nitrogenous gas recovered as by-products from carbonization of organic material or material of organic origin or like gases otherwise generated; passing the resultant gas through a coal fire, reducing the temperature of the gas issuing from said fire to from 400° to 600° Fahrenheit, preliminarily subjecting the material to be carbonized to said last-mentioned gas at the said temperature of from 400° to 600° Fahrenheit and under the said pressure still constantly maintained and simultaneously allowing the escape to the atmosphere of the vapors emanating from said material during said preliminary step, thus subjecting said material to be carbonized to said last-mentioned gas, cooling the carbonized material by subjecting same to the cooled gases emanating from the carbonizing process after they have been cooled in the condenser.

705,214. SUPPORT FOR AWNING-ROLLERS. LOUIS A. DAUB, Evansville, Ind. Filed Mar. 13, 1902. Serial No. 98,064. (No model.)



Claim.—1. In a device for supporting awning-rollers, the combination with a bracket-arm constructed to be rigidly secured in place intermediate the ends of the awning-roller, of a bolster pivoted to and universally movable on said bracket-arm, rigid spindles projecting laterally from the opposite sides of said roller-frame, and rollers journaled on said spindles and arranged to support the awning-roller between them, substantially as described.

2. In a device for supporting awning-rollers, the combination with a bracket-arm constructed to be rigidly secured in place intermediate the ends of and beneath the awning-roller, of a roller-frame loosely connected to and universally movable on said bracket-arm, four rigid spindles carried by said frame and projecting at right angles from the opposite sides of each end of said frame, and rollers journaled on said spindles and arranged to support the awning-roller between them, substantially as described.

3. In a device for supporting awning-rollers, the combination with a bracket-arm constructed to be rigidly secured in place intermediate the ends of the awning-roller, of a bolster pivoted to and universally movable on said bracket-arm, rigid spindles projecting laterally from the opposite sides of said roller-frame, rollers journaled on said spindles and arranged to support the awning-roller between them, and a bracket constructed to be rigidly fixed above the awning-roller and supporting a roller above and in front of the awning-roller, substantially as described.

4. In a device for supporting awning-rollers, the combination with a bracket-arm constructed to be rigidly secured in place intermediate the ends of the awning-roller, of a roller-frame loosely supported and universally movable on said bracket-arm, said frame comprising a bolster provided at each of its opposite ends with two laterally and oppositely projecting rigid spindles, means loosely connecting said bolster centrally to the end of the bracket-arm, and rollers journaled on said spindles, substantially as described.

5. In a device for supporting awning-rollers, the combination with a bracket-arm constructed to be rigidly secured in place intermediate the ends of the awning-roller, of a roller-frame loosely supported and universally movable on said bracket-arm, said frame comprising a bolster provided at each of its opposite ends with two laterally and oppositely projecting spindles formed integrally with said bolster, rollers journaled on said spindles, and a pivot-bolt loosely pivoting said bolster centrally to the end of the bracket-arm, substantially as described.

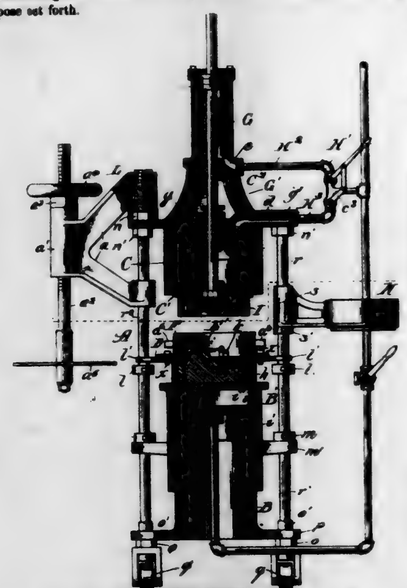
6. In a device for supporting awning-rollers, the combination with a bracket-arm constructed to be rigidly secured in place intermediate the ends of the awning-roller and having a bolt-hole in its outer end, of a roller-frame loosely seated and universally movable on said bracket-arm, said frame comprising a bolster provided centrally with a bolt-hole and provided at each of its opposite ends with two laterally and oppositely projecting integral spindles, rollers journaled on said spindles and a headed bolt loosely passing through said bolt-holes and provided on its lower end with a nut, said nut being arranged on the bolt at a point below the under side of the bracket-arm and said bolt being of less diameter than the bolt-holes, substantially as shown and described and for the purpose specified.

705,215. SAND-MOLDING MACHINE. JOHN R. DAVIS, Waukegan, Ill. Filed Oct. 17, 1901. Serial No. 78,978. (No model.)

Claim.—1. In a sand-molding machine, the combination with a frame, of a lower cylinder provided with a piston, a pattern-plate supported on said piston, an intermediate cylinder provided with a piston, an impression-plate supported on said last-named piston and opposed to the pattern-plate, an uppermost cylinder, a rod extending upward from said last-named piston and carrying at its upper end a piston movable in said uppermost cylinder, and fluid-pressure mechanism for actuating the pistons of the several cylinders, substantially as and for the purpose set forth.

2. A sand-molding machine comprising, in combination, a frame A formed of upright posts, a cylinder B supported on said frame and having a piston B', a pattern-plate E supported on said piston, a slot-plate D movably supported on the frame above said piston, a flask F carried

by said piston, a cylinder C supported on said frame and having a piston C' provided with a rod C^2, a cylinder G containing a piston C^3 on the upper end of said rod, and a fluid-pressure-supply pipe H for directing fluid-pressure against the several said pistons and provided with valves for controlling the direction of said pressure, substantially as and for the purpose set forth.



3. A sand-molding machine comprising, in combination with a frame, a lower cylinder B provided with a piston B', a pattern-plate E supported on said piston, an intermediate cylinder C, containing a piston C', an uppermost cylinder G containing a piston C^3, an impression-plate I on said piston C' opposed to the pattern-plate, a rod C^2 connecting said pistons C' and C^3, channels *d* and *e* leading, respectively, into the upper end of the cylinder C and into the lower end of the cylinder G, a fluid-pressure-supply pipe H containing a three-way valve *f* and leading through the lower cylinder to said piston, a coupling H' through which the said pipe is connected with said channels, and oppositely-arranged three-way valves *c* and *c'* in said coupling, the whole being constructed and arranged to operate substantially as and for the purpose set forth.

705,216. ARTIFICIAL FUEL. JOHN T. DAVIS, San Francisco, Cal. Filed Aug. 7, 1900. Serial No. 26,177. (No model.)

Claim.—1. A binder for artificial fuel composed of pitch, hardened and toughened by free carbonic-acid gas.

2. An artificial fuel composed of pitch hardened and toughened by free carbonic-acid gas, and carboniferous material in a divided condition, all mixed and incorporated in substantially the proportions specified.

3. The process of manufacturing artificial fuel, consisting of mixing pitch with a carbonate, applying heat to the mixture to obtain free carbonic-acid gas and adding a carboniferous material to the resulting mass, as and for the purpose specified.

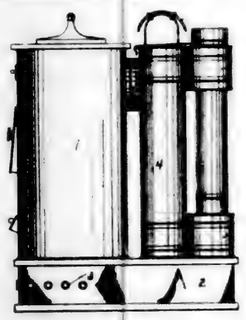
4. The process of making artificial fuel, which consists in mixing approximately one hundred parts of pitch with approximately thirty parts of a carbonate, heating to obtain free carbonic-acid gas, and then adding to the resulting mass approximately one thousand parts of carboniferous material, as and for the purpose described.

5. The process of making artificial fuel, consisting of treating a mixture of from sixty to one hundred and eighty parts of pitch with thirteen to sixty parts of carbonic-acid gas, and adding one thousand parts, by weight, of carboniferous material, as and for the purpose specified.

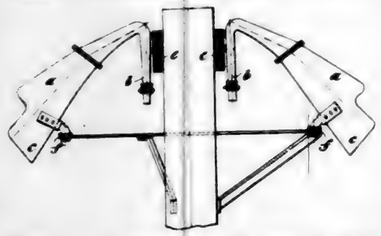
6. An artificial fuel derived from substantially the following ingredients: sixty to one hundred and eighty parts pitch, thirteen to sixty parts carbonic acid, and one thousand parts carboniferous material.

705,217. HEATING-DRUM. CHARLES W. DAVIDSON, Tonti, Ill. Filed Aug. 31, 1901. Serial No. 74,023. (No model.)

Claim.—A combined heating stove and drum comprising a hollow base having air-ducts, a stove and drum mounted on said base, the drum comprising an inner and outer section, the inner being coupled to the exit-flue of the stove, a series of vertical air-flues open at both ends formed in the inner section of the drum and communicating at their bottom with the outer air through the ducts of the hollow base, a hood surmounting the series of air-flues, a series of flues and upper and lower chambers coupled together and collectively forming the outer drum-section, the products passing from the stove around the air-flues of the inner drum-section, to the bottom of the drum, thence upward through the lower chamber of the drum, the flues, and upper chamber respectively, and finally out into the atmosphere, substantially as set forth.



705,218. EAR-TRUMPET. EMILE DE MEULENEESTER, Brussels, Belgium. Filed Jan. 18, 1902. Serial No. 90,334. (No model.)



Claim.—1. A sound-receiving device comprising a suitably-supported trumpet, the open end or mouth of which trumpet is directed downwardly at a suitable angle, and the lower and lateral portions of the mouth of which trumpet extend beyond the upper portion of said mouth, the small end of said trumpet being adapted to be connected with a suitable means for receiving the sonorous waves collected by said trumpet.

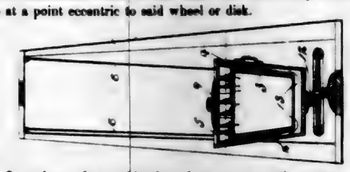
2. A sound-receiving device comprising a trumpet, made in one or more parts, of any suitable material, said trumpet being fixed to a support and having its mouth or open end directed downwardly at a suitable angle, the lower and lateral portions of said mouth being extended beyond the upper portion of said mouth, and the small or inner end of said trumpet being connected with a suitable means for receiving the sonorous waves collected by said trumpet.

3. A sound-receiving device comprising a plurality of trumpets fixed to a suitable support, the mouth or open end of each of said trumpets being directed downwardly at a suitable angle and the lower and lateral portions of the mouth of each of said trumpets being extended beyond the upper portion of the mouth of each of said trumpets, the small end of each of said trumpets being connected with a suitable means for receiving the sonorous waves collected by said trumpet.

4. A sound-receiving device comprising a plurality of trumpets fixed to a suitable support, the open end or mouth of each of said trumpets being directed downwardly at a suitable angle and the upper portion of the mouth of each of said trumpets being cut away, so that the lower and lateral portions of the mouth of each of said trumpets extend beyond the upper portion of said mouth, the small end of each of said trumpets being connected with a suitable means for receiving the sonorous waves collected by said trumpet.

705,219. CHURN. JOHN DEMPSTER and WILLIAM S. BRADLEY, Knoxville, Tenn. Filed Nov. 4, 1901. Serial No. 81,135. (No model.)

Claim.—1. In a churn, the combination of an outer movable churn-body provided with inwardly-projecting blades, a second vessel suspended therein, revolving therewith and having a perforated bottom, means suspending said churn-body from a support, and a horizontally-revoluble balance or momentum wheel or disk below the churn-body and pivoted thereto at a point eccentric to said wheel or disk.



2. In a churn, the combination of an outer vessel, an inner vessel suspended therein and having a perforated bottom, approximately tangential wings or blades projecting outward from the top of the inner vessel, and a balance or momentum wheel to which the churn-body is eccentrically pivoted.

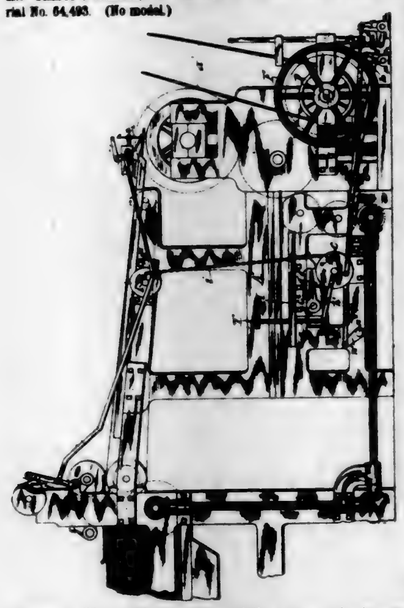
3. A churn-body, flexible rods supporting said body and a horizontally-revolubie balance or momentum wheel to which said churn-body is eccentrically connected.

4. A churn-body, a plurality of flexible rods projecting upward from a suitable base and then inward and downward, a balance or momentum wheel to which the body is eccentrically pivoted, and means securing said rods to said body, whereby they serve as a support therefor.

5. In a churn, the combination of an outer movable vessel or body, greater in diameter at the top than at its base and provided with inwardly-deflecting blades, a second vessel interposed in said outer vessel, revolving therewith and having perforations at its bottom, means for supporting said churn, a horizontal momentum-wheel, and means connecting said churn-body and wheel eccentric to the axis of said wheel.

6. In a churn, the combination of an outer vessel or churn-body, greater in diameter at the top than at the bottom, a second vessel interposed therein, stationary with respect to said outer vessel or body, removable therefrom, and provided with perforations or openings at or near its bottom, and with diverter blades or wings at its top, means flexibly supporting said churn-body, and a horizontal momentum or balance wheel eccentrically connected to said churn-body.

705,220. AUTOMATIC PROTECTOR FOR PRINTING-PRESSES, &c. TALBOT C. DEXTER, Pearl River, N. Y. Filed June 14, 1901. Serial No. 64,493. (No model.)



Claim.—1. The combination with a printing-press, mechanism supplying the paper to said press, and stop mechanism actuated to automatically arrest the action of the press, of a vertically-disposed pivoted disk, variable mechanism imparting different degrees of oscillations to said disk, a feeler actuated by the paper in transit to the press and controlling said variable mechanism, and a latch restraining the aforesaid stop mechanism and thrown from its restraining position by the increased motion of the aforesaid disk.

2. The combination with a machine designed to operate on paper passing through it, and stop mechanism actuated to automatically arrest the action of said machine, of a latch restraining the stop mechanism, a primary cam, a lever oscillated by said cam, a rock-shaft receiving motion from said lever, a feeler disposed to be actuated by the paper in transit to the aforesaid machine and controlling said rock-shaft to restrain the movement of the aforesaid lever to the primary cam, and a supplemental cam actuating the restrained lever to trip the latch from its operative position as set forth.

3. The combination with a machine designed to operate on paper passing through it, and stop mechanism actuated to automatically arrest the action of said machine, of a latch restraining the stop mechanism, a primary cam and a supplemental cam disposed with a path between them, a lever pivoted in position to be actuated by one of said cams at a time, and receive different degrees of thrust therefrom, a pivoted disk oscillated by said lever, a coupling between said disk and latch to trip said latch from operative position by the greater thrust of the lever, a rock-shaft moving in unison with said disk, a feeler disposed to be actuated by the paper in transit to the aforesaid machine and controlling the operative position of the aforesaid lever through the medium of the rock-shaft and disk as set forth.

4. The combination with a printing-press and its actuating mechanism, a vertically-disposed stop-disk connected to said actuating mechanism, a spring-pushed rod turning said disk to arrest the actuating mechanism, a lug projecting from said disk, a latch adapted to engage said lug, a lever for turning the disk in a direction to release the actuating mechanism and to a position to allow the latch to engage the lug, a pivoted tripper-disk coupled to said latch, a primary cam and a supplemental cam disposed with a path between them, a lever pivoted in position to be actuated by said cams one at a time and receive different degrees of thrusts therefrom, a rod transmitting motion from said lever to the tripper-disk, feelers disposed to be actuated by the paper in transit to the printing-press, a rock-shaft controlled by said feelers, and a rod transmitting motion from the tripper-disk to said rock-shaft as set forth.

5. The combination with a printing-press, its actuating mechanism, spring-actuated stop-disk connected to said mechanism, a latch restraining said stop-disk, feelers disposed to be actuated by the paper in transit to the press, a rock-shaft controlled by said feelers, a primary cam and a supplemental cam projecting different distances from their axis and disposed with a path between them, a lever having pivoted to it a roller adapted to pass through said path and to be traversed by either of the two cams, means for controlling said lever by the aforesaid rock-shaft, and a guard guiding the roller of the lever from the primary cam to the supplemental cam as set forth.

6. The combination of a primary cam and a supplemental cam revolving in unison about the same axis and disposed with a path between them, a lever having pivoted to it a roller adapted to pass through said path and to be traversed by either of the two cams, a wedge fastened to the side of the supplemental cam, a wedge attached to the lever beyond the roller thereof and pointing toward the wedge on the cam to guide the said roller from the primary cam to the supplemental cam, and mechanism controlling the position of the lever in relation to the cams as set forth.

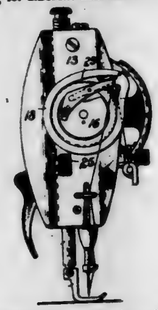
705,221. ROTARY TAKE-UP DEVICE FOR SEWING-MACHINES. PHILIP DUBEL and MARTIN HENLES, Elizabeth, N. J., assignors to The Singer Manufacturing Company, a Corporation of New Jersey. Filed Dec. 30, 1901. Serial No. 87,780. (No model.)

Claim.—1. In a sewing-machine, the combination with a rotary take-up comprising an arm on which the needle-thread can slide out and in from and toward the center of movement of said take-up, of an automatically-operated thread-detaining device mounted on said arm and serving to control the take-up and the cast-off or thread-slackening operations.

2. In a sewing-machine, the combination with a rotary take-up, of a cast-off-controlling device, a presser-foot, and connections between the said presser-foot and cast-off-controlling device; whereby the timing of the operation of the said cast-off-controlling device will be varied with the varying thickness of the work beneath the presser-foot.

3. In a sewing-machine, the combination with a rotary take-up comprising an arm extending outward from the center of movement of the take-up, and on which the needle-thread can slide in and out, of a lever providing a thread-detaining shoulder on said arm, and a normally stationary cam for operating said lever.

4. In a sewing-machine, the combination with a rotary take-up comprising an arm extending outward from the center of movement of the take-up, and on which the needle-thread can slide in and out, of a lever providing a thread-detaining shoulder on said arm, a normally stationary cam for operating said lever, a presser-foot, and connections between said presser-foot and said cam whereby the position of the latter will be varied to change its timing for different thicknesses of work.



5. In a sewing-machine, the combination with a rotary take-up, of a normally stationary thread-controller having a cast-off part, a presser-bar, and connections between said presser-bar and said normally stationary thread-controller; whereby when the presser-foot is raised or lowered the position of the cast-off part of said normally stationary thread-controller will be correspondingly varied.

6. In a sewing-machine, the combination with a rotary take-up, of a thread-detaining and cast-off-controlling device movable and coöperating with said rotary take-up, and a normally stationary thread-controlling device adjacent to and also coöperating with said rotary take-up, and serving to control the slack thread first given up by said take-up after a stitch has been tightened.

7. In a sewing-machine, the combination with a presser-foot and a rotary take-up having an arm on which the thread can slide in and out, of a thread-detaining lever on said arm, a normally stationary cam for operating said lever, a normally stationary coöperating thread-controlling device having a cast-off part, and connections between said cam and said normally stationary thread-controlling device whereby the position of the latter and of the said cam will be automatically varied, to change the timing, with variations of the thickness of work.

8. In a sewing-machine, the combination with a rotary take-up comprising a take-up arm on which the thread can slide outward for take-up position and inward for thread-slackening position, and which arm consists of two separated parts or plates, of a thread-detaining and cast-off-controlling lever mounted between said separated parts of said arm, and a normally stationary cam for operating said lever.

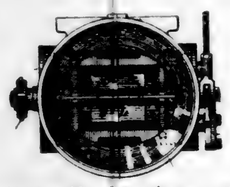
9. In a sewing-machine, the combination with a rotary take-up comprising a take-up arm on which the thread can slide outward for take-up position and inward for thread-slackening position, and which arm consists of two separated parts or plates, of a thread-detaining and cast-off-controlling lever mounted between said separated parts of said arm, a normally stationary cam for operating said lever, and a coöperating normally stationary thread-controlling device.

10. In a sewing-machine, the combination with a rotary take-up comprising a take-up arm on which the thread can slide outward for take-up position and inward for thread-slackening position, and which arm consists of two separated parts or plates, of a thread-detaining and cast-off-controlling lever mounted between said separated parts of said arm, a normally stationary cam for operating said lever, a coöperating normally stationary thread-controlling device having a cast-off part, a presser-bar, and connections between said presser-bar and said cam and thread-controlling device; whereby the timing of the operation of said lever and thread-controller will be automatically varied for different thicknesses of work beneath the presser-foot.

705,222. FEED APPARATUS FOR WEBBING OR PACKAGING MACHINES. WILLIAM H. BUELL, Quincy, Mass., assignor to Pneumatic Seals Corporation, Portland, Me., a Corporation of Maine. Filed Feb. 14, 1902. Serial No. 94,077. (No model.)

Claim.—1. In combination with a chute or hopper, a rotary stirrer, a gate to the outlet beneath said stirrer having an opening therethrough and an upturned lip, substantially as described.

2. In combination with a chute or hopper, a gate to the outlet having an opening therethrough, a lip projecting upward from the edge of said opening, and a rotary stirrer whose axis of revolution is crosswise of the hopper above said gate and having stirrer-blades with recesses to permit clearance between the stirrer and said lip, substantially as described.



3. In combination with a chute or hopper, a gate to the outlet having an opening therethrough, means of adjusting the said gate to vary the size of opening, a lip projecting upward from at or near the edge of said opening and a rotary stirrer whose axis of revolution is crosswise of the hopper above said gate, substantially as described.

4. In combination with a chute or hopper, a rotary stirrer which rotates the goods in a cylindrical mass and a blade which engages the periphery of the rotating mass and separates fine portions thereof, substantially as described.

5. In combination with a chute or hopper, a stirrer, a gate to the outlet and a lip at the edge of the outlet extending into the path of rotation of the mass of material moved by the stirrer, substantially as described.

6. In combination with a chute or hopper, means for rotating the material in a cylindrical mass and a scraper which engages the periphery of the rotating mass and separates fine portions thereof, substantially as described.

7. In combination with a chute or hopper, means for rotating within the hopper the material fed therein, an inclined scraper which is adapted to remove from the revolving mass portions thereof, and an outlet-passage for the removed portions, substantially as described.

8. In combination with a chute or hopper, a stirrer-chamber in the lower part of the chute or hopper, a stirrer which rotates on a horizontal axis in said chamber, a valve beneath said stirrer having a graduated passage therethrough, a lip which extends up into the path of the radius of rotation of said stirrer and recesses formed in the stirrer-blades to afford clearance for the said lip, substantially as described.

9. In combination with a chute or hopper, a gate consisting of an adjustable plate or plates whereby a contracted passage may be produced, a revolving head carrying stirrer-blades which revolve in said hopper, a lip which projects upward from at or near the edge of the opening in said gate and recesses in the stirrer-blades to afford clearance for the said lip, substantially as described.

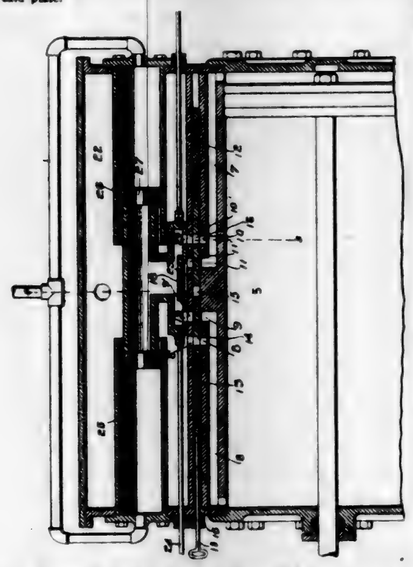
10. In combination with a chute or hopper, a gate having a narrow passage therethrough, a rotary stirrer above said gate, a lip which projects upward from at or near the edge of said passage, and a second valve below said first gate which can be entirely closed, substantially as described.

705,223. BOX OR CASE. ERNST DOERING, Berlin, Germany. Filed Feb. 13, 1901. Serial No. 47,115. (No model.)

Claim.—The combination with a box or case, having a socket or recess formed in the upper edge of one end wall, and a vertical pin or stud arranged within said socket, of a top or lid, a slotted plate secured against the under surface of the top or lid and adapted to extend through said socket in the end wall of the box and engage the pin therein when the lid is moved in one direction over the box, fastening means secured to the top for engaging others on the sides of the box as the lid is moved laterally as aforesaid, and supplemental means for preventing movement of the lid on the box in a direction to disengage said fastenings.

705,224. VALVE FOR ENGINES. ERNEST U. DOWS, Hoskins, Ohio, assignor of one-fourth to August C. Bell, Waterville, Ohio. Filed Jan. 11, 1902. Serial No. 89,236. (No model.)

Claim.—1. In an engine, the combination of the cylinder having a pair of steam-ports each terminating at the steam-chest end in a plurality of openings, a plate mounted above the ports and provided with openings alining with those of the steam-ports, a reversing-slide disposed below said plate and having ports or passages movable into alinement with either set of openings, and a hollow ported valve adapted to reciprocate on said plate.



2. The combination in an engine, of the cylinder and steam-chest, cylinder-ports extending from each end of the cylinder to the steam-chest and terminating at the steam-chest end in a plurality of openings, a fixed plate arranged in the lower portion of the steam-chest and forming the valve-support, said plate having openings alining with those leading to the cylinder-ports, a reversing-slide disposed below the plate and having three ports movable into alinement with the said openings to change the direction of the flow of steam, and a hollow ported valve disposed on said plate and having an internal steam-supply, substantially as specified.

3. A valve comprising a hollow ported body having cylindrical extensions, a pair of open-ended cylinders into which said cylindrical extensions project, and loose pistons adapted to said cylinders, said pistons being pressed snugly against the ends of the valve by steam-pressure and permitting independent movement of the valve toward its seat.

4. The combination of the alining cylinders, loose pistons arranged in said cylinders and having steam-passages and a hollow ported valve having end portions in contact with the adjacent faces of said pistons.

5. The combination of the steam-chest, a pair of alining cylinders arranged therein, loose pistons adapted to said cylinders and provided with steam-passages, a ported valve having its body portion extending laterally into the respective cylinders and adapted for contact with the pistons therein, and means for reciprocating said valve.

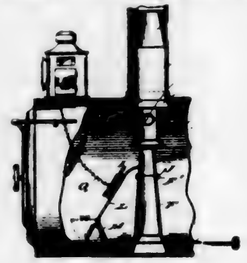
6. The combination of the steam-chest having end openings, a pair of removable cylinders arranged therein and connected to a source of steam-supply, pistons adapted to said cylinders and provided with steam-passages, a ported valve having portions extending laterally into the respective cylinders and adapted for contact with the pistons therein, and exhaust-ports leading from the cylinder to the body of the steam-chest and entirely surrounding the cylinders, substantially as specified.

705,225. FORCED-DRAFT APPLIANCE FOR LOCOMOTIVES. JOSEPH A. ROSS, Rawlins, Wyo. Filed Dec. 7, 1901. Serial No. 85,191. (No model.)

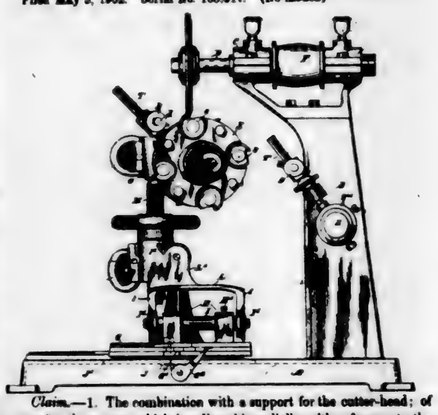
Claim.—1. In combination with the exhaust-nozzle and petticoat arranged a predetermined distance apart within the smoke-box, and exhaust-tubes leading from the cylinders to the exhaust-nozzle, the stack provided with a gradually-tapering choke-ring terminating at, and contracting the final exit area of the smoke-stack, substantially as and for the purposes set forth.

2. In combination the stack having a choke-ring located within its exit, and with the nozzle-stand, nozzle-tip and petticoat within the smoke-box, the draft-plate L, with hinged section, M, and an operating-rod N, leading to the cab, substantially as and for the purpose set forth.

3. The combination and arrangement of the stack having a choke-ring within its exit, the petticoat, nozzle-tip and nozzle located within the smoke-box, and a diagonally-arranged draft-plate with hinged bottom section, provided with means for operating the same, an air-damper arranged in the stoking-door, and provided with a downwardly-inclined deflecting-wall, substantially as and for the purposes set forth.



705,226. GRINDING-MACHINE. JOEL ETTINGER, Chester, Pa., assignor to the Ettinger Machine Company, Limited, Chester, Pa. Filed May 3, 1902. Serial No. 105,817. (No model.)



Claim.—1. The combination with a support for the cutter-head; of a gage for the cutters which is adjustable radially with reference to the axis of the cutter-head and also in a direction parallel with such axis.

2. The combination with a support for the cutter-head; of a gage for the cutters adjustable radially with reference to the axis of the cutter-head, and also in an arc about an axis parallel with the axis of the cutter head, but outside the arc in which the cutter moves.

3. The combination with a support for the cutter-head; of a gage for the cutters adjustable radially with reference to the axis of the cutter-head, and also in an arc outside of the plane of rotation of the cutters but struck from the axis of the cutter-head.

4. The combination with a support for a cutter-head; of a gage for the cutters adjustable radially with reference to the axis of the cutter-head in a direction parallel with said axis, in an arc about the axis of the cutter-head, and also about an axis perpendicular to the axis of the cutter-head.

5. The combination with a support for a cutter-head; of a gage-finger having an inclined edge or face next the cutters, and means for adjusting said gage-finger toward and from the axis of the cutter-head, and also in a direction parallel therewith.

6. The combination with a support for a cutter-head; of a collar surrounding the axis of the cutter-head; a rod projecting therefrom; an arm projecting laterally from said rod; a gage-finger carried by said arm; means for adjusting the collar about the axis of the cutter-head, and devices for adjusting the laterally-projecting arm on its supporting-rod.

7. The combination with a support for a cutter-head; of a rod projecting radially with reference to the axis of the cutter-head; a laterally-projecting arm on said rod; a sliding sleeve carried by said rod; devices for clamping the sleeve to the rod; a sliding sleeve on the rod to which the laterally-projecting arm is attached; a nut interposed between the two sleeves for adjusting the sleeve carrying the arm; and a gage-finger carried by the laterally-projecting arm.

8. The combination with a support for a cutter-head; of a rod projecting laterally with reference to the axis of the cutter-head; a laterally-projecting arm supported by said rod; a collar on said arm adjustable longitudinally thereon, and also about the axis thereof; and a gage-finger carried by said collar adjustable about an axis perpendicular to the axis of said collar-supporting arm, and also toward and from said arm.

9. In a grinding-machine the combination with a grinding-wheel and a support for the cutter-head; of means for adjusting the support for the cutter-head relatively to the grinding-wheel; and a gage for the cutters outside their path of rotation which is adjustable radially with reference to the axis of the cutter-head, and also in a direction parallel with said axis.

10. In a grinding-machine the combination of a grinding-wheel; a platform adjustable in a direction parallel with the axis of the grinding-wheel; a carriage mounted on the platform and movable thereon in a direction perpendicular to the axis of the grinding-wheel; a vertically-adjustable spindle carried by the carriage; means for holding the spindle in its adjusted position; a clamp-socket on the upper end of the spindle and adapted to turn thereon without moving the spindle; means for clamping the socket on the spindle; a casting carried by said clamp-socket and turning therewith, and an arbor carried by said casting.

11. In a grinding-machine the combination of a grinding-wheel; a platform adjustable relatively thereto; a guiding-standard rising from said platform; a carriage having an arm guided by said standard at one end; means for supporting and guiding the opposite end of the carriage; a vertically-adjustable spindle carried by the carriage; means for preventing the spindle from turning; devices for clamping the spindle in its adjusted position; a clamp-socket carried on the upper end of the spindle and adapted to turn thereon without moving the spindle, means for clamping the socket on the spindle, a casting carried by said clamp-socket and turning therewith, and an arbor carried by said casting.

12. In a grinding-machine the combination of a grinding-wheel; a platform; a carriage supported thereon and guided thereby; a socket-piece on the carriage; a vertically-adjustable spindle extending from said socket-piece; means for enlarging or decreasing the vertical opening in said socket-piece; a screw-threaded hand-wheel resting on the socket-piece and engaging the vertically-adjustable screw-threaded spindle; devices for preventing the spindle from rotating; means for clamping the spindle in its adjusted position; and an arbor for a cutter-head supported on the upper end of said spindle.

13. In a grinding-machine the combination of a grinding-wheel; a carriage movable transversely to the axis of the grinding-wheel; a vertically-adjustable spindle supported on the carriage; a clamp-socket adjustable about the axis of the spindle; a casting connected with said clamp-socket; an arbor for a cutter-head carried by said axis; and devices for tilting or adjusting the casting about an axis perpendicular to the axis of the vertically-adjustable spindle.

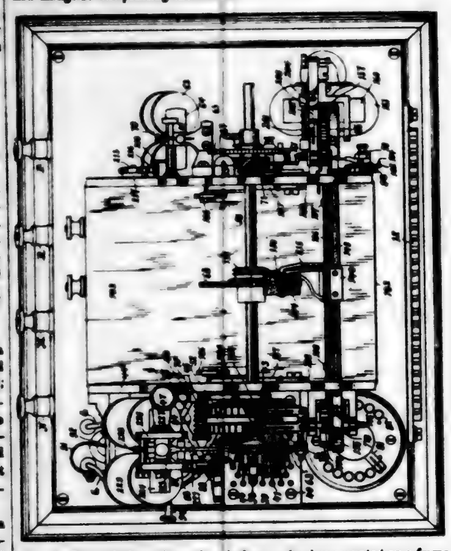
14. In a grinding-machine the combination of a grinding-wheel; a carriage movable in a direction perpendicular to the axis of the grinding-wheel; a vertically-adjustable spindle carried by the carriage; a clamp-socket carried by the spindle, and having a laterally-projecting arm; a casting supported on said arm; an arbor for a cutter-head carried by said casting, and means for adjusting the casting about the axis of its supporting-arm to a limited extent, and for clamping it securely to said arm.

15. In a grinding-machine the combination of a grinding-wheel; a carriage movable transversely with reference to the axis of the grinding-wheel; a vertically-adjustable spindle mounted on the carriage; a casting connected with and supported by said spindle and provided with a socket for one end of an arbor which supports a cutter-head; semicircular shoes entering recesses in that end of the arbor within the casting, and set-screws for preventing endwise movement of the shoes.

705,227. PRINTING-TELEGRAPH. THEODORE M. FOOTE, Brooklyn, N. Y., assignor to Western Telegraph Typewriting Machine Company, a Corporation of New Jersey. Filed Mar. 11, 1901. Serial No. 50,648. (No model.)

Claim.—1. In a printing-telegraph, printing mechanism mounted on a frame, means with the printing mechanism for connecting it electrically to another similar machine at a distant station, and a keyboard provided with a plurality of circuit-closing keys and with electric severed but connecting wiring connecting the keyboard detachably with the printing mechanism.

2. In a printing-telegraph, a frame, printing mechanism mounted in the frame, and electric conductors leading from the printing mechanism and having disconnecting-terminals, in combination with a keyboard provided with a plurality of movable circuit-closing keys, wires secured to the keyboard and having terminals adapted to be connected electrically by the keys to another electric conductor, said wires having disconnecting-terminals adapted to be connected electrically to the wires from the printing mechanism by placing the keyboard in a predetermined position alongside the printing mechanism.



3. In a printing-telegraph, printing mechanism mounted on a frame, electric-wire terminals connected with the printing mechanism and provided with terminals having sockets arranged on and at one side of the frame, a detached keyboard-frame, electric wires on the keyboard-frame having pin-terminals projecting from the frame and disposed to register with and enter and contact electrically with the socketed terminals on the frame of the printing mechanism.

4. In combination in a printing-telegraph, a rotatable type wheel, a shaft on which the type-wheel is splined, a worm-wheel tight on the shaft, a second shaft provided with a worm meshing with said worm-wheel, a worm-wheel loose on said second shaft, means for clutching the loose worm-wheel yieldingly, to the shaft, and a driven shaft provided with a worm meshing with said worm-wheel.

5. In combination in a printing-telegraph, an electric circuit for transmitting and receiving messages, a rotatable type-wheel splined on a shaft, a worm-wheel on said shaft, a second shaft geared by a worm to said worm-wheel on the type-wheel shaft, an electric motor, a shaft connected to and driven by said motor, said motor-driven shaft having a worm gearing with a worm-wheel on said second shaft, and a motor electric circuit leading from said message transmitting and receiving circuit through said motor.

6. In combination in a printing-telegraph, an electric circuit for transmitting and receiving messages, a rotatable type-wheel splined on a shaft, a worm-wheel on said shaft, a second shaft, an electric motor having a shaft driven thereby and geared through said second shaft to the worm-wheel on the type-wheel shaft, a motor electric circuit leading from said message transmitting and receiving circuit through said motor, a circuit-breaker in said motor-circuit, and a governor on said motor-driven shaft adapted by the too-rapid rotation of said motor-shaft to open said circuit-breaker in the motor-circuit.

7. In combination in a printing-telegraph, a type-wheel shaft, an electric-motor-driven shaft geared to said type-wheel shaft, an electric circuit including said motor, a shunt electric circuit leading from and into said motor-circuit, separable terminals in said shunt-circuit, a governor on said motor-shaft, and means connecting said governor mechanically to one of said separable terminals whereby by the too-rapid rotation of the motor-shaft the shunt electric circuit is opened.

8. In combination in a printing-telegraph, a main message-transmitting electric line, a plurality of local electric lines in and forming part of said main line, a series of keys one in each local line adapted to close said line electrically, a series of local-line contact-pieces arranged alternately in series overlapping each other to which said local lines are severally connected, and a circuit-closer adapted to connect said contact-pieces severally with the main line.

9. In combination in a printing-telegraph, a main message-transmitting electric line, a plurality of local electric lines in and forming part of said main line, a series of keys one in each local line adapted to close said line electrically, two series of local-line contact-pieces arranged annularly the pieces alternating with and overlapping each other, a concentric adjacent electric ring connected electrically to the main line, and a circuit-closer adapted to revolve exteriorly about said local-line contact-pieces and said ring and to close the circuit between the ring and said local contact-pieces severally.

10. In a printing-telegraph a disk of insulating material, two series of insulated local-line contact-pieces arranged annularly alternately in and about the disk, a main-line contact-ring in and about the disk and a circuit-closer revoluble about the disk adapted to contact with said ring and severally with said local-line contact-pieces.

11. In a printing-telegraph, an insulating-disk, two series of local-line contact-pieces located alternately and overlapping circumferentially in the periphery of the disk concentrically, and in insulation, and a line contact-ring fixed in said disk also concentric and of equal diameter with said two series of local contact-pieces.

12. In combination in a printing-telegraph, a circular disk of insulating material, a series of electric contact-pieces arranged at a distance apart on the periphery of said disk, a second series of electric contact-pieces on the periphery of the disk alternating and overlapping circumferentially with the contact-pieces of the first series, an adjacent electric ring on and about said disk insulated from said contact-pieces and a circuit-closer revoluble about said disk so disposed as to contact with said ring and severally with said contact-pieces alternately in each series thereof.

13. In a printing-telegraph, a main message-transmitting electric line, a plurality of local lines in and forming a section of the main line, a series of local-line contact-pieces arranged annularly at a distance apart, an adjacent main-line contact-ring concentric with said annular contact-pieces and provided with an insulated section in its periphery, a circuit-closer adapted to revolve about the ring and said contact-pieces, the construction being such that at one point in its revolution the contact of the circuit-closer with the ring is broken by said ring-insulating section.

14. In combination in a printing-telegraph, a series of electric contact-pieces severally forming a part of an electric circuit, said contact-pieces being arranged in a fixed annular series, an adjacent electric ring of equal diameter with and separated from but in the electric circuit with said several contact-pieces, a rotatable shaft having a type-wheel thereon provided with a number of type equal in number to the said electric contact-pieces, said shaft and type-wheel being adapted to rotate continuously completely or through a movement equal to any portion of a complete revolution, and a circuit-closer revoluble exteriorly about the annularly-disposed contact-pieces and the contact-ring and adapted to close the electric circuit between said ring and a contact-piece.

15. In combination in a printing-telegraph, a series of fixed electric local contact-pieces arranged in two alternating overlapping annular series, a type-wheel provided with a number of type equal to the number of said contact-pieces, an electric-circuit closer fixed mechanically to and rotatable with said type-wheel about a common axis, said circuit-closer being adapted to contact peripherally and severally with said contact-pieces and connect each severally to the other section of said electric circuit, and a series of electric-circuit-closing keys in the local electric circuits leading from said fixed electric contact-pieces.

16. In combination in a printing-telegraph, a main electric message-transmitting line, a series of circuit-closing keys in local lines forming a section of said main line, electric contact-pieces of said local lines arranged annularly, an adjacent electric contact-ring, a circuit-closer revoluble about and in electric contact with said ring and said contact-pieces, means other than the main electric circuit for rotating the circuit-closer, a shunt-circuit, and means adapted to automatically close the main circuit and open the shunt-circuit and hold said circuit-closer against rotation.

17. In a printing-telegraph a main message-transmitting electric line, a plurality of local lines in and forming a section of the main line, a series of local-line contact-pieces on said local lines arranged annularly at a distance apart, a type-wheel on a shaft and having characters corresponding in number with said local-line contact-pieces, a circuit-closer on said shaft arranged to sweep over and contact intermittingly severally with said local contact-pieces, means other than the main electric circuit for rotating the circuit-closer, and a shunt unison electric line having terminals adapted to engage said circuit-closer in an interim of its contact with a local-line contact-piece.

18. In a printing-telegraph, a main message-transmitting electric line, a series of local-line insulated contact-pieces arranged annularly, an adjacent concentric line-ring provided with an insulating-section in its periphery, a circuit-closer revoluble about the ring and local contact-pieces arranged to contact with the ring and severally with said local contact-pieces and intermittingly with the insulating-section in the ring thereby breaking the main-line circuit, means other than the main electric circuit for rotating the circuit-closer, and a shunt synchronizing electric circuit having terminals adapted to contact with said circuit-closer when out of contact with said ring.

19. In a printing-telegraph a main message-transmitting electric line, a series of local-line insulated contact-pieces arranged annularly, an adjacent concentric line-ring provided with an insulating-section in its periphery, a circuit-closer revoluble about the ring and local contact-pieces arranged to contact with the ring and severally with said local contact-pieces and intermittingly with the insulating-section in the ring thereby breaking the main-line circuit, means other than the main electric circuit for rotating the circuit-closer, a shunt synchronizing electric circuit having terminals adapted to contact with said circuit-closer when out of contact with said ring, an electromagnet in the shunt-circuit, and means actuated mechanically thereby for releasing the circuit-closer revolubly.

20. In combination in a printing-telegraph, a main electric line, local electric lines forming a part of the main line, contact-pieces of the local lines arranged annularly at a distance apart, a concentric main-line ring contact-piece provided with a section of insulating material, a concentric shaft, a circuit-closer mounted on the shaft and sweeping over the contact-pieces and the ring, a unison shunt electric line having terminals in the arc of but insulated from the local contact-pieces, a divided metal band about a disk of insulating material on said shaft, terminals in the electric main line which terminals contact with said band and intermittingly with the insulating material in the break in the band concurrently with the contact of the revoluble circuit-closer with the unison line contact-pieces.

21. In a combination in a printing-telegraph, a shaft, a circuit-closer mounted on a radial arm on the shaft, means for rotating the shaft, an electromagnet, a spring-held armature mounted on a bell-crank opposite said electromagnet, a catch on the bell-crank, and a second radial arm on said shaft, said catch being normally in the path of said second radial arm.

22. In a printing-telegraph, a main message-transmitting electric circuit, a revoluble type-wheel, a circuit-closer fixed to and revoluble with the type-wheel adapted to close the main circuit, shunt electric line provided with terminals and with an electromagnet, a printing-pad actuated by said electromagnet when the shunt-line is in action, an electromagnet in the main line, and means actuated by said last-enumerated electromagnet adapted to contact said terminals and close the shunt-line and to hold the type-wheel intermittently against revolution.

23. In a printing-telegraph, a main electric circuit, a rotatable type-wheel, an electromagnet in the main line, a movable printing-pad, an electric shunt-line provided with terminals and arranged to actuate the printing-pad, and a pivoted lever provided with an armature actuated by said electromagnet adapted to lock temporarily the rotation of the type-wheel and to close said shunt-line.

24. In a printing-telegraph, a main electric circuit, an electromagnet in said circuit, a revoluble type-wheel, an adjacent printing electric circuit, terminals in said printing-circuit, an armature opposite said electromagnet fixed on a tiltable arm, and means mounted on said arm for stopping the rotation of the type-wheel and for closing the printing-circuit.

25. In a printing-telegraph, a main electric circuit, a motor-circuit a motor in said motor-circuit, a revoluble type-wheel connected to and rotated by said motor, terminals in said motor-circuit, a pivoted swinging lever provided with a terminal contactor and circuit-closer, a ratchet-wheel, provided with means for swinging said lever in one direction, and means actuated by the type-wheel shaft adapted to rotate the ratchet-wheel by intermitting movement.

26. In a printing-telegraph, a main electric circuit, a motor-circuit, a motor in said motor-circuit, a revoluble type-wheel connected to and rotated by said motor, means for automatically closing and opening said motor-circuit, comprising terminals in the motor-circuit, a swinging spring-actuated lever provided with a terminal contactor and circuit-closer, a ratchet-wheel provided with a device adapted by rotation of the wheel to engage and swing said lever, a swinging arm provided with a pawl engaging said ratchet-wheel, and a rod pivoted to the swinging arm and riding on an eccentric on the type-wheel shaft adapted to vibrate said arm and pawl.

27. In a printing-telegraph, a rotatable type-wheel, an electric motor connected to and adapted to rotate the type-wheel, a motor-driving electric circuit comprising a section in two lines, a controller-switch at the junction of the line with the two section-lines arranged to limit and control the electric current through the two-line section, a circuit-breaker in one of the section-lines, and a governor on the motor-shaft adapted automatically to open and close the circuit-breaker.

28. In a printing-telegraph, a main electric circuit, a revoluble type-wheel, type-wheel-shifting mechanism, an electric circuit adapted when closed to lock the type-wheel, an electromagnet in the latter circuit, a paper-feed electric circuit, an electromagnet in the paper-feed circuit, and means actuated by the electromagnet in the paper-feed circuit for opening the type-wheel-locking circuit.

29. In a printing-telegraph, a main electric circuit, a revoluble type-wheel, means for revolving the type-wheel, type-wheel-shifting mechanism, a type-wheel-locking electric circuit, an electromagnet in the latter circuit, a paper-feed circuit, terminals in the paper-feed circuit, and means actuated by the revolving type-wheel for opening and closing the paper-feed circuit through said terminals.

30. In a printing-telegraph, a main electric circuit, a revoluble type-wheel, means for revolving the type-wheel, mechanism for shifting the type-wheel, a type-wheel-locking electric circuit, an electromagnet in the latter circuit, a paper-feed circuit, electric terminals in the paper-feed circuit, and means actuated by the means that shift the type-wheel for opening and closing the paper-feed circuit through said terminals.

31. In a printing-telegraph, a main electric circuit, a paper-feed electric circuit, devices actuated by the paper-feed circuit for feeding the paper, devices actuated by a motor for automatically closing the paper-feed circuit, said motor connected electrically to said last-enumerated devices, a shunt-circuit in the paper-feed circuit, and a key for closing the shunt paper-feed circuit.

32. In a printing-telegraph, a type-wheel shaft, a type-wheel splined thereon, an independent electric motor geared to and rotating said shaft, means for shifting the type-wheel intermittingly on its shaft comprising a shaft parallel with the type-wheel shaft, a shiftable block on said parallel shaft and connected to the type-wheel, a strap attached to the block, a winding-up wheel, a ratchet-wheel rigid to the winding-up wheel, a pawl engaging the ratchet-wheel, an armature-arm on which the pawl is pivoted, and means for actuating the armature-arm.

33. In a printing-telegraph, the combination with a type-wheel shaft, a type-wheel splined thereon, and an independent motor geared to and rotating with said shaft, of means for shifting the type-wheel comprising, a shiftable block connected to the type-wheel, a strap attached to the block, a winding-up wheel, a ratchet-wheel rigid to the winding-up wheel, a pawl engaging the ratchet-wheel, a dog engaging the ratchet-wheel in one direction, a slidable rod adapted to engage the pawl and the dog and disengage them from the ratchet-wheel, and means for automatically actuating the disengaging-rod.

34. In a printing-telegraph, the combination with a type-wheel shaft, a type-wheel splined thereon and an independent motor geared to and rotating said shaft, of means for shifting a type-wheel comprising, a shiftable block connected to the type-wheel, a strap attached to the block, a winding-up wheel means for actuating the winding-up wheel, a second strap attached to the block and running in the opposite direction, a winding-up wheel on which said second strap runs, and means for rotating the latter winding-up wheel.

35. In a printing-telegraph, the combination with a type-wheel shaft, a type-wheel splined thereon, and an independent motor geared to and rotating said shaft, of mechanical means for shifting the type-wheel intermittingly in one direction, an electric type-wheel-shifting circuit employed in shifting the type-wheel intermittingly, means for retrieving the type-wheel, and means for automatically opening the type-wheel-shifting circuit comprising terminals in the circuit, a circuit-closer mounted on a shiftable rod, stops on the rod, and means shifting with the type-wheel adapted to engage a stop on said rod and shift the circuit-closer closing the electric circuit and releasing the mechanism that shifts the type-wheel intermittingly.

36. In a printing-telegraph, a shiftable type-wheel, a strap connected to the type-wheel, a winding-up wheel provided with a ratchet-wheel, a pawl engaging the ratchet-wheel and pivoted on an armature-arm provided with an armature, an electromagnet in a normally closed electric circuit opposite said armature, means for opening and closing the circuit, and a spring holding the armature normally away from the electromagnet.

37. In a printing-telegraph, a main electric line, a shaft, a type-wheel on and rotatable with the shaft, an electric motor independent of the main electric line geared to and for rotating said shaft, a motor electric circuit provided with terminals, a swinging circuit-breaker in said motor-circuit, and means actuated mechanically by said type-wheel shaft for automatically swinging said circuit-breaker.

38. In a printing-telegraph, a shaft, a type-wheel on and rotatable with the shaft, an electric motor geared to and for rotating said shaft, a motor electric circuit, a circuit-breaker in said motor-circuit, and means for automatically opening said motor-circuit comprising a ratchet-wheel a swinging arm provided with a pawl engaging said ratchet-wheel, a rod riding on an eccentric on the type-wheel shaft and connected to said swinging arm, a circuit-closer mounted on a swinging arm, and means by which said ratchet-wheel actuates the circuit-closer and swinging arm and throws the circuit-closer out of contact with terminals in said motor electric circuit.

39. In combination in a printing-telegraph, means for automatically opening a motor-circuit comprising a ratchet-wheel, a pawl mounted on a swinging arm adapted to rotate said ratchet-wheel, means for actuating the pawl, a swinging arm disposed to be engaged and actuated by a pin on the ratchet-wheel, a switch-arm pivoted concentrically with said swinging arm, a pin and a spring on said switch-arm holding the swinging arm thereto yieldingly, and a circuit-closer on the switch-arm contacting with terminals in the motor-circuit and adapted to be released therefrom breaking the circuit by the rotation of the ratchet-wheel in one direction.

40. In combination in a printing-telegraph, means for automatically opening and closing a motor-circuit comprising an oscillating ratchet-wheel a pawl mounted on a swinging arm adapted to rotate said ratchet-wheel in one direction, means for actuating the pawl, a spring secured to and adapted to retrieve the ratchet-wheel, a swinging arm disposed to be engaged and actuated by the ratchet-wheel, a switch-arm pivoted concentrically with said swinging arm, a pin and a spring on said switch-arm holding the swinging arm thereto yieldingly, and a circuit-closer on the switch-arm contacting with terminals in the motor-circuit and adapted to be released therefrom breaking the circuit by the rotation of the ratchet-wheel in one direction.

41. In a printing-telegraph, a revoluble ratchet-wheel, means including a reciprocating pawl for rotating the ratchet-wheel in one direction, a spring-actuated rock-shaft, a back-stop mounted on said rock-shaft and engaging said ratchet-wheel, a second rock-shaft provided with a radial arm engaging a radial arm on the first-enumerated rock-shaft, an armature mounted on a radial arm on said second rock-shaft, and an electromagnet in an electric circuit adapted when the circuit is closed to draw said armature thereto.

42. In a printing-telegraph, a type-wheel shaft, means rotating said shaft, a paper-feed electric circuit, a shunt in said circuit provided with normally open terminals, and means for automatically closing said shunt-circuit comprising a rotatable ratchet-wheel, means for rotating the ratchet-wheel, a radial arm fixed to the hub of the ratchet-wheel and provided with a finger tiltable in one direction only, a rock-shaft, an arm on the rock-shaft in the path of said finger, a spring-held circuit-closing lever, and a rod connecting the lever with a radial arm on said rock-shaft.

43. In a printing-telegraph, a paper-feed mechanism, comprising a rotatable shaft, spur-toothed wheels on said shaft, pressure-rolls opposite said spur-wheels, a fixed crown-toothed wheel on the shaft, a loose complementary crown-toothed wheel on the shaft and provided with a pinion, a swinging spring-actuated armature-arm provided with a segmental rack meshing with said pinion, an armature on the armature-arm, and an electromagnet in an electric circuit disposed to attract and hold said armature thereto against the pull of the spring when the electric circuit is closed through the electromagnet.

44. In a printing-telegraph, a main electric circuit, a paper-feed electric circuit, an electromagnet in the paper-feed circuit, an oscillating spring-held armature-arm provided with an armature adjacent to and actuated by said electromagnet and with a segmental rack, a shaft provided with spur-toothed paper-feed wheels, a pinion on said shaft in mesh with said segmental rack, and means connecting the pinion revolubly and slipably in one direction to said shaft.

45. In a printing-telegraph, a main electric circuit, a revoluble type-wheel, a motor connected mechanically to the type-wheel for rotating it, a motor electric circuit, a shunt electric circuit terminals in the shunt-circuit, a circuit-closer, and means on the motor-shaft adapted under rapid rotation of the motor-shaft to open the shunt-circuit.

46. In a printing-telegraph, a main electric circuit, a revoluble type-wheel, a motor connected mechanically to the type-wheel for rotating it, a motor electric circuit, terminals in the motor-circuit, a circuit-closer, a speed-actuated governor on the motor-shaft, a revoluble insulated metal disk fixed on a collar forming a part of and actuated by said governor and against which disk said terminals bear normally, and means for holding one of said terminals from following the disk when it is withdrawn by the governor, thus breaking the circuit.

47. In a printing-telegraph, an electric motor, a motor electric circuit, a speed-actuated governor on the motor-shaft, an insulated metal disk movable by said governor adapted to serve as an electric-circuit closer, terminals in said electric circuit, one of which terminals bears constantly against said disk, the other terminal being spring-held normally against said disk, and a finger adapted to serve as a stop to prevent said second terminal from following said disk when it is withdrawn from the governor thus breaking the electric circuit.

48. In a printing-telegraph, an electric motor, a motor electric circuit, a speed-actuated governor on the motor-shaft, an insulated metal disk movable by said governor adapted to serve as an electric-circuit closer, terminals in said electric circuit contacting normally with said disk and closing said circuit, a spring-arm bearing against the end of the motor-shaft and following its play and on which spring-arm one of said terminals is mounted elastically, a finger also mounted on said spring-arm adapted to engage the terminal and hold it back against the resiliency of its own spring, and means between said finger and said spring-arm for regulating the position of the finger relative thereto.

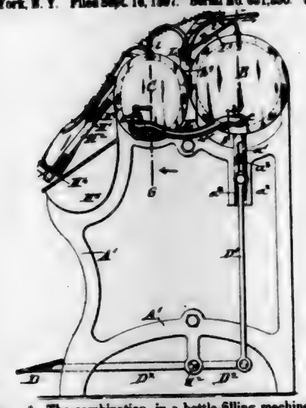
705,228. PRINTING-DIE. WILLIAM A. POSER, New York, N. Y. Filed Jan. 2, 1902. Serial No. 88,134. (No model.)

Claim.—1. A metallic handle for type-blocks provided with flanges, set in position to embrace a type-block, and adapted to be brought into rigid, unyielding engagement with the block when pressed together.

2. A metallic handle for type-blocks, provided with flanges, having gripping edges on their ends, the flanges being set in position to embrace a type-block and adapted to be brought into rigid, unyielding engagement with the block when pressed together.

3. The combination with a metallic handle, having flanges set in position to embrace a type-block and adapted to be brought into rigid, unyielding engagement with the type-block, when pressed together, of a type-block set between the flanges and secured to the handle by pressing the flanges together upon the type-block.

705,229. MACHINE FOR FILLING BOTTLES. BRUCE M. GLASGOW, New York, N. Y., assignor, by mesne assignments, to Emile Risser, New York, N. Y. Filed Sept. 16, 1897. Serial No. 651,520. (No model.)



Claim.—1. The combination, in a bottle-filling machine, of a supporting-frame, a receiving-cylinder, a delivery-cylinder, a flexible pipe for connecting the receiving and delivery cylinders, and means for raising or lowering the receiving-cylinder relatively to the delivery-cylinder, substantially as set forth.

2. The combination, in a bottle-filling machine, of a supporting-frame, a vertically-guided receiving-cylinder, a delivery-cylinder, a flexible connecting-pipe between the receiving and delivery cylinders, and a treadle-operated lever mechanism adapted for adjusting the receiving-cylinder relatively to the delivery-cylinder, for increasing or decreasing the pressure of the liquid in the receiving-cylinder on the liquid in the delivery-cylinder, substantially as set forth.

3. In a bottle-filling machine, the combination of a supporting-frame, of a vertically-guided receiving-cylinder, a delivery-cylinder in front of the same, a flexible pipe connecting the receiving and delivery cylinders, means for raising and lowering the receiving-cylinder relatively to the delivery-cylinder, and means for clamping the receiving-cylinder into the position to which it is adjusted, substantially as described.

4. In a bottle-filling machine, the combination of a receiving-cylinder and a delivery-cylinder, a valved pipe connecting the receiving-cylinder with the delivery-cylinder, and a delivery-pipe extending through the delivery-cylinder near the bottom of the same and provided with a longitudinal slit in its lower part for supplying the liquid freely and without foaming to the delivery-cylinder, substantially as set forth.

5. In a bottle-filling machine, the combination, with a delivery-cylinder having a ledge at the lower part of the same and an inlet-pipe connected with a suitable supply and arranged just above said ledge and discharging the liquid away from the edge of the ledge, of oscillating siphon-tubes passing through the upper part of said cylinder, and a guide-strip on said ledge provided with as many recesses and cushion-blocks as there are siphon-tubes, for closing the lower ends of the siphon-tubes when they are pressed against the same, substantially as set forth.

6. In a bottle-filling machine, the combination, with a delivery-cylinder, of a siphon-tube passing through an enlarged opening in the cylinder, a plate secured to the cylinder, a gland for the tube, pivot-pins or trunnions for said gland, said pivot-pins being mounted adjustably in said plate, and an elastic gasket confined between said plate and cylinder for yieldingly supporting the gland and siphon-tube, substantially as set forth.

7. In a bottle-filling machine, the combination, with the delivery-cylinder having openings in its upper part, of oscillating siphon-tubes extending through said openings, gaskets placed over said openings, glands extending over gaskets, means for tightly applying the siphon-tubes to said glands, covering-plates provided with sockets at diametrically opposite points, and pivot-pins or trunnions passing through said sockets into the glands, substantially as set forth.
